About the Editors

Editor

G. Kurt Piehler is director of the Institute on World War II and the Human Experience and associate professor of history at Florida State University. Prior to becoming the institute director in 2011, he held academic positions at the City University of New York, Drew University, Rutgers University, and the University of Tennessee. In 2008, he served as Fulbright Lecturer in American Studies at Kobe University and Kyoto University. As founding director (1994–1998) of the Rutgers Oral History Archives, he conducted more than 200 interviews with veterans of World War II. Many of these interviews can be found on the Internet at oralhistory.rutgers.edu. His televised lecture, “The War That Transformed a Generation,” which drew on the Rutgers Oral History Archives, appeared on the History Channel in 1997.

Piehler is the author of *Remembering War the American Way* (1995) and *World War II* (2007). He is editor of *The United States in World War II: A Documentary Reader* (2013) and co-edited *The United States and the Second World War: New Perspectives on Diplomacy, War, and the Home Front* (2010); *The Atomic Bomb and American Society: New Perspectives* (2009); and *Major Problems in American Military History* (1999). He served as associate editor of *Americans at War: Society, Culture, and the Home Front* (2005) and consulting editor of the *Oxford Companion to American Military History* (1999). Piehler edits two book series: *World War II: The Global, Human, Ethical Dimension* (Fordham University Press) and *Legacies of War* (University of Tennessee Press).

Currently, Piehler is working on a book examining the religious experiences of American

servicemen and servicewomen in World War II. For this project, he has received research grants from the American Jewish Archives, Mary Baker Eddy Library, Presbyterian Historical Society, Rockefeller Archive Center, and U.S. Army Heritage and Education Center. His article “World War II and America’s Religious Communities” appeared in *The Cambridge History of Religions in America* in 2012.

Born in Nyack, New York, Piehler attended public schools in the Fresh Meadows neighborhood of Queens, New York City, and later at Mount Arlington and Roxbury, New Jersey. A Phi Beta Kappa graduate of Drew University, he holds a master’s degree and doctorate in history from Rutgers University. He resides with his family in Tallahassee, Florida.

Associate Editor

M. Houston Johnson V is assistant professor of history at the Virginia Military Institute. He grew up in Roanoke, Virginia, and attended Roanoke College, graduating magna cum laude with a BA in history, philosophy, and religion. Johnson did his graduate work at the University of Tennessee, Knoxville, where he specialized in the history of American aviation. His dissertation, *Taking Off: The Politics and Culture of American Aviation, 1918–1939*, examines the government’s role in promoting commercial flying. He has presented work at the American Historical Association annual meeting, and he has received grants to support his research from organizations such as the Gilder Lehrman Institute of American History, the Herbert Hoover Presidential Library Association, and the Pan Am Historical Foundation.

Introduction

The *Encyclopedia of Military Science* is intended to offer an interdisciplinary perspective on the nature of modern warfare. It is aimed at those serving in the armed forces, as well as those training to enter the profession of arms in a service academy, an ROTC program, or an officer candidate school. It will inform scholars and students with diverse interests in military science, especially in the disciplines of history, political science, international relations, sociology, psychology, anthropology, and the humanities. This work embraces the sentiment of the French leader Georges Clemenceau who declared that war was too important to be left only to generals, and it seeks to inform government leaders and average citizens who must, under the system of government in the United States, make the ultimate decisions regarding the use of coercive force. For journalists who write about issues of war and peace, it is envisioned that this encyclopedia will serve as a ready reference and background information on the complex nature of military science.

Scholars from a diverse range of disciplines such as history, political science, sociology, psychology, philosophy, literary studies, anthropology, philosophy, and peace studies have contributed to this volume. Given its broad range of contributors, many of whom are active-duty or retired members of the American armed forces, it will interest a broad range of scholars and students interested in a better understanding of military science. The list of contributors is international in scope and includes authors from Brazil, Canada, Colombia, Germany, Great Britain, India, Japan, Lithuania, Singapore, and Taiwan.

In his overview essay in this encyclopedia examining military science, Kelly Jordan observes that military science is a “systemized body of knowledge regarding and related to the theory, application, and employment of military units and weapons in land warfare.” This encyclopedia takes an even broader

view of military science and has a number of entries focusing on naval science and homeland security.

Armed Forces and American Society

This work devotes significant attention to civil-military relations. Under the U.S. Constitution, command of the American military is vested in a civilian, the president, who serves as commander in chief. Only the U.S. Congress can establish the armed services, and it must appropriate funds for its operation. The U.S. Senate must also confirm the appointment of all officers commissioned to serve in the armed forces. Although the Constitution delegates the responsibility to declare war to Congress, the last time the United States actually declared war against another nation occurred during World War II. For instance, American intervention in the Korean War (1950–1953) and the Persian Gulf War (1991) was based on American adherence to the call of the United Nations to enforce collective security and to repel aggression.

Since the founding of the republic, presidents have asserted the right to deploy American forces to defend American national security without explicit congressional authorization. During the early 1900s, the United States directly intervened in the internal affairs of Cuba, Haiti, and countries in Central America. More recently, presidents have intervened in Panama, Bosnia, Haiti, and Somalia without seeking congressional approval.

In the aftermath of the Vietnam War, Congress sought to rein in the power of the president through the passage of the War Powers Act. Although Congress has the ability to halt military operations by withholding appropriations to fund them, it has seldom adopted this tactic. With few exceptions, the Supreme Court has been reluctant to take cases that would require it to define the war-making power of Congress versus the role of the president as commander in chief.

If there is one lesson from the terrorist attacks of September 11, 2001, on the World Trade Center in New York City and the Pentagon it is that the military alone cannot halt terrorism. As a result, this encyclopedia takes an expansive view of military science and includes a range of articles dealing with homeland security and the vital role of civilian agencies, including articles on the Border Patrol, Central Intelligence Agency, Federal Bureau of Investigation, and the Department of Homeland Security. A number of articles center on the U.S. Coast Guard, which has a long history in the area of homeland security. The Coast Guard, while a uniformed service, is part of the Department of Homeland Security, and only in wartime is it under the control of the Department of Defense. In contrast to the other branches of the armed services, the Coast Guard routinely enforces a range of maritime and other laws, especially in the area of drug smuggling, environmental protection, and immigration.

The role of the military in American society is complex. Military spending consumes a substantial part of the federal budget and has a significant impact on the broader economy. In many regions of the country, military bases play an important role in the economic life of many small communities. As a result, efforts by the Department of Defense to close redundant bases proved difficult until Congress delegated substantial authority regarding base realignment and closure to an independent commission that determines which bases within the United States should be open and which should be closed.

Since Reconstruction and passage of the Posse Comitatus Act, the U.S. Armed Services, with the exception of the Coast Guard, have seldom engaged in civilian law enforcement. There are important exceptions, however. Presidents have intervened on a number of occasions in cases of civil disorder when civilian law enforcement authorities were overwhelmed. The military, especially the National Guard, has also played a vital role in responding to humanitarian disasters. Since the early 1800s, the U.S. Army Corps of Engineers has built and maintained a number of public works projects, especially in the areas of flood control and navigation.

Organization and Commands

This encyclopedia provides an overview of the major branches of the American military—the U.S.

Army, U.S. Navy, U.S. Marine Corps, and U.S. Air Force. Organizationally and culturally, the different branches of the military remain quite distinct. At the same time, the growing pattern since World War II has been to encourage greater interservice cooperation and unified commands that span the services. The National Security Acts of 1947 and 1950 created a unified Department of Defense headed by a secretary of defense, as well as the National Security Council, to better coordinate foreign and defense policy. Under the Goldwater-Nichols Department of Defense Reorganization Act, the power of the Joint Chiefs of Staff was strengthened, especially that of the chairman of the Joint Chiefs of Staff. Interservice joint commands have emerged as the norm for projecting American military and naval power, and this work includes articles on several of the most significant ones including the U.S. Africa Command, U.S. Central Command, U.S. Northern Command, U.S. Pacific Command, and U.S. Southern Command.

Military Education and Training

Despite its importance, military training and education have received relatively little attention from scholars. This encyclopedia includes broad overview articles focusing on the training of officers and enlisted personnel for all the armed services, as well as the ROTC program. Entries appear on all the service academies for the American armed forces including the U.S. Military Academy, U.S. Naval Academy, U.S. Air Force Academy, and U.S. Coast Guard Academy. The work also includes entries examining the major postgraduate institutions such as the Army War College, Naval War College, Naval Postgraduate School, and National Defense University.

Military training and education are designed not only to provide essential skills and knowledge but also to cultivate the traits of leadership. Officers and noncommissioned officers, by virtue of their position, are to serve as leaders. This encyclopedia includes a range of articles on leadership, including articles focusing on squad leadership, staff relationships, and military command staffs.

Military Theory and Strategists

The editor and associate editor of this encyclopedia are historians, and this reference work bears this imprint. From time immemorial, military leaders

have looked to history for lessons from the past and for the critical skills garnered from the study of this discipline. Two articles provide an overview of differing approaches to military and naval history.

This work also includes overview articles on the fields of anthropology, literature and war, religion and war, sociology, and political science/international relations. The social sciences provide valuable analytical concepts useful for considering the role and value of using force to further political ends; the encyclopedia includes entries on several of these, including deterrence, realism, and soft power.

The encyclopedia contains analytical biographies of a number of military leaders, strategists, and scholars who have offered insights into the art and nature of war, including articles on Sun Tzu, Thucydides, Frederick II of Prussia, Carl von Clausewitz, Antoine-Henri Jomini, Alfred Thayer Mahan, Vo Nguyen Giap, and Mao Zedong. Special weight has been given to contemporary military theorists such as Samuel Huntington, Edward N. Luttwak, S. L. A. Marshall, John Keegan, and Victor Davis Hanson.

Waging War

This encyclopedia considers war from the strategic, operational, and tactical perspectives. Comprehensive articles examine strategy from the perspective of air power, ground power, naval power, and nuclear weapons. The varied nature of warfare is analyzed, with separate articles on amphibious, biological, electronic, psychological, submarine, surface, and unconventional warfare. Other articles provide an overview of tactics as applied in the air, on the ground, and on the water.

The work also considers the weapons systems and munitions needed to wage warfare by the U.S. Armed Forces. There are articles dealing with anti-aircraft, biological, chemical, nonlethal, nuclear, and space weapons. More specialized articles consider the range of aircraft (antisubmarine, bomb, carrier, fighters, patrol, reconnaissance, and transport) employed by the armed services, warships (aircraft carriers, destroyers, frigates, submarines), missiles (air-to-air, conventional, cruise, nuclear), artillery, and mines (land and sea).

As the entry on research and development notes, weapons systems and munitions require significant investment by the federal government, especially

given the complex nature of weapons technology. Military contractors provide the bulk of munitions needed by the armed forces, and this encyclopedia contains a brief overview of the most significant defense contractors. During the current wars, there has been a growing reliance on outside contractors not only to supply military hardware and munitions but also to take over many of the functions previously undertaken by the armed forces. For instance, private contractors such as Blackwater employed civilians to run mess halls used by U.S. troops in Afghanistan and Iraq, used civilian drivers and guards to move cargoes in war zones, and even provided civilian guards to protect American diplomatic personnel stationed abroad.

Military Life

Legally and culturally, those serving in the armed forces lead a different life from their civilian counterparts. Members of the armed forces take an oath of allegiance to obey lawful orders from their civilian and military commanders. They serve in an institution that controls virtually every aspect of their lives, from the uniforms they wear to the food they eat and equipment they carry as part of their combat load. Specific customs, traditions, and even a different language serve to reinforce the distinctive features of military life. Members of the military and their dependents have their own health care plan—TRICARE. Issues of personal finance present a number of challenges to servicemen and servicewomen, as well as dependents of service members. The military still provides retirement income in the form of a pension to members who serve the requisite number of years to qualify. For servicemen and servicewomen who are disabled as a result of military service, there is a separate disability system.

Frequent deployments during the Iraq War and the War in Afghanistan have placed great stress on military families. In contrast to earlier eras, the military has been more conscious of the need to promote family readiness, but despite informal and formal support groups such as the National Military Family Association, the strain of military life on the family is substantial. This encyclopedia includes a number of entries describing aspects of life in the military across the lifespan, including articles on personal finance, discharge and separation, and retirement.

Diversity

The U.S. military today is a diverse institution that draws men and women from a variety of different races, ethnicities, and sexual orientations. This is not a new tradition. For instance, African Americans have a record of military service that dates back to the colonial era and the American Revolution. At the same time, they have endured generations of discrimination and segregation. Only after World War II did the federal government and the military end segregation and adopt policies that offered equal opportunity to both Black and White servicemen.

There is an equally long tradition of other ethnic groups serving in the armed forces. Entries in this work examine the service of Arab Americans, Asian Americans, Latinos, and Native Americans. Gays and lesbians have also served for generations in the military service, although until the repeal of Don't Ask, Don't Tell, they could not serve openly.

The underrepresentation of women in today's military demonstrates a legacy of institutional and wider societal discrimination. Women have participated in virtually every American war, during the eighteenth and nineteenth centuries mainly as camp followers or illicitly serving in the ranks by disguising themselves as men. Women were not allowed to serve in uniform as nurses until the army and navy created the Nurse Corps after the Spanish-American War. Not until World War II did all the services make a systematic effort to bring women into the uniformed ranks, although they continued to restrict them from the combat ranks. With the rise of the all-volunteer army in the 1970s, the number of women in the ranks grew, and more occupational specialties opened up to them. Not until the Persian Gulf War and its aftermath did prohibitions against women serving in combat start to end, beginning with the U.S. Air Force and U.S. Navy. Given the nature of the recent wars in Afghanistan and Iraq with their lack of clear front lines, an increasing number of women serving with ground forces participated in combat operations. Women were seen by the army and Marine Corps as especially valuable in interacting with women civilians in both countries. Articles examining women's service in the military and related entries on rape and sexual trauma are especially timely as the armed forces work toward the full integration of women into all the combat arms.

Law and Questions of Military Justice

To wage war successfully requires calculated violence, restraint, and an adherence to the laws of war. The laws of war that have governed the conduct of war for centuries draw heavily on customary usage and precedent. Since the late 19th century there has been a concerted effort to codify the laws of war through international treaties. Among the most significant are the Hague and Geneva Conventions, which seek to ensure the protection of civilians and the safety of prisoners of war and the wounded in battle. Since the American Revolution, American political and military leaders have stressed the need to adhere to the laws of war. This encyclopedia includes entries on these conventions as well as articles on genocide, human rights, and war crimes that place the laws of war in a broader context.

Responsibility for the enforcement of the laws of war has traditionally resided in the actions of sovereign nations. For instance, during the Vietnam War, the United States held a war crime trial to try the perpetrators of the My Lai Massacre. After World War II, special temporary international courts were created to try German (Nuremberg War Crimes Trial) and Japanese (Tokyo War Crimes Tribunal) war criminals. Although the United States played a pivotal role at Nuremberg and Tokyo and supported the creation of ad hoc international courts to try war criminals from Yugoslavia and the Rwandan genocide, it has refused to accept the jurisdiction of the recently created International Criminal Court.

This encyclopedia also includes entries on U.S. military law and the military justice system. Under the U.S. Constitution, Congress is authorized to establish a distinct military system of justice that grants servicemen and servicewomen fewer constitutional rights than civilians. On the most basic level, they cannot leave the military without an official discharge and can be charged with the crime of desertion for trying to quit the service before their term of enlistment ends. Military personnel are subject to the Uniform Code of Military Justice and a separate judicial system. Soldiers are tried not in a court of law but through courts martial. If convicted of a crime under the Uniform Code and incarcerated, they serve time in a military prison. The armed forces also maintain their own law enforcement agencies to enforce the Uniform Code.

Military Values, Ethics, and Culture

If there is a normative bias to this work, it is the belief that military service is an honorable profession and that ethics and ethical judgments play an important role in guiding men and women who serve their nation in uniform. Civil-military relations have traditionally been governed in the United States by military leaders obeying and executing lawful orders issued by the president, the secretary of defense, and other civilian leaders. In contrast to many countries where military officers pledge allegiance to a monarch or other national leader, military officers and enlisted men take an oath of enlistment in which they pledge to defend and protect the Constitution of the United States from all enemies foreign and domestic.

Since elected civilian leaders ultimately commit the United States to war, it is important that all citizens have a basic understanding of military science. Although the just war tradition has been influential in shaping the reasons why and when nations in the Western tradition resort to war, until the 20th century there were few restrictions in the laws of war limiting the ability of sovereign nations to wage war. As a result of the terrible destructiveness of World War I and World War II, there has since been a concerted effort to consider wars of aggression as illegal under the laws of war. This has been codified in treaties the United States has signed and ratified, most notably the Kellogg-Briand Pact and the United Nations Charter.

Contemporary Events

If one were to periodize American military history, one could argue that there has been a significant change since 1940 regarding the deployment and use of American military power. Prior to the Spanish-American War and the Philippines Insurrection, the United States seldom deployed significant land forces beyond the Western Hemisphere. Although the United States entered World War I, it did not join the League of Nations after the conflict ended. World War II witnessed an unprecedented mobilization of American society; 15 million men and women served in the armed forces and were deployed throughout the globe to meet the threat of Nazi Germany, Fascist Italy, and Imperial Japan. In the aftermath of World War II, the United States joined the United Nations, and during the Cold War, it signed a series of political and military alliances. Perhaps the most significant of these alliances was

the North Atlantic Treaty Organization (NATO) wherein the United States joined Canada and a number of Western European countries in a system of mutual security. Initially formed to meet the threat of communism and to deter possible aggression, NATO has survived the collapse of the Berlin Wall, the reunification of Germany, and the collapse of the Soviet Union. In the post-Cold War era, NATO mounted operations to protect Kosovo and to fight terrorism in Afghanistan after 9/11.

The end of the Cold War marked a reordering of American foreign and defense policy. In the heady days following the collapse of the Berlin Wall in 1989, talk in political and intellectual circles concerned the peace dividend that would come from the dramatic downsizing of the U.S. military. There would be a modest peace dividend in the 1990s, and several significant changes did occur after the 1991 Persian Gulf War. Both the United States and Russia, the successor state to the Soviet Union, dramatically downsized their nuclear arsenals. The United States withdrew a substantial number of military and naval forces from Europe, most notably from Germany.

U.S. engagement with the Middle East has been long-standing, and the United States has been an ally of Israel for over a generation. But the rise to power of a theocratic Islamist regime in Iran, the invasion of Kuwait by Iraq in 1989, and the aftermath of the Persian Gulf War led to increased deployment of American forces in the region. The attacks of 9/11 led to a dramatic increase in military spending as the United States fought wars to overthrow the Taliban in Afghanistan in 2001 and to topple the regime of Saddam Hussein in Iraq. Despite embarking on two long wars, the United States did not adopt conscription but relied on an all-volunteer army to fill the ranks. Limited manpower required servicemen and servicewomen, especially those in the army and Marines, to undertake multiple combat deployments. To ensure small unit cohesion, stop-loss orders required men and women whose term of service was ending to remain with their units if they were called up for overseas deployment. The military in the Persian Gulf War, Iraq War, and War in Afghanistan relied heavily on reservists and National Guard units.

In the aftermath of the Vietnam War, the U.S. Army generally focused on preparing for a major conventional war against the Soviet Union and generally neglected preparing for counterinsurgency

warfare. Although the United States quickly toppled the Taliban regime in Afghanistan and Saddam Hussein in Iraq, the military was ill prepared for the occupations and the insurgencies that followed. In the case of Iraq, General David Petraeus implemented a new counterinsurgency strategy, the surge, that dramatically improved the security of the civilian population in the country and diminished insurgent attacks. The success of the surge allowed the United States to withdraw armed forces from Iraq by the end of 2011. Although a similar counterinsurgency strategy was implemented in Afghanistan in 2009, it is uncertain if the United States will achieve the same success.

Media, Military, and the Public

An independent, free, and unfettered press is a central hallmark of democratic society. In the United States, there is a long tradition of American journalists covering war that dates back to the 19th century. Not until World War I did the federal government and the armed forces institute formal censorship of war reporting, establishing a precedent that would be invoked in later conflicts. World War I set other important precedents, including the federal government's establishment of the first formal propaganda effort to convince Americans to support America's first land war in Europe.

The news media have often been quite supportive of U.S. war aims, even during such divisive conflicts as Vietnam. But it was during the Vietnam War that relations between the media and the military soured. Some critics within the armed forces and the U.S. government blamed the critical press coverage of the Vietnam War for causing America's loss or, more accurately, forcing America's withdrawal from Indochina in 1973. As a result, the U.S. military adopted policies after Vietnam that limited reporters' access to the battlefield in Grenada, Panama, and the Persian Gulf War. During the wars in Afghanistan and Iraq, restrictions loosened, and the military increasingly allowed journalists to embed with units.

The Internet has led to a widespread shift in the relationship between the military, journalists, and the public. For the news media, the Internet has placed pressure on traditional news media outlets, especially print newspapers, but also on network television. It has sped up the news cycle since the Internet allows print, images, and videos from a war

zone to be transmitted back to the United States instantaneously. Censorship is more difficult to implement and can easily be subverted. For instance, in the Global War on Terrorism, terrorists have made widespread use of the Internet to disseminate their message and to recruit adherents.

This encyclopedia contains a number of entries dealing with the news media, the military, and the public. It also includes articles on broader depictions of war in literature, television, and war films.

Development of the Encyclopedia

The idea for this encyclopedia originated with Jim Brace-Thompson, acquisitions editor from SAGE, after he spoke to a number of college and university librarians who suggested a need for a reference work that examined military science. G. Kurt Piehler was approached about the possibility of editing such a project in 2007 and conducted preliminary research that confirmed the need for a comprehensive work examining war and military affairs from a broad, interdisciplinary perspective. After returning from a Fulbright Fellowship in Japan in August 2008, Piehler formed an advisory board to help formulate the parameters of the project and develop a table of contents. Members of the advisory board were generous with their time, and a number contributed entries in addition to reading articles in their area of expertise when requested by the editor.

M. Houston Johnson V played a central role in every aspect of the encyclopedia's development, especially in helping identify and contact potential authors. In his role as associate editor, Johnson had primary responsibility for editing a number of entry categories, including Intelligence, Logistics, Supply, Equipment Transportation, Military Organizations and Commands, Tactics, Weapons Systems, and Weapon Contractors. As editor, Piehler reviewed every one of the 520 entries and nearly 1.1 million words. In addition to the A–Z entries, this encyclopedia includes materials in the back matter that touch on civil-military relations, military ideals, laws of war, U.S. Supreme Court cases related to war, U.S. military organizations, and casualties.

Assembling authors for this project was difficult. On several occasions, authors needed more time to complete an entry because they were deployed either to Afghanistan and Iraq. Even if not deployed

to a war zone, members of the armed forces have many responsibilities and demands on their time. The editor and associate editor of this encyclopedia want to express our appreciation to all who contributed to this work, but especially to servicemen and servicewomen who have shared their expertise with a wider audience. While this work has a

number of audiences, we believe one of the most important are those in uniform or those who aspire to serve in the armed forces of the United States of America.

G. Kurt Piehler and M. Houston Johnson V

ABU GHRAIB

The controversy surrounding the 2004 prisoner abuse scandal at Abu Ghraib prison near Baghdad, Iraq, drew worldwide attention to the treatment of prisoners held by U.S. forces occupying that country. The graphic images of torture first released during a *60 Minutes* broadcast and later published in the *New Yorker* magazine prompted worldwide protest against U.S. interrogation policies and raised a number of questions about the complicity of the executive branch and the Department of Defense in the abuse. While several soldiers and junior officers were ultimately tried for their involvement in the scandal, the most senior officers were either given reprimands or reassigned, escaping any criminal charges regarding their supervision of Iraqi prisoners. This entry provides an overview of the events that led up to the scandal, the participants, and the aftermath.

Background and Scandal

After the start of the Global War on Terrorism and the opening of prisons, such as the detainment center in Guantanamo Bay, Cuba, public debate began over the legality of holding detainees without the rights granted to combatants under international humanitarian law as expressed in the Geneva and Hague Conventions. Questions regarding the legality of U.S. detention centers—what qualified as legal interrogation measures and what constituted torture and war crimes—drove the debate, both in the

legal system and the media. Prior to the Abu Ghraib scandal, President George W. Bush had maintained that no ill treatment or torture was taking place under U.S. watch. In the case of Afghanistan, the Bush administration ruled that Taliban fighters were not lawful combatants and not entitled to protections accorded to prisoners of war under the Geneva Conventions.

In the case of Iraq, the Bush administration declared that individuals captured and detained would be granted the protections accorded to prisoners of war under international law. As a result, the International Red Cross had regular access to detainees held by U.S. and coalition forces in Iraq. In 2003 and early 2004, the Red Cross lodged complaints of abuse of those being held in Iraqi facilities by the American forces. In February 2004, the organization provided a confidential report to U.S. authorities that documented systematic abuse of prisoners, especially those thought to be of special value for interrogation on intelligence matters. It found that the abuse included physical violence, psychological abuse, and threats against family members, all illegal under international humanitarian law. In response to this concern, the U.S. Army set out to investigate the allegations and compile its own findings.

Specialist Joseph Darby was responsible for bringing the specific abuses at Abu Ghraib to the attention of military authorities in January 2004. He provided the army's Central Investigation Command with a computer diskette containing clear evidence of prison abuse. U.S. Central Command immediately launched an investigation, and both Secretary of Defense

Donald Rumsfeld and President Bush were informed of the parameters of this incident. The scandal became public in April when an unnamed Pentagon official leaked the images to CBS News.

On April 28, 2004, the CBS news magazine *60 Minutes II* ran a segment on U.S. prisoner abuse at the Abu Ghraib prison, featuring the now-famous photograph of a prisoner draped in a cloak, wires attached to his hands, as well as showing additional photographs depicting smiling, uniformed soldiers posing with naked prisoners. In an interview with Dan Rather, Brigadier General Mark Kimmitt acknowledged that the abuse was “reprehensible” but claimed it was the work of a few soldiers at the prison and should not be viewed as representative of the whole army. On April 30, 2004, the first of a series of articles by Seymour M. Hersh in the *New Yorker* was posted online, with more photographs and further details about the systematic abuse of prisoners. Hersh’s first article, “Torture at Abu Ghraib,” appeared in print on May 10, 2004, and in it and subsequent pieces, he described the torture used by U.S. forces during interrogation and documented involvement by senior military intelligence officers and military contractors. The series was later published in Hersh’s book *Chain of Command*.

In early May, the Pentagon released a comprehensive report by Major General Antonio Taguba, who in February of that year had been charged with investigating the abuse. In his report, Taguba found that the army had encouraged these brutal methods of interrogation among military police and that the use of such tactics was more widespread than previously acknowledged. Soldiers at Abu Ghraib had engaged in “systematic” physical and sexual abuse of inmates, even using dogs to attack the prisoners. The Taguba Report also acknowledged that Abu Ghraib held unidentified detainees who were hidden from Red Cross workers visiting the prison to determine whether Geneva Convention standards were being maintained.

Aftermath

After the Abu Ghraib scandal emerged, the Pentagon released numerous documents concerning internal discussions of interrogation practices. These documents revealed that the Justice Department,

the executive branch, and the Department of Defense were aware of many of these tactics and that the Department of Defense and Rumsfeld had approved them. One leaked Justice Department memo from Attorney General Alberto Gonzales revealed that harsh treatment was not considered torture unless it caused significant physical pain comparable with organ failure, impairment of bodily function, or death. In June 2004, the U.S. Supreme Court issued rulings on several cases related to detention and abuse, and though the Court did not disagree with the president’s right to detain prisoners, the justices noted that detainees had the right to counsel and the right to contest their charges.

The United States is a signatory to the 1949 Geneva Conventions and the 1984 UN Convention Against Torture, which define torture as a war crime wherein there is intentional infliction of severe mental or physical suffering to obtain a confession from, punish, or coerce an individual. Despite concern that the actions at Abu Ghraib constituted torture and war crimes, there were few legal repercussions for those involved. At the time, many called for Rumsfeld’s resignation (and he claimed to have offered it twice), but he stayed with the administration. Seven were charged with their involvement in the abuse, though none were ever formally charged with the deaths of detainees occurring under U.S. watch, including Lieutenant General Ricardo Sanchez who was later found to have approved the interrogation techniques.

The only criminal prosecutions pursued in connection with Abu Ghraib were of enlisted personnel. Seven soldiers faced court-martial, including Staff Sergeant Ivan Frederick, who posed in many of the abuse photographs, and Specialist Charles Graner and Private Lynndie England (who also posed in the photographs and was transferred before the scandal as she was pregnant with Graner’s child). Graner acted as one of the ringleaders of the abuse, and 173 photos of abuse were found on Graner’s camera. Frederick reported that military intelligence, including members of the Central Intelligence Agency and private government contractors, had encouraged the abuse. Brigadier General Janis Karpinski, the senior officer in charge of the prison, was suspended in January 2004 and reprimanded, but she was never charged with a crime, nor were any of her superiors.

Senate hearings on the scandal were started in 2004, but the proceedings were postponed until the U.S. Army could complete its courts-martial on the matter. Army officials such as Sanchez essentially claimed Abu Ghraib was an aberration and not part of a wider institutional pattern. At one hearing, Lieutenant General Paul Mikolashek presented his findings that the abuses were not representative of anyone in the army other than the individuals who directly participated in the abuses. While there was some backlash in the press, there was little follow-up, and the scandal gradually dissipated from the public eye. In early 2006, several of the alleged abusers accused of threatening prisoners with dogs went to trial. Colonel Thomas M. Pappas, the former intelligence chief at Abu Ghraib, testified against some defendants, including Sergeant Michael J. Smith, in exchange for immunity from prosecution.

In the Arab world, Abu Ghraib was a public relations disaster that undercut American credibility. While conducting its war in Iraq, the Bush administration had insisted that the United States remained committed to promoting democratization and the rule of law. The scandal undercut this position in the eyes of many in the region. In terms of gender politics in a region with strongly patriarchal societies, the abuse of male prisoners by a female soldier was perceived as especially degrading.

Conclusion

The question of whether U.S. actions at Abu Ghraib amounted to torture or war crimes was key in the investigation of the prison, though the scandal has largely disappeared from the public eye. At the time of the scandal, the executive branch was involved in a prominent public discussion on the legality of its detention policy, and it was reluctant to change course.

Documents released in the aftermath of the scandal revealed that as early as 2002 the administration and the Pentagon had been aware of torture in the U.S. interrogation policies; some claim that these very relaxed interrogation guidelines paved the way for these abuses. The Bush administration claimed that the Global War on Terrorism and its combatants did not qualify for protection under the Geneva Conventions, though the nation of Iraq is signatory to the Geneva Conventions and its citizens and combatants were legally protected by its standards.

Some scholars suggest that the “us” versus “them” mentality displayed after 9/11 and in support of the Global War on Terrorism was largely responsible for the abuses and that the approval of “enhanced interrogation techniques” for Guantanamo detainees encouraged their spread to Iraq and Abu Ghraib. Whatever the case, the military police at Abu Ghraib were involved in a number of war crimes, enabled by a chain of command that approved of their conduct. The Abu Ghraib scandal bears witness not only to the results of officers neglecting their leadership expectations but also to the necessity of proper adherence to international humanitarian law.

ABUSE, FAMILY AND CHILD

Research indicates that domestic violence suffered within military families is greater than that in the civilian community. The lack of uniformity in command's response to domestic violence incidents often creates obstacles to appropriate treatment and intervention. The Uniform Code of Military Justice (UCMJ) offers guidance regarding remedies and punishment. However, domestic violence is not clearly defined or coded in the UCMJ.

Depending on the severity of the case, a soldier may be charged with assault, battery, or rape. In most cases, domestic violence offenses are addressed by non-court-martial proceedings. Punishment or sanctions can range from written reprimands to loss in liberty, loss in pay, and/or loss in rank. A military protective order may also be issued. This entry examines domestic violence in military families, including its link with posttraumatic stress disorder (PTSD), the phases and patterns of family violence, and investigation procedures and sanctions.

Background

Department of Veterans Affairs (VA) research indicates that male veterans with PTSD are 2 to 3 times more likely to engage in intimate partner abuse and become involved in the legal system than non-PTSD veterans. A Yale University study concludes that men who serve time in combat are 4.4 times as likely as other men to engage in domestic violence. In addition, they are 6.4 times more likely to suffer from PTSD and 2 to 3 times more likely to suffer from depression, substance abuse, unemployment, divorce, and separation.

A Yale study that appeared in the *American Journal of Public Health* states that even those veterans not diagnosed with PTSD often suffer unemployment and substance abuse. This reaffirms the challenges associated with addressing the needs of veterans returning from combat.

Frank Schoenfeld, director of the Post-Traumatic Stress Disorder Clinic at the VA Medical Center in San Francisco, comments, "Whether or not they develop post-traumatic stress disorder symptoms, combat vets frequently suffer from a lower tolerance for frustration, explosive outbursts and never-ending alertness" (quoted in Dotinga, n.d.).

Veteran population demographics are changing. World War II veterans are reaching their 80s and 90s as young veterans complete tours of duty in Iraq and Afghanistan. The number of living veterans who have served in the U.S. military is staggering.

Interpersonal Violence: Military Significance

Studies have found that, in addition to more general relationship problems, families of veterans with PTSD have more family violence, more physical and verbal aggression, and more instances of violence against a partner. In these studies, female partners of

veterans with PTSD also self-reported higher rates of perpetrating family violence than did the partners of veterans without PTSD. In fact, these female partners of veterans with PTSD reported perpetrating more acts of family violence during the previous year than did their partners—veterans with PTSD.

Similarly, Byrne and Riggs found that 42% of the 50 Vietnam veterans in their study had engaged in at least one act of violence against their partner during the preceding year, and 92% had committed at least one act of verbal aggression in the preceding year. The severity of the veteran's PTSD symptoms was directly related to the severity of relationship problems and physical and verbal aggression against the partner.

Domestic violence and child abuse in military families can arise at every level of command or rank; no one is immune to the consequences. While many offenders are men, women are also capable of committing acts of domestic violence and child abuse. Occasionally, a synergistic and pathological relationship unfolds, which involves both parties meeting violent psychological needs.

Approximately 3 million service members are currently serving in the armed forces. Increasing rates of deployment, long family separations, and multiple redeployments increase the likelihood of domestic conflict and strife. Thousands serving in Afghanistan and Iraq under considerable stress and trauma face considerable challenges of increased stress and unsatisfactory family reentry adjustment when they return.

Definitions

Spousal Abuse

Military spousal abuse includes (a) assault, (b) battery, (c) threat to injure or kill, (d) acts of force or violence, (e) emotional maltreatment inflicted on a partner in a lawful marriage, and (f) a spouse under the age of 18 years of age falling into this category.

Child Abuse/Neglect

Department of Defense definitions include physical injury, sexual maltreatment, emotional maltreatment, and deprivation of necessities, or combinations of these behaviors by an individual responsible for the child's welfare. The circumstances must indicate that harm or the threat of harm is imminent to the

child's welfare. The term *child* refers to a natural child, adopted child, stepchild, foster child, or ward.

Child Abuse–Neglect Connection

Military police investigators who take domestic abuse and violence calls understand the child abuse–neglect connection. The sad little faces tell it all; their victimization and psychological trauma appear obvious to first responders. Children living in these homes represent part of the cycle of abuse. Unfortunately, children often become pawns on a family chessboard of players, their designated role—to checkmate family members. Their innocent presence offers the potential for maltreatment, deprivation, victimization, and potential sexual exploitation.

Obstacles to Breaking the Cycle of Violence

Military commanders, officers, and noncommissioned officers find domestic violence disturbing. The child abuse and neglect cases are intense and require extremely difficult decision making. Related personnel domestic abuse and violence issues take considerable time and effort away from the military's traditional warfighting mission.

Moreover, military police personnel who become involved dread the violent scenes they witness. Responders understand that victims of domestic violence often do not cooperate with the authorities because of concern for their spouse's military career. This is especially the case when dependent children are a major consideration.

Patterns of abuse, battering, and violence emerge in pathological cycles. The cycle repeats itself primarily because of denial on the part of commanders, officers, sergeants, and victims. The objective of effective intervention requires breaking through the mask of denial and the related rationalizations.

Military police personnel and sergeants who serve as first-line supervisors are the most likely military personnel to encounter domestic violence. Breaking the cycle of domestic violence requires identifying and learning the red flags of domestic violence. Domestic violence generally emerges in three phases: (1) tension building, (2) acute explosion, and (3) honeymoon. Primary issues for the abuser or domestic violence offender include power and control.

In the tension-building phase, the victim will retreat into denial, rationalize events, and recant on

earlier statements. In many cases, these behaviors produce reluctance to assist and encourage denial in those who respond to complaints. At this stage of development, the red flags include isolation of the victim, withdrawal of affection, and picking on small things. As the tension rises, the abuser becomes sullen, hypercritical, and prone to screaming and threatening. The abuser may destroy property or personal items.

In the acute explosion, the red flags include spitting, shoving, blocking and slamming doors, grabbing, and blocking escape routes. Choking or striking the victim and violence escalation are possible. During the acute phase, military authorities and military police personnel are likely to react to the violence and evaluate life-threatening behaviors. Missing these red flags in this phase may turn a domestic abuse and violence call into a homicide investigation.

In the honeymoon phase, red flag behaviors include the abuser expressing remorse; however, the apology may serve as a ruse and not be sincere. The offenders seek to reposition their place in the tension-building phase and find temporary relief from the attention of military authorities. The temporary reconciliation can be frustrating to commanders and military police personnel. Reconciliation encourages denial and may prevent an appropriate military response, intervention, and further effective solution.

Closing a military domestic violence case is a difficult decision. The danger that abusive behaviors may reemerge often persists for years. Moreover, the military offender may transfer to another command or switch targets when entering a new relationship. The novelty of the relationship may distract the abusive partner in the short term; however, a return to targeting the former or separated spouse is always possible. A domestic violence/stalking pattern may emerge after incarceration, commitment, or even a lengthy prison term.

Investigation Procedures

The military has two separate tracks to address domestic abuse and violence. One track is the military chain of command and military justice system. The other track is social assistance and family assistance. These pathways are separate and distinctly different in purpose and goals.

The social service assistance track is titled the Family Advocacy Program (FAP). This program

is not punishment oriented; it seeks to protect the victim and rehabilitate the offender. FAP program goals include (a) identification, (b) intervention, and (c) treatment programming.

For example, the military system determines if the case is unsubstantiated, suspected, or substantiated. In contrast to military justice, FAP might find that a case merits substantiated abuse. However, there is insufficient legally admissible evidence to allow punishment under the UCMJ and military justice system. The military and FAP might arrive at different conclusions after reviewing the facts related to the same case.

The FAP social worker will investigate the domestic abuse incident and assess the victim's safety and planning procedures. During this preliminary process, the victim's immediate medical needs take priority. Mental health issues and protection response needs are also of primary concern. At this point, the FAP social worker may request a military protection order issued by the commander.

Social investigations include interviewing alleged offenders and informing them of their rights under Article 31 of the UCMJ. The decision must include the protection of the children. When child abuse or neglect is involved, military regulations require that child protection agencies be contacted and that they conduct an independent investigation.

The military justice system may involve a commander's Article 15 punishment or military Article 31 investigation, and court-martial under the UCMJ. U.S. Army Criminal Investigation Command (USACIDC) may become part of the investigation in felony-related crimes or homicide.

A Responsibility to Intervene

Domestic abuse and violence affect morale and unit readiness. Proactive preventive measures that offer positive intervention require command emphasis. Military commanders and leaders need to address family abuse/violence interventions. Absent and maladjusted military personnel influence mobilization and mission requirements. Military personnel who are obsessed with family issues cannot perform their duties effectively and present a risk to themselves and others who serve within the U.S. military. This is especially a concern in military combat zones. Proactive assessment means meeting the needs of the military families and service members,

because serving their needs ultimately serves the nation well.

ACCOMMODATIONS, FIELD

Field accommodations provide members of the military the basic living necessities under temporary conditions in a field environment. Field accommodations supply the using military unit the capability to live and operate in an austere environment away from established bases and permanent stations.

These temporary facilities are designed to be easily transported and erected and to be made operationally capable quickly, then to be repackaged and moved as the mission and combat situation dictate. Field accommodations can vary based on the size of the unit, the threat environment, the duration of the operation in which the unit is participating, and military service. Additionally, as technology changes, the equipment in field accommodations changes, but the basic elements and requirements have remained the same throughout the modern military era. This entry provides details on the elements of field accommodations: shelter, food services, and hygiene services.

Field Accommodations Based on Environment

Field accommodations can vary greatly by the environment in which the operation is taking place, and those conditions will have a massive impact on the quality and availability of field accommodations. In hostile, forward combat areas, the field accommodations are very austere, relying primarily on what each service member can carry. Logistical limitations due to great enemy threats prevent the movement of large or supply-intensive equipment directly to the forward line of troops. This results in the creation of forward operating bases or logistical support areas, which are large cantonment camps designed to house supplies, maintenance facilities, and other logistical requirements in a centralized location near the combat troops but far enough away to avoid significant threats. Many of these logistical areas are created around runways, making the airfield/logistical area a massive field base. This is a common situation in Operation Enduring Freedom, where bases are built around airfields and house large logistical facilities. This was also common during Operation Iraqi Freedom. As the threat environment improves, many forward troops build combat outposts that provide them with a small living area that consists of basic accommodations. Combat outposts can vary greatly by their location, which affects logistical resupply and equipment availability options. Many combat outposts in Operation Enduring Freedom have billeting tents, a command and control or headquarters tent, and a field kitchen. Some are able to set up hygiene services, although the amount of water required to run the equipment is often a factor. In prolonged conflicts at major bases, such as

the case of Operation Enduring Freedom and, earlier, Operation Iraqi Freedom, many field accommodations services are contracted. For example, the hygiene, food service, and billeting requirements aboard Al Asad, a massive base in the Al Anbar province of Iraq, were provided predominantly by a company called KBR. All services were provided by civilians and civilian companies contracted by the Department of Defense.

Elements of Field Accommodations

The key components to field accommodations include those basic elements that satisfy standard military needs, such as shelter, food and food preparation equipment, hygiene services, and fundamental equipment to facilitate morale and troop welfare. Field accommodations imply that the equipment and facilities are temporary in nature and used in an environment where the site must be self-sufficient (limited or no host nation support available). Field accommodations are used in training evolutions in the United States and overseas away from primary, permanent bases, and they are used during actual military operations, including operations in armed conflict, humanitarian operations, and peacekeeping operations. While each service may use a different manufacturer and size of style of equipment, based primarily on mission requirements and field testing results by its service members, the elements of field accommodations are standard throughout the military; that is, each service will have shelter and food and hygiene equipment, although they may not be the same color or produced by the same company.

Shelter

Depending on the type of military operation being conducted and the threat environment of the area in which the unit is operating, the type of shelter required may vary from a single, one-person sleeping system to a massive, 1,300-pound tent facility. In each case, the requirement is basic protection from the elements.

Each service member is issued a sleeping system, a combination of three sleeping bags and a carry sack, that provides warmth and waterproof protection from the elements. The system is designed to be easily compacted and carried in a backpack, providing each person with a rudimentary, very lightweight shelter. The sleeping system can be used by

light infantrymen on patrol in enemy territory when constant maneuver is required. The system is also designed to be used in lower threat environments on static temporary bases as bedding on cots. The sleeping system has evolved since the end of the Cold War, focusing on reducing the weight of the equipment and improving its effectiveness. Sleeping bags have been issued to service members since World War II. The first such bags were mummy-style, single polyester bags that served the basic infantry soldier. As technology improved, the sleeping system came to include a combination of bags made from synthetic material whose outer layer is made from waterproof Goretex material. The four-part Modular Sleep System sleeping bags and other components are constructed to be used in conjunction with each other or separately to complete an interoperable system known as the extreme cold weather sleeping bag. The sleeping system provides warmth to the user in temperatures ranging from 50° to -30° F, provided the user is wearing base layer cold weather clothing. The first component of the sleeping system is the green patrol bag, suitable for temperatures down to +30° F. The bag has a reversible double pull slider, allowing ventilation at the head or feet, a nonlocking slide fastener to prevent snags, and a draft flap to prevent heat loss. The hood adjusts for heat retention as well. The black intermediate bag is the second piece of the system, suitable for temperatures down to -10° F. The insulation is twice as thick at the feet area to provide additional warmth. The chest collar prevents drafts up and down the hood of the bag, which adjusts for heat retention like the patrol bag. The outer layer of the sleeping system is a camouflage bivy cover, which waterproofs the system with an impermeable Goretex material but allows vapor to escape. The bag is sealed by a zipper slide or a snap fastener system. Finally, the bags can be placed into a water-resistant black stuff sack, which can compress the sleeping system to 1 cubic foot by using six 1-inch-wide nylon webbing straps. The sack is closed by a nylon draw-cord closure with a barrel lock. The compact, lightweight system can be easily transported in a backpack, providing each service member with personal shelter.

Like the sleeping bag, tents have routinely been used since World War II, especially as sleeping quarters, office space, and storage. The original general-purpose (GP) canvas tent, used in World War II and changed little until the first decade of the 21st

century, provides the user a 16-foot × 32-foot tent with two entrances at each end. The tent is essentially a canvas skin supported by 15 wooden poles ranging from the 10-foot center beam to the 6-foot side poles. The tent walls can roll up to allow air to flow through, and the tent comes with two stovepipe shields to support a standard, 4-inch heater pipe. The tent offers cover but no flooring. This basic tent can be used as a billeting tent, fitting roughly 16 troops with cots and their equipment, as a headquarters tent, and as a storage tent for supplies. The GP tent was used extensively in Operations Desert Shield and Desert Storm in the coalition desert base camps, and although they are nearly phased out of the current inventory, they are still seen on major U.S. training bases for routine field exercises.

The GP tent has been replaced by the modular general-purpose tent system (MGPTS), a pole-supported, modular military tent that provides users with a multipurpose weatherproof shelter for any environment. The tent skin is made from a lightweight, waterproof vinyl-coated polyester fabric supported by a metal skeleton support system. The MGPTS medium-sized tent measures 18 feet × 18 feet and can be extended by adding 18-foot intermediate sections. The tent features four windows on each sidewall and two screened doors at each end. A fluorescent tube lighting system is incorporated within the tent, allowing it to be plugged into a power source to provide adequate lighting. The MGPTS can easily be set up in less than 45 minutes by four people and provides more than 300 square feet of floor space. The tent may serve as billeting, headquarters, and supply service shelters. These tents are often used during humanitarian aid missions by the military as emergency and disaster relief shelters.

The Drash XB series military dome tent is another style of medium to large shelter used by the military mainly as command and control, life support, medical, or surge facilities. The Drash tents can be set up and torn down within 30 minutes using six people because they require no assembly in the field. Both the Drash and the MGPTS come with a small attachable tarp that serves as basic flooring.

Military units may also utilize a shelter for the maintenance facility within the field base camp. A common version is the lightweight maintenance expandable tent (24 feet × 32 feet) with a modular design that can be extended in 16-foot increments.

The lightweight design is made possible by a collapsible aluminum frame that maintains structural integrity in adverse weather conditions. The lightweight maintenance tent provides rapid deployment and forward maintenance elements without sacrificing mobility, as it weighs only 1,332 pounds. The maintenance tent is designed to provide shelter for both track and wheeled vehicles in all climates.

For billeting purposes, the military provides its service members with small, portable two-man sleeping tents. The basic form of these tents has evolved from the basic shelter-half, a tent designed for each service member to carry one half of the canvas, poles, and stakes. The two halves are combined to create a triangle-shaped shelter, olive drab in color, whose durable canvas provides protection from the elements. These shelter-half tents do not provide floor panels. The military replaced the shelter-half system with a small collapsible nylon tent. The two-man tent style can vary by service, but the system is basically a 40-inch × 72-inch ripstop nylon, free-standing tent with two openings erected by a collapsible pole system. The water-resistant flooring combined with an impermeable rain fly make the tent waterproof, and it is ideal for use in temperatures ranging from 0° F to 120° F and can withstand winds with a speed of 40 miles per hour. With the rain fly attached, the tents can provide more than 35 square feet of cover for the individuals and their equipment.

Food Service

Food service in field accommodations comes basically in two forms: (1) individual meals and (2) ready-to-eat (MREs) or in-tray rations designed to feed a group of service members. The MRE comes in a sealed plastic bag that contains an entire vacuum-sealed, precooked meal and a number of supplements and accessories. Originally consisting of only 12 menus, the MREs have expanded to more than 24 options that include ethnic and vegetarian options. Each MRE provides a main course (typically 8 ounces); crackers or bread; a form of spread, such as cheese, peanut butter, or jelly; a beverage powder; and a type of dessert, such as poundcake or cookies. MREs also contain an accessory packet containing coffee or tea, creamer, sugar, salt, matches, a plastic spoon, and toilet paper. A chemical flameless ration heater is packed with every meal, which requires only water to activate it. MREs

provide approximately 1,200 calories per meal and nearly all the required vitamins and minerals. MREs have a shelf life of 3 years, weigh less than 2 pounds, and can be easily transported, making them an ideal food option for austere conditions.

In larger cantonment sites, the military unit may use a tray ration system, which requires only that the vacuum packaged trays of food be heated. One tray ration heating system is designed to feed 500 troops per day by heating 18 tray packs of food at a time in the tray ration heater. The heater boils 15 gallons of water around the tray packs, heating the contents. The tray packs only need to be removed, opened, and then the food served. The tray ration system can be used in all climates, from -65° to 125° F. The heater system is constructed of heavy stainless steel, has no open flame, and uses diesel fuel. The tray packs contain both a main meal and side dishes, which are also heated. The meal system also comes with cans of fruits and vegetables, desserts, and accessories. The tray ration heating system is designed to be mobile and easy to use, providing a hot meal option to service members in a field environment.

The mobile kitchen, or containerized kitchen, is another field food service system, which is a 20-foot expandable, dual-chassis trailer that becomes a true food preparation and cooking area. The system provides onboard power, water, ventilation, and environmental control and includes convection ovens, tray ration heaters, sinks and dishwashing area, food preparation tables, and utensil storage racks.

Hygiene

Depending on the threat environment and the size of the field base camp, a military unit may provide field hygiene services to its members in the form of a tactical shower unit and laundry system. The shower unit was created to provide hot water showers in the field, utilizing a water heater, pump, and shower stalls. The system requires electricity for the pumps, diesel fuel for the water heater, and water storage tanks, making the logistical demand somewhat high. The system can be set up in only a few hours by trained personnel, and it allows for a platoon-sized unit to shower in less than 30 minutes. The system is typically set up linearly, with a GP tent at the entrance used for a changing tent, the shower system in the middle, and the pump, heater, and hoses at the back of the unit.

The tactical laundry system operates in much the same fashion as a standard washer and dryer in one's home. The system utilizes a trailer-mounted washer and dryer, which operate electrically and can wash up to 800 loads of laundry per day, using only 500 gallons of water. The system is designed for a service member to drop off the laundry and receive it the next day, a process referred to as dry-to-dry.

ADVERTISING, MILITARY-SPONSORED

Over the past 40 years, the U.S. military has increasingly become focused on advertising, branding, and imaging. With the help of high-powered advertising agencies, it currently spends hundreds of millions of dollars each year creating stunning marketing campaigns. These campaigns rival, and in some cases exceed, the efforts of many *Fortune* 500 companies. The military hires top-tier advertising agencies such as McCann-Erikson (army), Campbell-Ewald (navy), GSD & M (air force), and J. Walter Thompson (Marine Corps). These agencies also serve clients like McDonald's, Ford, Southwest Airlines, BMW, Disney, and Coca-Cola, to name a few. They help the military conduct market research and develop adver-

tising campaigns to reach potential recruits. These advertising campaigns make use of all available media, including television, radio, print, the Internet, video games, and sponsorships. This entry examines the history and types of U.S. military-sponsored advertising and details advertising campaigns of the army, navy, air force, and marines.

The military has had a long-standing relationship with advertising agencies; however, prior to the 1970s, advertising efforts were minimal. It was the military's transition to the modern all-volunteer force (AVF) that set the course for transition to full-blown adoption of commercial marketing and advertising. To achieve the goal of an AVF requires the use of monetary incentives, recruiters, and advertising. Military-sponsored advertising campaigns are designed to increase awareness of incentives, encourage potential recruits to seek more information, and increase receptivity to interactions with recruiters.

Among the service branches, the U.S. Army has been the leader in adopting, implementing, and even innovating advertising practices. This de facto leadership role is the result of the army's significant manpower requirements. Their advertising budget runs into hundreds of millions of dollars and is usually several times larger than the other service branches.

Pursuing Paid Advertising

Starting in the late 1960s, recognizing that the transition to the AVF was inevitable, Army Chief of Staff General William Westmoreland took the initiative and commissioned the Project PROVIDE study to understand how the army could embrace the transition to the AVF. Among the findings, the report specifically addressed how the army needed to cultivate its public image and embrace the use of broadcast media. At the writing of the report in 1969, the army's advertising budget stood at approximately \$3 million annually, with restrictions against purchasing commercial television and radio time. While broadcast outlets offered free airtime for army commercials as part of their public service obligation, these were not prime-time slots and did not hit the target audience. In all, the report specifically called for increasing the advertising budget to \$36 million and securing approval to pay for broadcast media advertising.

In 1971, the army requested, but did not receive, additional funding in the budget for paid media advertising. However, Congress granted the army

permission to reallocate other money and conduct a limited, 13-week paid broadcast media test. The use of broadcast media and the purchase of prime-time advertising slots allowed for greater control and saturation of the target audience. The results of the test showed that paid broadcast advertising increased awareness, motivated some to action, and led to increased enlistments. Furthermore, the test showed that broadcast advertising had residual effects as enlistments remained high for several months following the campaign. Unfortunately for the army, while the results of the test were successful, Congress was not so supportive. Congressional critics, such as F. Edward Hebert (D-LA), chairman of the House Armed Services Committee, were in opposition to government paid advertising. Hebert felt that it was the patriotic duty of broadcasters to give priority to military advertising and that if they did not do so, they should be threatened with Federal Communications Commission violations. This ban on broadcast advertising remained until Hebert's end as chairman in 1976.

Of particular interest is how the army went about creating the advertising campaigns. The army turned to social science to better understand what would attract recruits. Two themes emerged from this study, freedom and individualism, both the result of a generation scarred by the Vietnam War and steeped in consumerism. The army took this social science insight and worked with its advertising agency N. W. Ayer to modify the army's image to meet this new generation. The result of their work was the "Today's Army Wants to Join You" campaign. The message, a play on the Uncle Sam's poster stating "I Want You," attempted to convey that the army was not demanding service from a recruit but seeking to offer the recruit a partnership. Gone were appeals of patriotism and service to country. As might be expected, the army's generals were not impressed, but the Ayer group convinced them that they were not the target market and young people would respond to it, thus ceding creative control to the advertising agency. Since the use of broadcast media was prohibited, "Today's Army Wants to Join You" proceeded in print and radio only. These ads reflected what young men, and eventually women, coming of age in the mid-1970s wanted. For example, the tag line of one advertisement was the following: "We care more about how you think, than how you cut your hair." This represented acquiescence to

individual and personal freedom. Another ad featured the tag line "When was the last time you got promoted?" This ad was interchanged with four different photos: a White male, a White female, a Black male, and a Black female. Because critics of the AVF were quick to criticize the potential for an army consisting solely of minorities, the interchange was a deliberate attempt to avoid direct racial appeals to any specific market segment. Similarly, the ad with the tag line "If you think you'll miss the guys bring them along" depicts four White males and one African American male, in an effort both to ensure mass appeal and to place the subtle message that the army is racially inclusive. Future video ads copied this trend and eventually incorporated women in the same way.

Building Marketing Brands

Essentially, the army was creating its marketing brand. A brand is the definition of what an entity is, what it stands for, and how it conducts itself. It is these elements that differentiate it from the competition and attract customers. Most major businesses spend significant time and money to establish, cultivate, and sustain their brands. In the case of military advertising, the potential recruit is the consumer, and the other service branches are the competition. Thus, each service branch started to develop a brand that effectively sold the benefits of serving in that branch. Therefore, being able to associate a set of key traits and messages with a brand helped make the broadcast advertising more effective.

Army

As noted above, the U.S. Army sought to push past the tarnished Vietnam legacy and create a brand that represented service as leading to mutual benefits. Continuing to work with N. W. Ayer, it created the "Be All You Can Be" advertising campaign in 1981. The campaign was so successful that it was rated, by the industry advertising magazine *Ad Age*, number 18 in the list of the top 100 advertising campaigns of all time. The message was so popular and successful that it remained in use through 1999. The army continued to expand its brand throughout the 1990s to include the themes of character building and service to country. At the start of the new millennium, the army brought in a new ad agency, Leo Burnett, that created the "Army

"Army Strong" logo.

of One" campaign. The concept was based on real soldiers talking about their jobs in their own words. Thematically, the ads conveyed character building, discipline, and self-esteem by implying the opportunity to be transformed by mental, physical, and emotional challenges. The army took advertising to new heights with its new agency McCann Erickson and the 2006 "Army Strong" campaign, which used Samuel Bayer, a prolific and accomplished video director, to direct the video. Mark Isham, an Emmy award-winning composer, was commissioned to write the score.

Navy

Historically, the U.S. Navy has always had a challenge in recruiting people to serve from the interior of the United States. How do you entice someone to go to sea when they have grown up landlocked their entire life? To address this challenge, the navy has focused its branding on the benefits of service, educational opportunities, teamwork, and travel. As such, the advertising campaigns have followed suit. For example, the navy's 1976 campaign "It's Not Just a Job It's an Adventure," created by Bates Advertising, attempted to speak to the type of adventures one could experience by serving in the navy. The navy's next ad success was "You Are Tomorrow; You Are the Navy" and "You and the Navy, Full Speed Ahead," created by BBDO Worldwide in 1988 and 1990, respectively. The Campbell-Ewald ad agency created the "Accelerate Your Life" campaign in 2001. In all of these cases, the message of individual benefits and "you" resonated clearly. By contrast, the navy's 2009 "America's Navy. A Global Force for Good" focuses on the navy's impact on

history in terms of both warfighting and providing humanitarian support. Research suggests that the generation coming of age in the early 21st century is interested in making a difference beyond themselves. This ad campaign is targeted at those desires, a stark change from the "you" so prominent in the earlier campaigns.

Air Force

The U.S. Air Force has had a reputation for being at the forefront of cutting-edge technology. The pursuit of everything from jets to satellites to nuclear missiles and bombers has established and reinforced the air force brand. Consequently, the air force has been the destination for recruits who want to be trained in and work with cutting-edge technology. This resulted in an abundance of qualified recruits with limited recruiting efforts. Amazingly, the air force did not pay for television broadcast media until the late 1990s, when recruiting numbers dropped. Up until that point, they relied solely on public service announcements. The air force's signature advertising campaign was "Aim High," released in 1984. This ad promoted themes of improvement, achievement, and technological sophistication. The campaign held the highest recognition value, second only to the army's "Be All You Can Be," all the way until 2000. Unfortunately for the air force, the subsequent campaigns "Cross Into the Blue," "No One Comes Close," and "Do Something Amazing" have struggled to attract the same level of success. "Do Something Amazing" was particularly criticized because many thought that it was not specific enough to the air force brand and could have applied to any of the service branches. The air force replaced this ad in 2008 with "Above All," which is a double entendre, suggesting physically above others with air, space, and cyberspace technology as well as figuratively standing out above the other service branches. After a range of new slogans were considered, "Aim High" in 2010 returned as "Aim High, Fly-Fight-Win."

Marines

The Marine Corps has a long history of marketing its brand, born out of a desire to retain its autonomy. The Marine Corps brand has consistently promoted toughness, courage, and belonging to an elite organization. This was well represented in the marketing

slogan “A Few Good Men,” which dates back to the 1700s. However, with the AVF and a greater integration of women into the services, the marines had to expand their message to be more inclusive. Its ad agency J. Walter Thompson came up with “The Few, the Proud, the Marines.” This message highlights the exclusivity of the service, suggesting that being a marine is not for everyone, only those who seek to achieve greatness. This theme remains in use in modern marine marketing advertising. During the 1980s, the Marine Corps produced a memorable broadcast marketing campaign based around the themes of rite of passage and transformation. These video spots, complete with high computer-generated imagery effects, showed individuals being thrust into challenging situations and forced to conquer obstacles and fight dragons. On successfully completing the challenge, the individual transforms into a marine. Naturally, these ads were a metaphor for the transformation one would achieve by serving in the Marine Corps. When watched, these videos played as part video game, part movie, and part music video. To some degree, they came to represent the excessive end of service marketing advertising. *The Simpsons* television show cemented them into popular culture by creating a parody commercial in Episode 5, Season 18.

By contrast, the marines have recently opted for a more toned-down approach to their advertising. The 2008 ad “America’s Marines” featured the marines’ Silent Drill Platoon performing its routine at famous landmarks across the United States. This ad received positive feedback for showing a softer side and having a broader appeal. In conjunction with this campaign, in 2008 the marines for the first time started advertising directly to women. They ran ads in magazines and television shows that appealed to women. These ads focused more on patriotism than personal heroism and achievement. However, in 2009, the marines shifted back to a rougher, tougher, and grittier image with “America’s Marines.” This ad showed marine recruits being challenged with obstacle courses, crawling through mud, and being teargassed (including vomiting). The recruits are shown making this journey and on successful overcoming of these obstacles, they are transformed into marines—very similar to the 1980s commercials. In 2012, a new advertising campaign, “Toward the Sounds of Chaos,” highlighted the marines’ work providing humanitarian relief and

conducting peacekeeping operations under difficult and dangerous circumstances.

“Free” Advertising

While the service branches worked to navigate congressional funding for paid broadcast advertising, the Department of Defense (DOD) has had access to the ultimate advertising tool at its disposal for decades: Hollywood films. Hollywood film producers can receive in-kind use of billions of dollars of military equipment (e.g., tanks, planes, helicopters, nuclear submarines, aircraft carriers) and locations from the military for nominal cost. In return, the DOD retains creative control of the script to ensure support for recruiting and retention efforts by portraying the military in a positive way. Movies such as *Top Gun* (1986) not only show military service in a positive light, but they also enhance or glamorize it. There are no specific studies that quantify the effect movies have on recruiting, but plenty of anecdotal evidence exists to suggest that movies help recruiting efforts, and for the DOD it is essentially paid advertising without the cost. While all the branches have been represented by and make use of this medium, the one most pointed to as success was the navy’s role in *Top Gun*. Sensing the potential public relations impact of the movie, the navy coordinated recruiters at some of the movie showings to help boost enlistments. As one might expect, the navy saw a huge spike in naval aviator recruits after the movie came out.

Movies like *Top Gun* and, more recently, *Behind Enemy Lines* (2001), *Black Hawk Down* (2001), and even the sci-fi *Transformers* (2007) play to audiences as gigantic recruiting posters. The characters and scenes in these movies, and others like them, grab the audience and do not let go. Replete with millions of dollars in special effects, stunning music, and top-notch acting talent, these movies inspire, excite, and capture the imagination. Scenes like a Black Hawk helicopter being shot down and American soldiers bravely fighting wave after wave of Somali attackers, Owen Wilson traversing across Bosnia using only his training to outrun the militia pursuing him, or Tom Cruise and Val Kilmer, outnumbered and at a technical disadvantage in their F-14 Tomcats, successfully fighting off a bevy of enemy MiG fighters while a Joe Satriani guitar anthem blasts in the background—these scenes are

no coincidence. The end result provides the DOD with a low-cost way to drive high-value positive messaging of the military.

Research

Once the DOD and service branches started paying for broadcast advertising, they had to answer the question “Was it making a difference?” As with private sector businesses, quantifying advertising effectiveness is a difficult proposition. It is nearly impossible to identify the return on investment of advertising expenses, especially with broadcast media, where there is no metric as to how many people saw or heard the advertisement and whether or not they took action. Nevertheless, the DOD engaged the RAND Corporation to produce a study in 1989 that measured the effects of advertising testing. Their analysis found that advertising programs were good at increasing the number of potential enlistments and that national broadcasting produced significant results versus local radio spots. Interestingly, the authors determined that a concentrated short-term increase in advertising expenditures not only increased short-term enlistments, but it also created a residual effect over the following months. Furthermore, they noted that timing was important when deciding when to pay for advertising. Also, they found that recruiting was affected by the economy such that when it was bad, enlistments went up, with little need for advertising. Yet when the economy was good, enlistments declined, creating a good opportunity to make advertising purchases. This suggested that modulating when and how the advertisements were broadcast prevented oversaturation and dilution of the message. Also, the study demonstrated that combining media types could complement each other. For example, broadcast media evoked an emotional response, which could garner a potential recruit’s interest. By comparison, print media provided a cognitive experience, allowing the potential recruit to absorb the details of the message and offer. In this way, as it does for businesses, advertising provides a way to generate potential leads. Broadcast media also generate wide-scale impressions, the number of times people are exposed to a marketing message. Researchers concluded that infrequently purchased products, in this case enlisting in the military, required a longer sales cycle. Longer sales cycles required generating

and sustaining impressions for a much greater time frame. Broadcast media, and more recently Internet and social media campaigns, gave military advertising the requisite boost.

The Internet and New Media

As the Internet and social media have come on the scene, the DOD has taken advantage of these mediums. The Internet has the unique ability to simultaneously present an emotional and cognitive experience, combining the benefits of broadcast and print media. Also, Internet technology provides interactive, two-way, and quantifiable experiences. Historically, advertising campaigns used broadcast media to garner the attention of potential recruits, print campaigns provided detailed information, and the recruiter signed the recruit up. Now that entire process is streamlined. The individual service branch websites offer emotionally stimulating videos, and on the same page, they provide links to all the information a potential recruit might desire. The ability to chat live with recruiters directly is simply a click away, all within the same user experience. Furthermore, this technology is extremely cost-effective because once it is built, the ongoing costs are minimal.

Military advertising has also kept up with the development of social media. Social networking sites such as Facebook, Twitter, and Myspace (before its demise) provide an opportunity for potential recruits to connect with other people of like-minded interests without time and geographic limitations. From a cost perspective, social networking sites are free, so there is no monetary investment for recruiters to participate on these sites. Each of the service branches has a strong presence on these sites, and that effort has grown and adapted with the technology. The ability to make large-scale social connections with communities of people who share a common interest is quite helpful to each of the service branches. Through these sites, recruiters can facilitate meaningful interactions with potential recruits on a massive scale. Furthermore, these sites blur the lines between advertising and recruiting, which could change how advertising money is spent. However, social networking sites are not without their downside. Just as those who share similar interests in the military can easily congregate, it is easy for critics to form and create negative attention.

The army has a proven track record of advertising leadership and willingness to adopt new methods, as evidenced by its initial push into paid advertising in the early 1970s. The army took a similar initiative in 2002, pushing the online interactive experience further by developing the video game America's Army (AA). AA is a first-person shooter, massively multiplayer online role-playing game. First-person shooter games consist of on-screen views that mimic that of the character, and massively multiplayer online role-playing games allow for hundreds or thousands of players to play together simultaneously online. AA provides users with a realistic virtual experience of the army. AA is one of the most popular first-person shooter games in the video game industry. As of this writing, there are more than 10 million registered users of AA. The game's popularity has spawned versions that can be played on gaming consoles and cell phones, and there is even an arcade version. These games can be played in single and multiplayer modes simultaneously linked with users from all over the world. More important, for recruiting purposes, army recruiters can play the game and can build relationships with potential recruits.

Taking this concept further, the army has a 19,500-square foot mobile inflatable exhibition dome that houses the Virtual Army Experience (VAE). The VAE allows 40 players to become army soldiers for 20 minutes by participating in a virtual reality experience through Humvee and weapons simulators. The VAE travels around to various NASCAR and air show events, as well as to popular spring break destinations. Similarly, the air force has a mobile marketing tour called Command Center Alpha (CCA). The CCA provides an arcade-like environment where users can participate in various 3D experiences, videos, and games. The CCA travels around to sporting events, air shows, and festivals where potential recruits are to be found.

Conclusion

Paid military advertising has come a long way in a short time. The service branches and their advertising agencies have developed, refined, and implemented sophisticated advertising and branding efforts. The DOD has expended great effort and money to research the effect of recruiting and further

refine how money is spent. More impressive is the way in which military advertising efforts have kept up with changing forms of media. Originally adopting print and broadcast media, the DOD has been at the forefront of the Internet and social media. Advertising media and techniques will continue to evolve as the underlying technology changes. These changes will necessitate increasingly sophisticated advertising campaigns and techniques. Whereas once upon a time the DOD paid for newspaper ads, they may now choose to advertise keywords on Google. Instead of paying for ads during football games, they may choose to spend money advertising on YouTube. Regardless of the medium and the message, the fundamental premise remains the same: spending money to highlight the benefits of military service to attract recruits into the various service branches.

AERIAL REFUELING

Aerial refueling is a technique whereby a tanker aircraft transfers fuel to a receiver aircraft while in flight. This capability was developed after much trial and error, and its refinement has dramatically altered the use of combat aircraft throughout the world by allowing aircraft to carry out missions while not being based within a theater of operations. This entry discusses historical developments and then describes the aircraft, systems, and techniques used for aerial refueling.

History

Early Developments

The Russian naval aviator Alexander P. de Seversky first speculated about aerial refueling during World War I. Following the war, Seversky immigrated to the United States, became an aeronautical engineer, and developed and patented the first aerial refueling device. The Seversky system used a grapple method whereby a crewmember in the tanker reeled down a hose to the receiver aircraft that plugged into the fuel receptacle of the receiver aircraft.

With the development of this system, the U.S. Army Air Corps conducted the first aerial refueling tests in 1923. These flights, which varied in range, featured one DH-4 biplane refueling another. The Air Corps followed these tests with another in 1929. During this test, two Douglas C-1 aircraft, still using the Seversky reel and grapple method, refueled a Fokker C2A, which flew continuously for 5 days. Because of these early events, the Air Corps paced development for the rest of the U.S. military throughout the history of the technique.

Cold War Developments

Aerial refueling did not receive much attention from the Air Corps following the 1929 tests until after World War II. This changed during the early days of the Cold War when the newly created U.S. Air Force embraced a global strategic bombing mission. The new tasking of the air force spurred a new round of aerial refueling development that saw the creation of a replacement for the Seversky system as well as new tanker aircraft for the jet age.

The first alternative for the Seversky system appeared in 1949. At that time, modified B-29 bombers, using a method called the looped-hose system, refueled a B-50 that flew a nonstop flight around the world. On the basis of this success, the looped-hose method became the preferred method of aerial refueling in the air force throughout the early 1950s. At that same time, the air force looked to address deficiencies in the looped-hose system by looking for a new aerial refueling technique. From the air force's research came the two aerial refueling systems that have made aerial refueling an integral part of U.S. military operations. The first system, developed by the Boeing Corporation, uses a flyable, retractable pipe to fuel aircraft. After some trial and error, the air force adopted this boom system due to the ability to transfer large amounts of fuel quickly over long periods. This makes the "flying boom" ideal for the air force's strategic bomber and transport fleets.

The alternative to the boom system is the probe and drogue method created by Flight Refueling Limited of Great Britain. The probe and drogue system uses an arrangement where the tanker aircraft deploys a fueling hose with metal basket on the end and the pilot of the receiving aircraft flies a probe into the basket to receive fuel. In terms of usage, the air force largely phased out the probe and drogue system for the use of their strategic bomber force due to the small size of the tankers using the system. However, the air force did adopt the probe and drogue system when developing a tanker variant (KC-130) for use in refueling Combat Search and Rescue and Special Operations helicopters. Finally, the U.S. Navy saw the probe and drogue system as an ideal system because it allowed the navy to use existing aircraft as tankers.

The early Cold War period also brought the development of new tankers within the U.S.

military. To that point, the tankers used by the air force were converted propeller-driven bombers such as the B-29. However, due to the increased speeds of the service's jet aircraft, it became evident that the air force would need jet-powered tankers as well. Thus, the air force developed the KC-135 Stratotanker in 1956.

Tankers in Combat: Aerial Refueling in Vietnam, Desert Storm, and Conflicts in the 21st Century

The refinement of aerial refueling in the early Cold War period has had major implications for U.S. combat operations since that time. During the Vietnam War, when the majority of U.S. combat aircraft were stationed in Thailand, Guam, and the Gulf of Tonkin, aerial tanking allowed U.S. aircraft to perform combat operations throughout the region during the 9 years of the Vietnam War. The same held true during Operation Desert Storm in 1991. At the outset of the conflict, the United States did not possess the men or materiel in the Middle East

to conduct effective combat operations. To help close this gap, aerial tankers allowed the movement of troops and materiel to the region by transport aircraft. Moreover, once hostilities did begin, tanker aircraft played a vital role performing 15,434 refueling sorties. In addition, the U.S. aerial refuel capabilities have allowed U.S. aircraft to perform combat missions in Afghanistan and Iraq while being based outside those theaters of operation—in fact, from as far away as the United States.

Current Aerial Refueling Systems

Current aerial refueling systems and aircraft in the U.S. inventory are a blend of the systems and aircraft developed in the early Cold War period and new technologies. In terms of systems, the air force still relies on the boom system, while the navy still uses the probe and drogue system in their ship-board tankers. Moreover, the KC-135 remains the air force's main aerial tanker. However, despite the reliance on these tried and true systems and aircraft, the United States has introduced changes to the

concept of aerial refueling. On the one hand, the U.S. tanker fleet—with the addition of the KC-10 Extender to the air force fleet in 1981—is capable of refueling aircraft designed to use either the flying boom system or probe and drogue-equipped receiver aircraft. On the other hand, new versions of the KC-135 as well as the air force's next tanker (the KC-X) are capable of refueling multiple planes at the same time using multiple refueling points. These developments will ensure that the United States will maintain a strong aerial refueling capability into the 21st century.

AFGHANISTAN

Afghanistan is located in South Central Asia, surrounded to the north by Turkmenistan, Uzbekistan, and Tajikistan, and to the east and south by Pakistan and Iran. Approximately the size of the state of Texas, it is a landlocked country containing significant mountain ranges, including the Hindu Kush, as well as steppe and plateau regions. As a result, climate and precipitation vary significantly, though much of the country is characterized by a continental climate, with hot summers and cold winters. Afghanistan has an estimated population of between 25 million and 30 million, composed of a number of different ethnic groups. The capital city is Kabul, with a population of approximately 3 million. The cities of Kandahar and Herat, with populations of approximately 500,000 each, are important regional centers in the south and west, respectively. Its central location on the Eurasian landmass has subjected Afghanistan to numerous attempts at foreign influence and foreign invasions, and it has emerged in the past two centuries as a primary field of contest between global powers even as its population remains largely subsistence based. This entry examines the politics, economy, culture, and history of Afghanistan, with a focus on the rule of the Taliban and Afghanistan after the attacks of September 11, 2001.

Politics and Economy

The current political system in Afghanistan emerged from a constitutional Loya Jirga (Grand Council) established in 2003. Delegates from across the country approved a new order following the 2001 defeat of the Taliban and the subsequent selection by a multinational conference in Bonn, Germany, of an Afghanistan Transitional Administration headed by Hamid Karzai, a representative of a powerful political family and a strong opponent of Taliban rule. Promulgated in 2004, the new constitution provides for a highly centralized, presidential system. The president is head of state with responsibility for the executive, legislative, and judicial branches of the Islamic Republic of Afghanistan, including full control of the military. The president also serves as head of government; following pressure from Karzai, the presumptive president, and his supporters, no position of prime minister was created.

The constitution provides for direct elections based on universal over-18 suffrage for a president and two vice presidents, who may serve no more than two 5-year terms. Under the constitution, the president not only is charged with determining and executing state priorities but also has massive powers of appointment at all levels of government, including provincial governors. The constitution also provides a number of emergency or regulatory measures that allow the presidency legislative as well as executive power.

Two houses of parliament have limited but potentially important powers under the constitution. The lower house, the directly elected Wolesi Jirga, can approve or reject the president's choices for cabinet or the upper levels of the judiciary. It adopts laws and performs administrative tasks, including preparing annual budgets. The electoral system, which is not fixed in the constitution, nonetheless works against a chamber that can provide a counterweight to the presidency. Following his own popular election in 2004, Hamid Karzai refused to offer legal recognition to political parties, and only the names of the candidates were allowed to appear on the ballot. The Wolesi Jirga is elected through a single nontransferable vote system. In the first elections in 2005, a number of the 249 ridings featured several dozen candidates, with some winners receiving only about 10% of the vote. The upper house, the Meshrano Jirga, consists of 102 seats and is appointed by a combination of district and provincial councils and the president. Members serve terms of between 3 and 5 years. The Meshrano Jirga reviews laws created in the lower house, but its decisions can be overridden. Judicial power also reflects a powerful presidency, as only the government or lower courts, not the parliament or individuals, can initiate reviews of laws under the country's Supreme Court. The constitution requires adherence to the Hanafi school of Islamic law (the sharia), and leading judges must be trained only in Islamic law. In addition to the Supreme Court, the constitution provides for primary courts at provincial and district levels as well as appeals courts. Also recognized are informal dispute mechanisms, in particular district councils (jirgas), which, using customary alongside Islamic law, generally rule on civil, family, or minor criminal disputes.

Subsistence agriculture and family-run businesses characterize the economy for the majority of

Afghans. Wheat, sugarcane, fruits, and nuts are the main crops in a country where arable land is scarce (only about 12% of the total) and water supplies often unpredictable. Opium has risen since 2001 as a major export crop, with Afghanistan producing around 90% of the world's supply. International aid constitutes a substantial amount of Afghanistan's gross domestic product and has gained particular importance because the government cannot sustain itself through tax revenue, as the great majority of economic activity is unofficial. The country has a limited industrial base, supplying primarily cotton, textiles, sugar, and cement. Afghanistan appears to be rich in a number of minerals, including iron and copper, but these resources are yet to be tapped in any significant way. Unemployment is difficult to estimate in a subsistence postconflict economy with a high level of gray and black market activity, but it likely runs between 30% and 40%.

Society and Culture

Afghans have strong ethnic, village, tribal, and religious bonds that mediate social relations. Pashtuns are the largest ethnic group in the country, with about 40% of the population. The origins of the Pashtuns, once known as Afghans before the latter term came to designate a kingdom instead of a people, remain unclear. They appear to have coalesced from a number of migratory waves from the Middle East, Eurasia, and South Asia and asserted political dominance in the 18th century. They speak a common language, Pashto, and adhere to a common cultural code, the Pashtunwali. Governing all sorts of behavior and relationships, the Pashtunwali incorporates aspects of Islamic law and glorifies honor, bravery, prestige, and hospitality. The code stresses equality of adult males, and leadership is held through merit and reputation. Pashtuns predominate in southern areas of Afghanistan and have traditionally been a rural, and sometimes nomadic, population, though they have also formed the governing elites in urban Afghanistan. Beyond this ethnic identity, Pashtuns subdivide into a number of units based on common ancestry. Political struggles have notably occurred between the Durrani tribes, who have traditionally held power, and the Ghilzais of eastern Afghanistan.

Persians, or Tajiks, compose about 25% of the population and have traditionally formed the largest urban groups in the northern cities of Kabul and

Herat. Their settled oasis culture relied on small-scale local production of textiles and domestic goods as well as trade with nomadic peoples and along networks that connected Europe and Asia. Turkic ethnic groups, which appeared in Afghanistan beginning in the 7th century, include the more settled Uzbek peoples and primarily nomadic Turkmen. All of these groups, including the Tajiks, are found primarily in the north of Afghanistan and have substantial ethnic brethren in the Central Asian states of the former Soviet Union; strong village, kinship, and regional identities reduce the power of cross-border ethnic links, however. Among the 20 or so other ethnic groups in Afghanistan are the Hazaras, of Mongol descent, who live primarily in central Afghanistan. Unlike the Pashtuns, Tajiks, Uzbeks, and Turkmen, who are overwhelmingly Sunni Muslims, most Hazara come from the Shi'i branch and have faced persecution in the past centuries.

Islam plays a central cultural and social as well as religious role for the overwhelming majority of Afghans. The religion pervades daily life in terms of the way people see themselves and act, relate to and judge the behavior of others, and consider their place in the world. Most cultural rituals and common gatherings are related to a religious purpose. Afghans identify their Muslim background with a sense of national identity as well, as the country has resisted incursions from non-Islamic as well as Islamic powers over the course of its history. A conservative approach to Islam, combined with the patriarchal nature of the Pashtunwali, has led to the isolation and subjugation of many Afghan women, particularly in rural areas.

History: From the British to Soviet Invasions

Islam only emerged as a political force following the first British invasion of 1838–1842. Outside invaders had crossed the territories of Afghanistan for centuries, and the region had remained for long periods under Persian control before a Pashtun tribal leader, Ahmad Khan, marched into Kandahar and declared himself King of the Afghans in 1747. His ascent began the Durrani dynasty, which faced significant internal opposition from other Pashtun tribes, as well as minority ethnic groups. Dost Muhammad Khan, who assumed leadership of the Durrani dynasty in 1826, feuded with Sikh forces in the Kashmir and Peshawar regions bordering British

India. Unable to bring Dost Muhammad into their orbit, British forces invaded Afghanistan in 1838, installing a previous ruler, Shah Shuja, on the throne. Islam emerged as an important rallying cry against the foreign invaders, though only after British troops began raiding cities for taxation revenues. In 1841, the British sought to withdraw their 4,500 troops and 12,000 other support staff, but in the legendary story of an Afghan insurrection, only one Indian doctor returned alive. The British engaged in a policy of so-called masterly inactivity for the subsequent 40 years, agreeing to supply Afghan leaders with arms, until suspicions over a possible alliance of the Afghan king, Sher Ali, with Russian troops to the north prompted another invasion in 1878. Once again, efforts to install a pliable leader and pay off local chiefs had only temporary success; by 1880, British troops withdrew in the face of significant Afghan resistance, though the new monarch, Abdur Rahman Khan, proved happy to take British weapons in order to enforce his own rule. In 1893, he agreed to a border between Afghanistan and India known as the Durand Line, which left significant numbers of Pashtun tribes under British rule until decolonization, when they became a part of Pakistan.

Another failed invasion by the British in 1919 led to the international recognition of Afghanistan as a modern nation, turning the main political contest into one between young, modernist Afghans, who sought to implement greater legal rights for all citizens, including women, as well as European-style education, against tribal chiefs and religious officials, who worked to maintain traditional society. Conservative forces provoked the overthrow of the modernist king Amanullah in 1929. Afghanistan gained stability under Zahir Shah, who ruled from 1933 to 1973, but stagnated. Schools, electricity, and roads remained limited in scope, and the government largely ignored rural regions, which remained at subsistence levels, isolated from each other as well as the broader world. To make up for the lack of internal taxation revenue, Zahir Shah and his ministers manipulated Cold War rivalries to gain funds and support from both the former Soviet Union and the United States. By 1973, two thirds of the country's revenues came from foreign grants and loans.

Frustration over perceived Afghan backwardness prompted a number of secret societies among the young, university-educated elites in Kabul in the 1970s, at the same time as an Islamist movement developed in the provinces. Young communist leaders in the People's Democratic Party of Afghanistan played a role in a 1973 coup against Zahir Shah and then assumed power themselves in 1978. They introduced radical reforms that included land redistribution and equality for women. Resistance quickly developed in the provinces, and the Kabul-based communists found themselves with very few allies, unable even to find unity within their own party. Appeals to the Soviet Union for military intervention initially fell on deaf ears, as Moscow worried about the expense and consequences of being dragged into war. Fears of border instability and a potential Afghan turn toward the United States nonetheless led to Soviet troops crossing into Afghanistan on December 27, 1979, to support the Afghan communist government. Their presence prompted Afghans to rally for a jihad, or holy war, against the foreigners. The United States and Saudi Arabia, meanwhile, funded resistance movements based largely in Pakistan, with the help of Pakistan's intelligence service, the Inter-Services Intelligence (ISI). Soviet invasion forces at their height consisted of 100,000 troops, with 90,000 Afghan fighters, but they could not overcome local Afghan resistance as well as the numbers of foreign, largely Islamist forces supplied by outside powers. After years during which villages were bombed repeatedly and with even the subsistence economy severely damaged, the Soviets withdrew in 1988–1989 as their leader Mikhail Gorbachev emphasized domestic reform and positive relations with the West.

The Rise and Fall of the Taliban

Afghanistan degenerated from a proxy battle between forces loyal to the former USSR, the United States, Pakistan, Saudi Arabia, and other outside interests into a civil war in the early 1990s. The Communist People's Democratic Party of Afghanistan held on in some cities where the Soviets had made significant investments in infrastructure, but the ravaged countryside followed a number of different regional leaders. Millions left for refugee camps, primarily on the border with Pakistan, where they came into direct contact with Salafi Islamist movements.

The Soviet-sponsored government collapsed in April 1992 into a number of resistance groups of so-called mujahideen fighters, who began to organize tightly along regional and ethnic lines. The state essentially disintegrated as leaders, often called warlords, controlled districts where they had ethnic and tribal support and took turns fighting over the ultimate prize of Kabul. Against a backdrop of seemingly irresolvable violence and suffering arrived a group calling itself the Taliban, or religious students. The Taliban arose around Kandahar in 1994, apparently as a grassroots movement seeking to fight corruption and end arbitrary violence against average citizens. Many Talibs had links with Pakistan, through time in refugee camps and relationships with Islamist groups from the Soviet war. The ISI adopted the movement, supplying it with arms and advisors and allowing the Taliban to become the most coherent fighting force in the highly fractured country.

Led by the reclusive Mullah Omar, the Taliban gained control of Afghanistan in the late 1990s. Its ascendancy ended the civil war, and the movement began to implement its own policies that reflected the Pashtun background of its local soldiers and Salafi tenets imported from Pakistan and Saudi Arabia. The Taliban enacted extremely severe restrictions on women, driving them from public life where many had entered during the period of Soviet rule, and forcing them to wear full veils, or burqas. Public entertainment was banned, with the exception perhaps of the executions carried out for various crimes against the Taliban's conception of law. Islam, alongside a tacit Pashtun nationalism, served as an important rallying cry, with religious clerics for the first time assuming full power in a fractured country. Despite their Pashtun base, however, the Taliban only survived with foreign support.

Only three countries—Pakistan, Saudi Arabia, and the United Arab Emirates—officially recognized Taliban rule over Afghanistan, which received global condemnation for its brutal attacks on minorities, such as the Hazaras, its seemingly crude style of justice, and its attacks on women. The last factor in particular soured relations with the United States, as feminist pressure helped turn the Clinton administration against the Taliban, after initial hopes from some business leaders of building a pipeline through the country soured. The Taliban also sheltered, among any number of militant Islamist groups, Osama bin Laden, one of the “Arab-Afghans” who had come from Saudi Arabia to fight the Soviet invaders, who

later developed a virulent anti-Western strain of Islam along with followers he had met in the 1980s and with whom he formed the al Qaeda (the base) organization. The Clinton administration ordered a cruise missile strike against al Qaeda encampments in Afghanistan following its 1998 attacks on U.S. embassies in East Africa. Mullah Omar, although personally uninterested in spreading Islamist revolution outside Afghanistan, refused repeated global pleas to expel bin Laden and al Qaeda.

On September 11, 2001, a plot hatched by bin Laden and al Qaeda led to the hijacking of four U.S. commercial aircraft, two of which slammed into the World Trade Center in New York and one into the Pentagon in Washington, D.C., causing thousands of civilian casualties. After Mullah Omar refused to turn bin Laden over to the United States, Pakistan, its last ally, abandoned the Taliban, and the United States prepared to attack. On October 7, 2001, U.S. military operations in Afghanistan began. Ground attacks, largely through the Tajik and Uzbek dominated Northern Alliance, which had maintained resistance to the Taliban, began from the north. Rather than relying on significant ground forces, the United States used air power, coordinated by Central Intelligence Agency special operations officers on the ground. These special operations officers also used persuasion and money to turn former and present Afghan warlords against Mullah Omar's regime. Such efforts proved successful, as loyalty to the Taliban in Afghanistan was neither particularly broad nor deep and evaporated once they had provoked the strongest military power on the globe. Taliban fighters abandoned Kabul on November 12, 2001, and saw support even in their Pashtun heartland to the south melt away. Mullah Omar went into hiding, and Osama bin Laden apparently narrowly escaped capture at Tora Bora, on the border with Pakistan, in December 2001, the likely consequence of a heavy reliance on local instead of U.S. troops.

Afghanistan After 2001

The disappearance of the Taliban left Afghanistan without a functioning government, and the country lay in ruins after decades of invasion and war. The United Nations sponsored a meeting on the political future of the country at Bonn, Germany, in December 2001. Uniting various Afghan factions as well as potential donor states, the conference settled quickly on an interim government led by Hamid

Karzai, a Durrani Pashtun whose family's record of opposition and whose ability to interact with the international community trumped other potential contenders, including the former king, Zahir Shah, who had been removed in the 1978 coup. As the political system began to develop, Afghans faced a new reality: a country with a barely functioning economy and a regime sponsored by yet another foreign power, the United States. As Thomas Barfield has argued, the Afghans initially viewed U.S. troops favorably and anticipated the benefits of being linked to a wealthy state that had no obvious territorial claims on the country.

The initial U.S. presence failed to provide the Afghans with their two hoped-for goals of security and economic development. After the defeat of al Qaeda and the Taliban, the United States maintained only 7,000 troops in the entire country in 2002–2003, with an extra 5,000 from the International Security Assistance Force (ISAF) through the United Nations. Training of a new Afghanistan army also went extremely slowly; only 4,500 troops existed on paper in 2004, and many of those were poor quality. In the meantime, development work proceeded slowly, particularly outside the capital. International development funds were channeled through the Afghan government or foreign aid organizations; quickly, the population began to believe that each group was benefiting at their expense. International agencies have frequently sought to import developmental models that are not relevant to the Afghan situation and have little knowledge of the country's history or culture. Some Afghans resented the strings that came attached to aid, particularly those that had a cultural component; requiring the participation of women in certain projects, for example. Others believed that the United States lost interest in the country following the decision to invade Iraq in 2003.

Corruption rapidly became a hallmark of the new Afghanistan, emerging alongside insecurity and unemployment as a top concern of the population. Sources of and opportunities for corruption are many, from the siphoning of foreign aid to the awarding of state contracts, from smuggling to graft. Afghans have little loyalty to the new state, and for many engaging in activities that could be characterized as corrupt is a choice not just for personal enrichment but also to benefit family members or those in a particular village or region. Public offices are bought and sold at will. Local leaders see

no advantage in engaging with a centralized state other than to procure specific benefits for their home regions, from where they derive their support and legitimacy. At the same time, most of the benefits from corrupt practices remain with the elites rather than average citizens, whose standard of living remains extremely low almost a decade after the end of Taliban rule.

Opium production emerged in the 2000s as a primary tool for farmers to gain income, though many have been pressured by traffickers, including neo-Taliban forces, who use the burgeoning industry to fund a continuing and strengthening insurrection in Afghanistan. The country produces approximately 90% of opium worldwide, most of which is exported to Europe and Asia. Various Western and government efforts, including the burning of poppy fields, have failed to turn farmers away from the crop. Intensive regional eradication campaigns through powerful leaders have been shown to have some short-term success, but poppies remain a far more profitable crop than wheat or vegetables, particularly as farmers have difficulty getting foodstuffs to markets given the state of infrastructure and the local economy.

The insurrection in Afghanistan became noticeable in 2005. U.S. attention had diverted to Iraq, and the international community was not meeting obligations to supply effective aid to the state. All these factors weighed on the relatively inept Karzai government, which grew increasingly unpopular and whose authority did not extend far beyond Kabul. Forces assuming the Taliban mantle asserted themselves as U.S. troops withdrew from the south of the country, to be replaced with North Atlantic Treaty Organization forces from the United Kingdom, in Helmand province, and from Canada, in Kandahar province, in 2005. Direct military confrontations with Western troops generally ended in defeat, but the Taliban stepped up their use of improvised explosive devices in 2006. The post-2001 Taliban have stressed the national character of their resistance—the necessity to drive out the infidel and to restore Pashtun domination in the country, where the present regime is seen as overly filled with Tajiks—rather than Islamism, though elements of al Qaeda are certainly working on the Afghanistan-Pakistan border. Many of those who have joined the Taliban are in fact tribes that have lost local power struggles and seek to oust provincial governors and other officials who profess support for the Karzai government.

Instability in Afghanistan intensified during the 2009 election, which Hamid Karzai won only through massive voter intimidation and fraud. His campaign also involved renewing ties with former military leaders from the civil war era, some of whom were clearly implicated in the opium trade. The election posed great difficulties for the new U.S. administration under President Barack Obama, who had made stability in Afghanistan a key foreign policy goal. Resources devoted to the region, earmarked for military action, development projects, and police and military training have increased significantly. But the insurrection remains powerful, with more Western coalition troops killed in 2010 than in any other year: The numbers of the dead climbed from 60 in 2004 to 295 in 2008, and 711 in 2010, before dipping somewhat to 566, including 418 U.S. troops, in 2011.

The Pakistan government operates with at best ambivalent interests toward stopping the insurrection, which continues to gain strength from Pashtuns on their side of the border. Continued U.S. drone strikes on suspected al Qaeda and Islamist leaders on the Pakistan side of the Afghan-Pakistan border, which have resulted in a number of civilian casualties, have soured relations between the two countries. The ISI appear to have continued interest in supporting a Taliban return to government in the region, and the Pakistan government has periodically closed U.S. supply lines to Afghanistan, forcing the United States to use more expensive and complicated routes through post-Soviet Central Asia. The Taliban have used targeted assassinations and intimidation in addition to capitalizing on widespread disaffection with the present regime and the lack of reconstruction to become a significant resistance, launching a number of attacks in Kabul itself after 2010. The number of Afghan civilians killed in U.S. airstrikes has also helped fuel anger that the Taliban has exploited.

An Uncertain Future

Substantial challenges remain in bringing stability to Afghanistan and meeting the U.S. goal of a significant troop drawdown that began in July 2011 following a 2010 “surge” that at least contained mounting violence. Current U.S. and North Atlantic Treaty Organization plans envision a complete withdrawal of combat troops by 2014, though training

and support missions would continue. The Afghan army remains weak and, according to U.S. official and other sources, corrupt, plagued by nepotism and factionalism. Even as it has expanded rapidly in number, reaching a listed strength of 173,000 in October 2011, U.S. advisors admit that Afghan forces are far from being able to stand on their own in fighting the insurgency. The Afghan National Army, under control of the president through the minister of defense and a military commander, is trained by Western countries, with the United States serving as the “lead nation” through the Combined Security Transition Command-Afghanistan. Since 2001, the United States has provided more than \$13 billion to the army and maintains responsibility for supplying it with weapons. The Afghan National Army is divided into five combat corps across the country in an effort to reflect the ethnic balance of the country’s population. The size of the Afghanistan national police stands at approximately 115,000. Alongside the rapid growth of both institutions has been the fear of increased Taliban infiltration as well as the fear that both are far from being able to operate both independently and effectively against internal opposition.

As of May 2012, U.S. troop strength in Afghanistan numbered 90,000, up from 35,000 at the end of the Bush administration. In addition to the numbers of U.S. troops are 50,000 soldiers supplied by the 50 North Atlantic Treaty Organization or coalition countries operating under the ISAF. As of 2012, the largest forces outside of the United States were contributed by the United Kingdom, Germany, Italy, and France. The ISAF has supported a number of Provincial Reconstruction Teams that blend military and civilian missions, seeking to establish environments sufficiently secure for the effective distribution of foreign aid to projects like infrastructure and school building.

Skirmishes and attacks continue to rage across the country. The numbers of Afghan civilians killed in the cross fire, including from Taliban attacks and U.S. and ISAF strikes, has consistently risen since 2006, numbering 3,021 in 2011. The weakness of the presidency, the prevalence of corruption, the uncertainty of the international commitment to the country, and the continued strength of the insurgency combine to offer a pessimistic vision for the future. In 2010, President Karzai committed to reintegrate insurgents into mainstream Afghan

life and negotiate with so-called moderate leaders of the Taliban. Efforts to initiate peace talks have maintained a sporadic character, however. Taliban groups continue to mount effective resistance to Western forces and capitalize on their self-designated status as defenders of an Islamic Afghanistan against outsiders. The U.S. determination to withdraw combat troops by 2014 has overshadowed talk of its future commitment to the country. In the meantime, despite occasional promising signs, Afghanistan remains a country with a largely black market and opium- and foreign aid-driven economy.

AFGHANISTAN WAR

See War in Afghanistan

AFRICA, SUB-SAHARAN

The military has been, and remains, one of the most powerful institutions in sub-Saharan Africa. While some forces grew out of structures from the colonial period, others emerged from the independence movements that fought for liberation over the past half century. This entry discusses the history of sub-Saharan Africa, focusing on its exploitation by

Europeans, sub-Saharan Africa's struggle for independence, and the influence of its military.

Although some military forces have proven critical in maintaining internal security, a fair number have been instrumental in suppressing political opposition groups and undermining democratic practice within and outside their own borders. A pertinent illustration comes from the West African country of Mali.

In late March 2012, roughly a month before the presidential elections, Captain Amadou Sanogo seized control of the government of Mali. Sanogo justified the coup d'état by asserting that he and the army would squelch the Tuareg freedom struggle in the northern portion of the country. Tuareg forces repelled the Malian army, but the political vacuum brought in numerous rebel groups, including Ansar Eddine, which appears to be responsible for the sacking of historic sites in Timbuktu. Nearly half a million people have been displaced by the fighting, and a large humanitarian crisis seems to be brewing. The secessionist Tuaregs have sought international aid on the basis that they are the "new ally in the war on terror." It would be easy for Africa's critics to dismiss Mali's problems as the result of cultural inferiority or of giving people freedom before they are prepared for it. The reality of Mali's situation is much more complex and illuminates many of the larger issues regarding the military in sub-Saharan Africa.

The Scramble for Africa

Although Africa is the birthplace of humanity and boasts some of the world's oldest civilizations, modern sub-Saharan Africa is—in many ways—a very recent invention. The nations of sub-Saharan Africa grew from the violent roots of European imperialism. The Portuguese, Spanish, Dutch, French, British, and Belgians, among others, alternately explored the African coasts and pushed as far inland as possible in a colonial enterprise aimed at exploiting the vast, seemingly limitless natural and human resources of the continent. The pace of encroachment and exploitation accelerated in the mid-19th century. In the process, European interests fought with thousands of indigenous ethnic groups and among themselves. In an effort to prevent a full-blown war, Germany's first chancellor, Otto von Bismarck, organized and hosted a conference in 1884 to preserve the delicate European balance of power that the African colonization threatened.

The participants in the conference agreed to the establishment of "spheres of influence" on the continent, the respect for which relied heavily on the ability of the colonizing power to maintain a sufficient military force to police the area. The conference provided a viable outlet for the latent hostilities between European nations as they now could direct that aggression more effectively against Africans and other potential industrial interlopers (e.g., the Americans and the Japanese). The conference also created a structure for dispute resolution that could mitigate hostilities between imperialists. At the conclusion of the conference the following year, the "scramble for Africa" heated up as conference participants raced to coerce agreements with indigenous leaders and impose their military might on their spheres of influence. Within 10 years, only a handful of African states remained independent; two of those were White-minority regimes in southern Africa. In the short term, the Berlin Conference and its aftermath destroyed African autonomy and self-governance. Its legacy continues to fuel the struggle over borders, both literal and metaphorical; to wit, most of the national boundaries that currently exist were created by representatives of Europe's governments for the needs of Europe, and these boundaries failed to respect preexisting areas of ethnic settlement.

Although European domination of the continent cemented itself at the turn of the century, every colony was inherently unstable for various reasons. The serene image of functioning colonial governments, resource extraction, and peaceful White-minority settlements hid the unsettling reality of intersecting social fissures. The colonial subjects consisted of dozens—sometimes hundreds—of different ethnic groups, with multiple languages, traditions, and spiritual systems. These subjects were thrust together because of the needs of the European metropolises. Because of the "Principle of Effectivity" that emerged from the Berlin Conference, a small elite of male African leaders emerged to facilitate and maintain the colonial state. These elites claimed to act and speak on behalf of "the people," but they often found themselves facing tremendous opposition from the masses of colonial subjects.

Prior to colonization, millions of African women enjoyed an autonomy and social power unfamiliar to many women in Europe or Asia. Although pre-colonial Africa was not a utopia of gender equality, colonialism brought with it an intensification

of patriarchal norms and the removal of women from positions of political, economic, or cultural leadership. Despite the fact that many European powers justified the creation of colonies or “protectorates” as part of a “civilizing mission,” education was largely restricted to vocational training, if that. Even as the Atlantic slave trade ended, forced labor and other forms of coercion placed the brunt of economic extraction on Africans as workers. Add to these factors the constant acts of resistance to colonial rule—whether outright rebellion or work stoppages, for example—and one can understand the constant need for a strong military presence in colonized Africa. For example, the British struggled mightily to subdue the popular uprising led by Yaa Asantewaa in the Gold Coast, the Shono people staged their first Chimurenga against the British control of Rhodesia, and the Herero rebellion of 1904 ended in the Herero-Nama genocide perpetrated by Kaiser Wilhelm’s imperial forces in German Southwest Africa. The latter provides a pertinent case in point.

The Herero lived in their ancestral home known as Damaraland, part of modern-day Namibia, and herded cattle next to numerous ethnic groups, like the KhoiKhoi and the Nama. Just before the Berlin Conference, the German businessman Franz Adolf Luderitz claimed to have purchased land from the Nama. Despite the fact that the German government knew that the deal was fraudulent, it declared the area a German protectorate and the colony of German South-West Africa was born. Herero’s leadership, facing repeated attacks by the Ikhowsin people, signed a treaty of protection with the German colonial governor in 1885; importantly, this treaty did not cede Damaraland to the Germans. Over the next 5 years, Herero leaders complained to the Germans about the ineffective protection offered by the colonial military and the fact that German soldiers raped Herero women and girls with impunity.

In 1890, the son of the Herero chief made a separate deal with the Germans; in return for German assistance in making him the paramount leader of the Herero, he ceded large tracts of Damaraland to the colonial government. Immediately thereafter, the German *Schutztruppe* (protection force) came to pacify the region; most Herero were forced into slavery, and their lands and cattle were confiscated for use by White settlers. At the turn of the century, the Herero learned of the colonial government’s plan to build a railroad across the remainder of

Damaraland to connect the inland White settlements to the Atlantic coast and to remove the Herero to “native reserves.” The Herero and Nama revolted in late 1903 and early 1904. The Germans responded by slaughtering rebels and noncombatants alike, forcing tens of thousands to flee to the desert where their death by thirst and starvation was all but ensured. All survivors were herded into concentration camps, where they were used as slave labor for private enterprises or as human subjects of medical experiments.

Decolonization

Immediately following World War II, the major European powers that continued to hold African colonies intensified the extraction of wealth from their holdings as a means of reconstruction. Not only did the postwar period witness an increase in the immiseration of colonial subjects, but it also furthered radicalized nationalist movements intent on gaining independence. Even though Western leaders in capitals like London, Paris, and Washington, D.C., worried that Africans were not ready for self-governance, these movements persisted in their demands and struggles. Britain’s Gold Coast became the first independent sub-Saharan former colony, introducing itself to the world as Ghana in 1957. In 1960, 17 more nations emerged, and by the end of the decade most of the continent was no longer under direct European control. The Portuguese stubbornly held on to their colonial possessions Angola, Cape Verde, Guinea-Bissau, and Mozambique, even in the face of armed revolutionary movements. Meanwhile, the White-minority regimes of Rhodesia and the Union of South Africa clung to power by violently suppressing popular sovereignty movements and branding those organizations as “terrorist.” By the mid-1970s, the wars of independence deprived Portugal of its African holdings; Namibia and South Africa joined the parade of freedom in the 1990s.

It would be a mistake to imagine that the European powers served independence to the Africans on a silver platter. Not only did the Africans have to fight for freedom, but that freedom often came at the cost of colonial governments destroying valuable infrastructure or looting the colonial treasury. Congo’s Patrice Lumumba, for instance, explained to American diplomats in 1960 that his request for American aid was based, in part, on the fact that the departing Belgian colonial officials had stolen

the new nation's supply of gold as they left. For their part, African statesmen were unable to reach a consensus on a path toward development and self-actualization. Some, like Ghana's Kwame Nkrumah, envisioned a Pan-African future in which all of the new nations coordinated their actions toward complete freedom. Others, like Felix Houphouët-Boigny, rejected Pan-Africanism; some did so because they distrusted Nkrumah and interpreted his message as a desire to be the supreme leader of the entire continent, while others were uncomfortable submitting to a continent-wide, federated authority so soon after finally ending colonization. Adding to the shifting landscape was the intense global competition between the West and the Soviet bloc. All of the new nations on the African continent were born at the height of the Cold War. Despite the strength of the nonaligned movement that grew out of the 1955 Bandung Conference, emerging African states were compelled to participate in the Cold War, and the struggle over communism took precedence over the needs of the nations' citizens. More often than not, political independence simply ushered in a neocolonial form of domination, in which many of the new nations remained economically and politically subservient to the West.

The instability of the colonial state became the fragility of the new independent state. Few African leaders were able to successfully navigate the maze of conundrums without alienating either significant portions of their own populations or Western powers (or both). Others simply used the power of the state for personal aggrandizement. Many of the new states' economies relied almost exclusively on exports of agricultural raw materials rather than finished products. In states that tolerated multiple political parties, most were formed along singular ethnic or religious lines. Because the very idea of the nation-state was unclear and contested, so too was the identity of each state's citizens. Many of the competing ethnic groups that had been compelled to live together under colonialism felt only a hazy connection to one another in the postcolonial nation. Numerous individuals and groups within each ethnicity yearned for or celebrated a romantic precolonial past. Thus, it was not clear which group or groups were entitled to control the state or enjoy its benefits. Women, fearful of being shunted aside again by the new emphasis on development and/or industrialization, organized against formal

institutions of power. National leaders leaned heavily on military power to hold their nations together, to maintain personal power, or to attain control of a government. In 1960, Lumumba relied on Soviet munitions (after the United States declined to provide assistance) to combat the Katanga secession. On the opposite end of the political spectrum, the conservative leader of Gabon, Leon M'ba, survived a military coup only through the intervention of French paratroopers. It is worth noting that the Gabonese public objected to the French intervention and saw M'ba's dissolution of the National Assembly—an act that precipitated the coup—as a quest to further consolidate his personal power. Yet, because of French military dominance, the people and the organized opposition could only protest the restoration of M'ba and regard him as a stooge of the French. A similarly combustible mix of factors also played itself out in the Nigerian civil war.

The civil war in Nigeria, also known as the Nigeria-Biafra War, began in the summer of 1967 and lasted for about 2½ years. The conflict grew out of the secession of southeastern provinces that declared themselves the “Republic of Biafra.” Several interlocking factors formed the foundation for the crisis: (a) competition between British, French, Dutch, and Italian oil companies for control of the vast Nigerian oil fields; (b) the British colonial legacy of having divided Nigeria into three distinct regions; (c) competition between and among the dominant ethnic groups from the separate regions—the Igbo, Yoruba, Hausa, and Fulani; (d) an attempted coup d'état and countercoup by junior military officers; and (e) religious intolerance exacerbated by accusations of electoral fraud. The countercoup resulted in the ascendance of Lieutenant Colonel Yakubu Gowon's rise to power; Gowon was a Christian from the largely Muslim north of Nigeria and hailed from a minority ethnic group. When the Igbo-dominated southeast declared itself an independent state on May 30, 1967, the Gowon-led military government met with the secessionists and hashed out several different accords. However, all of the efforts to create a new form of national unity collapsed, and the military government initiated a “police action” on July 6. Although the war was primarily a stalemate for roughly the first year of fighting, the Nigerian army eventually encircled the Biafrans and imposed a blockade that launched a humanitarian crisis. With British support, the

Nigerian army ultimately forced the Igbo surrender through a major offensive that captured several Biafran towns by January 11, 1970. Many officials estimated that up to 3 million people lost their lives (mostly through starvation and disease) due to the war. The problems of Biafran secession are echoed in the contemporary struggle of the minority Ogoni people, who have protested against oil extraction and environmental devastation by Royal Dutch Shell, even as the Nigerian military has sought to violently suppress this mass movement.

In more recent years, foreign investment in sub-Saharan Africa by powers like China has complicated the political and social landscape. Some observers believe that the competition for oil between China and the United States was at the root of the genocide in the Darfur region of Sudan, which ultimately led to the bifurcation of the country. The weakness of the Democratic Republic of the Congo is borne out by both the war-induced atrocities against women and children and by the state's inability to formalize the coltan mining industry. Columbite-tantalite, or "coltan," is a mineral critical to the high-tech economy—some suggest that it is the lifeblood of gaming systems, cell phones, computers, and tablets. Business interests from across the developed world appear to be fueling proxy wars in Central Africa as a means of controlling the price and supply of coltan. In an interesting twist, Chinese investment in Angola has significantly enhanced the latter nation's economy. However, because of the historic lack of an Angolan professional class, Portuguese migration to its former colonies has increased dramatically. Portuguese professionals who cannot find gainful employment in their recessionary home economy are flocking to Angola for work as engineers, lawyers, and managers, among other things. External intervention has taken many forms and often exacerbates military relations with civil society, which brings us back to Mali.

Over the past 10 years, commentators on Malian society have asserted that the U.S.-led initiatives to have the central government crack down on northern Islamic groups have created a crisis where none had existed. Despite the close relationship among the government, the military, and the U.S. African Command, Mali has become less stable rather than more secure; the noted historian Vijay Prishad blames U.S. African Command for providing a perverse incentive to the Malian state to take a military

approach to the question of Tuareg self-determination. The aforementioned Sanogo was trained under the U.S. African Command, and his actions not only undermined democracy but, by fostering instability, strengthened the military at the expense of civilian authority. Not all military institutions in sub-Saharan Africa behave in this way. The following discussion provides examples of the size, influence, and professionalism of Africa's armies.

Africa's Armed Forces

West Africa

Although Ghana has one of the smallest standing armies (active troops per 1,000 citizens) in the world, it is considered to be one of the continent's most professional and up-to-date armed services. The military was formed on independence in 1957 and remained out of politics for the next decade. However, the military asserted itself into civilian politics by staging a number of coups from the late 1960s into the 1980s. At present, Ghana's three service branches—army, air force, and navy—have roughly 7,000 active personnel. Ghana's soldiers have consistently participated in UN peacekeeping missions on the continent and in other parts of the world, like Lebanon.

The Nigerian army grew out of a colonial precedent, the Royal West African Frontier Force. The Nigerian military fought in a civil war in the late 1960s—the Biafran War—and has participated in peacekeeping missions abroad. However, the defeat of secessionist forces gave exaggerated importance to the military in both resources and national power. As a result, the military has consistently intervened in national politics and suppressed civilian dissent, whether in the form of ethnic/religious violence or regional communities' protests against multinational corporations. Perhaps because of its level of activity in and outside the nation, the Nigerian Armed Forces are one of the continent's largest, with roughly 85,000 soldiers. Traditionally, many of its officers have trained in Pakistan.

In Guinea, the army—like the government—received its principal support from Eastern bloc countries. When Prime Minister Sekou Toure uncovered a plot within the army leadership to overthrow him or lead a secession of central provinces, the Toure government developed the militia into a counterweight against perceived political subversion.

Guinea's soldiers tried to maintain peace in Sierra Leone during the early 1970s and were part of a UN peacekeeping mission in their neighboring country from earlier in this decade. Following the death of Toure in 1984, Lansana Conte led a military coup against a transitional government. Conte left the military but used the loyalty gained in his former position to stifle democratic reforms. In time, he faced growing opposition from his former comrades in arms in the early 1990s, especially regarding their poor living conditions. With nearly 20,000 active personnel and 1,800 reserves, the Guinean military constituted a formidable threat to civilian authority. At present, Captain Moussa Camara is the nation's leader; Camara declared himself president following the death of longtime president Conte in 2008.

East Africa

Ethiopia maintains one of the world's largest armed forces, ranking 23rd with roughly 400,000 troops. Although Ethiopia's military traditions span a millennium in this very old nation, its modern forces were organized in the late 19th century and achieved global fame during the First Italo-Ethiopian War, when they defeated an Italian invasion force at the Battle of Adwa in 1896. Under Emperor Menelik II, the professionalization of the armed forces continued as Ethiopians defeated British colonial forces in skirmishes that were part of imperial expansion efforts during the Second Boer War. At that time, Ethiopian officers also received training in Czarist Russia. The modernization of the Ethiopian armed forces continued under Emperor Haile Selassie and accelerated after the Ethiopians liberated themselves from Mussolini's grip in 1941–1942. As the Cold War dawned, Ethiopia remained a staunch ally of the United States and sent more than 3,000 combat troops to Korea. The Ethiopian Revolution of 1974 that toppled Haile Selassie also led the new government to turn to Eastern bloc nations for training and resources. It was in this period that the military grew substantially and honed its conventional and guerrilla tactics in the Ethiopian Civil War, campaigns against Eritrea, and conflicts with the Somalis during the Ogaden War. With the collapse of the Soviet Union and the rise of concerns regarding Islamic fundamentalism, Ethiopia has joined the U.S. Global War on Terrorism and has invaded Somalia on numerous occasions under the pretext of combating potential terrorist organizations. In addition,

Ethiopian troops have served in UN peacekeeping missions from Liberia to Darfur.

The military in Sudan has maintained a central place in national affairs because of long-standing conflicts between the North and South of the nation. The military is quite large, by African standards, with more than 100,000 soldiers, nearly as many reserves, and 17,500 paramilitary personnel. Although the British colonized the entire area of modern-day Sudan, they administered the two regions separately. This division was reflected in the establishment of competing military forces—the Sudan Defence Force in the north and the Equatoria Corps in the south. Prior to independence, the south sought self-determination because it considered itself culturally, linguistically, and religiously distinct from the north. However, Britain gave Sudan independence as a unified sovereign state, resulting in ongoing conflicts that began, in part, with the mutiny of the Equatoria Corps in 1955 (with a slight lull in fighting from 1972 to 1983). Toward the end of the first civil war, army officers in the north took power in Khartoum and only allowed for a civilian-led government following a negotiated peace settlement in 1972. In the wake of the second civil war (which technically ended in 2005), Khartoum relied on militias to augment the regular fighting force. These paramilitary forces have been alleged to be responsible for genocidal attacks on southerners over the past decade. Neighboring countries like Egypt and Libya have sided with the central government and military, while other nations like Ethiopia, Uganda, and Kenya have supported the Anya Nya independence movement. At the height of the Cold War, the United States provided more than \$100 million to Sudan over a 5-year period. However, the national government and the military find their primary support from China, Russia, and Iran.

Just south of Ethiopia, the military in Kenya has maintained a largely favorable reputation. Because British colonial Kenya had a large White settler population, there was no 19th-century precedent for the current armed forces. The British did raise a multi-battalion regiment of soldiers from their East African colonies known as the King's African Rifles (KAR). The KAR included such diverse personalities as Idi Amin, Roald Dahl, and Hussein Onyango Obama (the current U.S. president's paternal grandfather). The KAR fought in British expansionist missions in Somalia, then in World Wars I and II. However,

the units of the KAR in Kenya that became chiefly responsible for suppressing the Mau Mau rebellion of the 1950s included some Indians and Somalis and excluded Kikuyu and Kamba, the ethnic groups that made up nearly half of the indigenous population. Like the military in other African nations, the Kenyan armed forces have participated in numerous peacekeeping operations. Despite its size—roughly 65,000 active service members—the Kenyan military has not overtly asserted its influence on civil society. In addition to avoiding the appearance of impropriety with respect to civilian authority, the Kenyan military has been commended for integrating female soldiers into regular units (in 2000). The country as a whole has maintained remarkable stability in its multiparty representative democracy. However, because the service charter stipulates that the armed forces “will defend the country and . . . support the Civil Power in the maintenance of order,” Kenya’s military has intervened in domestic disputes—most notably in the violence that followed the 2007 national elections.

Central Africa

One of the worst hotspots on the continent is in central Africa, and the military in Burundi is representative of some of the institutions responsible for continued hostilities and atrocities in the region. Burundi became an independent nation in 1962, when the Belgians agreed to decolonization and separated the UN mandate territory then known as Ruanda-Urundi. Despite Burundi’s launch as a constitutional monarchy, Burundi played host to tremendous ethnic conflict between the majority Hutus and the minority Tutsis, like its more famous neighbor Rwanda. Almost immediately, the military played a role in installing or sustaining anti-democratic regimes in the country. In 1965, King Mwambutsa IV after the assassination of the elected Hutu prime minister—Pierre Ngendandumwe—appointed his private secretary, a Tutsi, as prime minister. The military violently suppressed Hutu dissent that resulted from this decision. In 1972, the military again struck at the Hutu population and created the simmering political conditions that ultimately led to civil war in 1993; over the years, this repression included purging Hutus from the nation’s security apparatus. The flashpoint of 1993 was particularly significant because of the assassination of Melchior Ndadaye—the first democratically elected

president and a Hutu. Fighting within Burundi spilled across its borders in Tanzania, Uganda, the Democratic Republic of the Congo, and Rwanda. Complicating matters, regimes in Congo have funded some Burundi rebel groups while Burundi’s army and other militias have sought to destabilize the government in Kinshasha. Given the developments over the past few years, perhaps civil society will be able to rein in the Burundi military. Although peace accords have been notoriously fragile, the transformation of the last rebel group—the Forces for National Liberation—from a paramilitary to a political organization is an important step toward stability. Moreover, the ethnic integration of the government—now composed of 60% Hutus and 40% Tutsis—is a cause for optimism. However, fear over resumed violence remains, partly, because (a) the issue of integration of former rebel forces into the Burundi military remains unresolved and (b) most of the political parties boycotted the 2010 summer elections.

Southern Africa

The Armed Forces for the Defence of Mozambique emerged from the 1992 peace settlement of the young nation’s civil war. By 1994—and with the help of nongovernmental organizations and UN mediators—the Armed Forces for the Defence of Mozambique grew from the integration of rebel forces with the military units of the revolutionary government. Given the tremendous strides made by civil society organizations and the increasing legitimacy of the government, the military in Mozambique has remained subordinate to civilian command. The ability of the democratization to take hold also is indebted to the end of the Cold War and the collapse of the apartheid regime in South Africa. It is worth mentioning that no disturbances followed the president’s firing of the defense chiefs in 2008.

Although the Republic of South Africa (formerly called Union of South Africa) has a military tradition dating back to the 16th century, the South African National Defence Forces grew out of the first postapartheid elections in the nation in 1994. The precedent for South African National Defence Forces supported the racist repression of indigenous African populations and was a major source of destabilization and violence throughout the region. The new military was constructed on a

mandate from the new constitution and grows from a blending of the traditional forces and the guerrilla factions of the African National Congress and Pan Africanist Congress. The new military is divided into four units—army, navy, air force, and Military Health Service—and has active personnel of nearly 75,000.

Budget

Another way to assess the influence of the military in sub-Saharan Africa is through the governmental budget process. With a handful of exceptions—like South Africa and, more recently, Sierre Leone—most of the nations in Africa lack strategic defense plans, threat assessments, and comprehensive and transparent budgetary guidelines. These public management gaps mean that there can be little accountability in procurement, unnecessary redundancies, and waste. Even in countries in which the military budget comprises a relatively small portion of government spending, these problems can lead to the exaggeration of military “necessities,” corruption, and an environment in which civilian authority becomes fragile.

Conclusion

Given the lack of consistent civilian control over Africa’s various militaries, it is likely that militaries will maintain an exaggerated influence on the continent for the foreseeable future. Because the national boundaries of current African countries were based on the colonial lines drawn in Berlin in the 19th century, many observers imagine that African nations will either expand or shrink to fit the needs of their various peoples. For good or ill, the military will help shape the evolution or devolution of African nation-states.

AFRICAN AMERICANS

On October 1, 1989, Army General Colin Powell became the first African American chairman of the Joint Chiefs of Staff. His ascension to the highest uniformed post in the military was a personal triumph for Powell and for all African Americans in the military. It was also the culmination of more than 200 years of effort by Blacks to serve their nation and to be recognized for it. This entry discusses the history of African American men and women in the U.S. military and examines racism and integration in

the armed forces and the fluctuating enlistment rates over the years.

Military Service in the 18th and 19th Centuries

The history of African American military participation in the United States is one of the most striking examples of the connection between a people's right to bear arms and their concurrent quest for full and equal citizenship. African Americans have served in all of America's wars, often in segregated units and with little or no official recognition. There were Black minutemen at Lexington and Concord and at Bunker Hill, and approximately 5,000 African Americans saw service with the Continental Army. After the revolution, the new federal government banned Black Americans from serving in the Militia in 1792 and in the Regular Army in 1820. The restrictions on service were lifted during the Civil War in July 1862, and nearly 186,000 African Americans served as soldiers, accounting for nearly 10% of the Union Army's strength, while another 30,000 served in the Federal Navy. Black sailors served on integrated ships, but the United States Colored Troops served in segregated units. The vast majority of officers and noncommissioned officers (NCOs) in the Black regiments were White, but about 100 African Americans served as commissioned officers and another 7,000 as NCOs. Approximately 38,000 Black Americans died in the war. The Army Reorganization Act of 1866 led to the formation of four Black regiments, the 24th and 25th infantry and the 9th and 10th Cavalry, the famous "Buffalo Soldiers" who served with distinction during the Plains Indian Wars. Black regulars also fought in the Spanish-American War of 1898, earning the sobriquet "Smoked Yankees" from their enemy.

America's entry into World War I in April 1917 gave Black leaders a new opportunity to press the War Department for change. Both Black liberals and conservatives believed that it was essential for African Americans to serve in the armed forces and prove their capabilities to a skeptical White America. Military service was a way to prove that Black men could be loyal, disciplined, and capable, as well as an opportunity to make their case for increased civil rights.

Military officials, however, envisioned a very restricted role for Blacks, primarily as service troops, and largely under the command of White officers.

The army's policies reflected this view. No Black combat divisions were initially envisioned. Fourteen new officer training candidate (Officer Candidate School, OCS) camps were established for Whites, but none for Blacks, and the highest ranking African American officer, Lieutenant Colonel Charles Young, was retired by the U.S. Army due to high blood pressure. Some Black leaders feared, incorrectly, they would even be excluded from the draft.

Eventually, more than 367,000 Blacks, representing 13% of draftees, would be inducted through the Selective Service. Pressure from the Black community on President Woodrow Wilson and Secretary of War Newton D. Baker led to the establishment of the first Black officer's training camp in U.S. history, Camp Des Moines, in the summer of 1917, with 639 of the 1,250 officer candidates receiving commissions. The vast majority of the 390,000 African Americans serving in World War I did so in labor and service battalions, but two all-Black combat divisions, the 92nd and the 93rd, were organized. The 93rd division, under French command for much of the war, established a superb record, but the 92nd performed poorly and was held up as an example of Black incompetence by White officers.

Modest gains were made in the years prior to World War II. In 1936, Benjamin O. Davis Jr. became the first Black to graduate from West Point since Charles Young in 1889, and in October 1940, his father, Colonel Benjamin O. Davis Sr., became the first Black general in the U.S. Army. The Selective Service Act of 1940 prohibited discrimination based on race or color and stated that Blacks would be drafted roughly equal to their proportion of the overall population, slightly more than 11%; 2,438,831 African Americans were drafted, 10.7% of the total inducted.

The pace of reform accelerated after the United States entered World War II in 1941. President Franklin D. Roosevelt ordered the U.S. Navy and Marine Corps to begin accepting Black recruits by the summer of 1942. The navy opened officer training to African Americans, and by 1945 there were 50 Black commissioned officers in the U.S. Navy. There were 7,768 Black officers in the Army and Army Air Corps, although all but 8 were company grade.

Senior political and military officials supported increased opportunity for African Americans. The all-Black 92nd and 93rd infantry divisions were

reconstituted, and Blacks would serve in every major Military Occupational Specialty (MOS) during the war, including fighter pilots such as the famous “Tuskegee Airmen,” and in armored formations, like the 761st Tank Battalion, which served under General George S. Patton in Europe. But the vast majority of Black service personnel would serve in service and labor battalions, as in World War I. Only about 50,000 Blacks would serve in combat units.

The same civilian officials who were willing to support increased opportunities for Blacks were not willing to openly support integration, arguing that it could cause racial friction in the services and seriously impair the war effort. In fact, racial friction and violence did occur during the war on several stateside bases by mid-1943; the most notable examples occurring at Camp Breckinridge, Kentucky, and San Luis Obispo, California. This was largely due to segregation and discrimination. Despite official policy, numerous facets of military life were being quietly integrated. In March 1943, the War Department ordered integrated recreational facilities, post exchanges, and transportation facilities on all stateside bases. The army was also abandoning segregation at all its officer training camps, with the exception of those training pilots, and had also desegregated its specialist training schools. The integrated camps were more efficient, were cost-effective, and reported far less racial friction than the segregated ones. Even some combat units saw some limited integration. During the Germans’ Ardennes offensive in December 1944, more than 2,500 Black service troops volunteered to be retrained as combat infantry men because they were promised that they could fight alongside White soldiers. White officers protested the plan, however, so the men were assigned to all-Black platoons, but in previously all-White units.

Integration and the Vietnam War

On July 26, 1948, President Harry S. Truman issued Executive Order 9981, calling for “equality of treatment and opportunity for all persons in the Armed Services without regard to race, color, religion or national origin,” thereby effectively desegregating the armed forces. But the army and the Marine Corps, in particular resisted implementing the order until the outbreak of the Korean War in 1950.

In both the World Wars, military officials had argued against attempting to integrate the armed

forces during hostilities, but just the opposite occurred during the Korean War. In August 1950, 2 months after hostilities began, the army began integrating training units and implemented what best could be described as “battlefield integration” in Korea as replacements were shipped out to combat units regardless of race. Far from hampering military efficiency, the integrated units performed quite capably in the field. After decades of resisting racial change, the armed forces now embraced their new role as a social laboratory, presenting the services as a shining example of racial cooperation and equal opportunity. It did increase efficiency and reduce costs, and made wonderful Cold War propaganda, both at home and abroad.

Throughout the late 1950s and early 1960s, both institutional and personal racism remained major problems. But for all its faults, the military on the eve of the Vietnam War was easily the most integrated and racially egalitarian institution in America, and a model for civilian society. Even the growing war in Vietnam was initially viewed as an opportunity to demonstrate the merits of integration, but events proved that the military’s highly vaunted success in race relations was somewhat illusory. Many African Americans entering the service in this era were more militant than their predecessors. Racism, both personal and institutional, remained endemic to the system, particularly in testing and placement, and in military justice. Inequities in the Selective Service System meant that African Americans and poor Whites assumed a disproportionate responsibility in fighting the war and, early in the conflict, a disproportionate share of the casualties.

African Americans reacted to these conditions with a heightened sense of Black solidarity. In Vietnam, many chose to bunk in all-Black “hooches,” or living quarters, often flying a black, red, and green “Black power flag.” Many wore the symbols of Black solidarity, such as Afro haircuts and “slave bracelets” woven out of boot laces, and saluted each other with a Black power salute—a clenched fist raised in the air. The most popular expression of solidarity, however, was a ritualized handshake with numerous variations, known as the “dap.” Dapping was deeply meaningful for Black servicemen, but it could often take several minutes to complete and was often performed in inopportune places, such as chow lines, adding to the growing friction between Whites and Blacks in the military.

Preoccupied with the quagmire in Southeast Asia, military authorities ignored growing signs of racial unrest, especially after the assassination of Dr. Martin Luther King Jr. in April 1968. Racial unrest exploded into racial warfare in August 1968, when gang fights erupted at two military prisons in Vietnam, the DaNang brig and the Long Binh stockade. In July 1969, there was violence at Camp Lejeune and at Millington Naval Air Station near Memphis, Tennessee. The navy also saw its share of violence at sea with major racial confrontations occurring on the carriers *Kitty Hawk* and *Constellation* and the oiler *Hassayampa* in the fall of 1972. African Americans no longer viewed military service as a route to advancement but as an undue burden on the Black community, and many Black leaders, including Dr. Martin Luther King Jr. before his assassination in 1968, counseled young Blacks to avoid military service. Toward the end of the Vietnam War, the military's reputation as a model in race relations appeared irretrievably lost. One indication of this was the reenlistment rate for Black veterans. In 1966, more than two thirds of Black veterans chose to reenlist in the armed forces, but by 1972, only 20% did so. The military also witnessed declining first-time enlistments as well.

Post-Vietnam Recruitment and Retention

After Vietnam, the armed forces would regain much of their former reputation. In the early 1970s, they instituted meaningful reforms aimed at eliminating racism and ensuring equal opportunity. The end of the war in Vietnam, coupled with an economic recession in the 1970s, meant that the armed forces once again became an attractive career option for many African Americans, who were joining and staying in the military. By 1983, Blacks made up 33% of the army, 22% of the Marine Corps, 14% of the air force, and 12% of the navy. In 2000, 23.5% of the army's recruits were African American.

The typical African American recruit in the early 21st century was more likely than the national Black average to come from a two-parent family and be a high school graduate. In 1994, 99% of Black army-enlisted personnel were high school graduates. The reasons African Americans chose the military in such large numbers, however, had not changed much since the Vietnam War, such as the difficulty of getting a higher education. According to a study conducted at Texas A & M University, only 12.2% of

Blacks earned bachelor's degrees in 1993, compared with 22.6% of Whites. In 1997, the unemployment rate among African Americans was 2.3 times the rate for Whites. African Americans who did find good jobs in the civilian sector were often underpaid; in 1997, employed African Americans earned only 77% of the wages of Whites in comparable jobs. African American enlistees tended to come from households above the Black national average in income, earning roughly \$32,000 compared with an average of \$27,900.

African Americans stayed in the armed forces because there were greater opportunities in the military than there were in the civilian sector. By 1981, the reenlistment rate was above 80%. A 1999 Pentagon study of job satisfaction, gender, and ethnicity found that African American and Latino men and women in the U.S. military had a higher job satisfaction rate than did White men. There were several reasons. The Pentagon was serious about racial reform and made Affirmative Action the cornerstone of its equal opportunity policies. Because of the large numbers of African Americans in the armed forces, Affirmative Action programs could be linked with high performance standards, making it highly successful. The Department of Defense (DOD) has a Human Goals Charter for Military and Civilian Personnel, which is updated by every new secretary of defense. It details the DOD's assurance to ensure equality and equal opportunity for all DOD employees regardless of race, color, sex, religion, and national origin. Advancement would be based on merit. The Equal Opportunity program, under Army Deputy Chief of Staff, G-1, Human Resources, creates opportunities and programs to ensure fair treatment for all, and in 2007, the army established the Diversity Task Force to review its diversity programs.

The reforms were successful partly because there were now more African American officers and NCOs. African Americans were now over-represented in the senior NCO ranks. Black senior NCOs in the army increased from 14% in 1970 to 26% in 1980 and 31% in 1990. African Americans accounted for only 2% of the officer corps throughout much of the Vietnam War. The army had the highest total, with between 3% and 4%, but the other branches had far less. The air force averaged about 1.7%, and as late as 1971, there were 234 African Americans out of 19,905 officers in the

Marine Corps—only 1.2% of the total officer corps, the highest ranking being a lieutenant colonel. The navy's record was even worse; in 1972, the 660 African American officers in the navy were only 0.9% of the total.

Aggressive recruiting of African Americans by the services beginning during the Vietnam War, greatly increased the percentage of Black officers by the early 1980s; the percentage had risen to more than 6%. By 1989, 10.6% of the army's officer corps was African American, the highest for any of the uniformed services; Black officers accounted for 5.4% of the air force and 5% of the total for the Marine Corps; the navy was the lowest with only 3.6%. The total for all of the armed forces at 6.15% was not much higher than it had been during the 1980s, but there were now more African Americans—men and women—in senior positions. In 1968, there were only two African American generals and no admirals among the 1,342 flag and general officers in the armed forces. In 1971, Samuel Gravely became the first Black admiral in the history of the U.S. Navy. By 1974, there were three African American air force generals. By 1990, there were 28 active duty Black generals in the army. Twenty years later, in 2010, there were 16 African American flag officers in the navy and 12 air force generals, but no Black four-star general currently serves on active duty and African Americans account for only 5.4% of all general officers.

In the first decade of the 21st century, African Americans were more likely to serve in the regular forces than in the reserve or National Guard. Black soldiers make up almost 20% of the active-duty army and nearly 40% of the navy's enlisted ranks but only 13.3% of the National Guard and 22.1% of the Army Reserve. In the army, they tend to be concentrated in two areas. Blacks constitute 30% of the noncombat Military Occupational Specialties (MOSs), such as administrative, medical, and support, and upward of 40% in many combat units. African Americans volunteered for combat units for many of the same reasons their predecessors had, such as for prestige and economic incentives. There are two reasons for the concentration in noncombat specialties. African American enlistees often join up to further their education or career options and tend to choose a noncombat MOS, especially one that might help them later in civilian life. The other reason is the high proportion of women recruits, who are still barred from most combat MOS.

In 2008, for example, African Americans made up 20% of the male enlistees but 33% of the female volunteers. Serving in Iraq or Afghanistan in a non-combat MOS was still extremely dangerous. There is really no front line on the modern battlefield, particularly with the nonlinear warfare practiced by the opposing forces in those wars.

Black women were also making important advances in the military, and at all levels. In September 1979, Hazel Winifred Johnson became the first Black woman promoted to brigadier general in the army. In 1997, Army Sergeant Danyell Wilson became the first to serve in the elite guard detachment at the Tomb of the Unknowns at Arlington National Cemetery, and in 1999, Major Shawna Rochelle Kimbrell became the first female African American fighter pilot in the air force. In September 2011, Marcia M. Anderson became the first African American female major general in the army.

Vestiges of Racism

The racial violence that had plagued the military during and immediately after the Vietnam War has subsided. The Pentagon reported no major incidents of racial violence in the First Iraq War, Bosnia, or Somalia. A 2006 Pentagon study found that while three fourths of minority personnel reported experiencing some form of racist behavior, it was generally in the form of racist jokes or disparaging remarks. The military had been relatively successful in eliminating personal and institutional racism, but vestiges of both still lingered. Two high-profile cases in particular led to charges of racism in the military justice system. In late 1996 and early 1997, the army charged 12 African Americans—a captain and 11 NCOs—at the Aberdeen Proving Ground with the rape and sexual harassment of numerous female recruits, the majority of whom were White. A company commander and three drill sergeants were found guilty and given prison sentences. The most severe punishment was handed out to Delmar G. Simpson, who was convicted of raping six women and sentenced to 25 years. The other eight defendants were either discharged or punished administratively. The Congressional Black Caucus expressed its outrage over the case, as did the NAACP (National Association for the Advancement of Colored People), which demanded an independent investigation of the case. That same year, an African American sergeant major of the army, Gene

McKinney, was acquitted of adultery, indecent assault, and mistreating and threatening soldiers but was found guilty on one count of obstruction of justice and demoted one rank to master sergeant. An inquiry into both cases by the army's inspector general concluded that the charges of racism were without merit, but nonetheless, a Pentagon study conducted that year found that Black military personnel were far more likely than Whites to believe that racism affected their military careers.

Pockets of personal racism remained as well, largely in the form of individual or small groups of skinheads and neo-Nazis in the ranks. In 1997, three soldiers stationed at Fort Bragg, North Carolina, were convicted of the murder of a Black couple in Fayetteville in December 1995. All three were avowed neo-Nazis, and two of them belonged to White supremacist organizations. Officials subsequently identified 22 more soldiers at Fort Bragg who belonged to White supremacist groups; all were discharged and barred from reenlistment. A 1999 Pentagon survey of 76,000 active-duty personnel concluded that organized hate groups were not an extensive problem; however, this finding was contradicted by a 2008 FBI (Federal Bureau of Investigation) report reflecting concern that White supremacists were recruiting military personnel and that there were "hundreds" of neo-Nazis in the active military. In 2009, a random Internet search by the Southern Poverty Law Center found 40 active-duty U.S. soldiers who were members of one particular neo-Nazi social networking site alone. That same year, the Pentagon issued its third directive in 20 years aimed at eliminating right-wing extremism from the ranks; it was updated early in 2012 and directs commanding officers to monitor possible racist blogs and websites by military personnel and to take immediate action to stop them when found.

Military Operations From Desert Storm to Afghanistan

The military was involved in several operations in this era, and African Americans played a prominent role in all of them. On January 17, 1991, Operation Desert Shield became Operation Desert Storm, otherwise known as the First Iraq War. The United States deployed 696,778 personnel to the Middle East, and African Americans were overrepresented, accounting for 24% of the total. Much like in Vietnam, they tended to be concentrated in infantry

and other combat formations, constituting 30% of the army ground forces. Overall, American casualties were relatively light; 382 Americans were killed in the conflict, of whom 66 were African Americans, including 3 women, accounting for 17.3% of total fatalities.

African Americans participated in Operation Restore Hope (later UNOSOM II) in Somalia from April 1992 to March 1995, and on October 7, 2001, they were part of Operation Enduring Freedom, the invasion of Afghanistan, as well as serving in Grenada, Panama, Bosnia, and Serbia. Unlike the Vietnam War and the Persian Gulf War, African Americans did not bear a disproportionate share of the dying; Black casualties in these conflicts were relatively low. In Iraq, between 2001 and the end of American military operations in December 2011, 4,487 American troops were killed, with African Americans accounting for about 9% of the total casualties. The percentages were similar for Afghanistan; from 2001 to 2009, African Americans were 17% of the total forces committed to that conflict but accounted for only 9% of the dead. Surprisingly, the proportion of African Americans among total deaths in the military is much higher. Between 1980 and 2010, Black men accounted for 17.3% and Black women for 26.6% of the total deaths by all causes in the armed forces.

Decline in Black Enlistments

African Americans had generally supported U.S. military operations, but that changed with Operation Iraqi Freedom—the invasion of Iraq in March 2003. Polls conducted prior to the invasion indicated that only 19% of African Americans supported a war with Iraq compared with 58% of Whites. As late as 2009, a Gallup Poll found that 85% of African Americans thought the war was a mistake compared with 53% of Whites. Coupled with other factors, the result was a noticeable decline in Black enlistments. By November 2005, only 13.9% of Army recruits were African American; Black enlistments had declined nearly 40% since 2000. African Americans were also less dependent on the military than in the past for educational or career opportunities. From 1980 to 2002, the percentage of African Americans above 25 years and with at least 4 years of college has risen from 7.9% to 17.2%. The economic downturn that began in 2007, however, is likely to spur Black enlistments again. In 2010, the

national unemployment rate was at 9.7%, but for African Americans, it was 15.8%.

AGENT ORANGE

Agent Orange was an herbicide mixture deployed during the Vietnam War to defoliate the thick jungle canopy that served as camouflage for North Vietnamese troop movements against South Vietnam and its allies. Its use has been banned by the U.S. Department of Defense since 1970. From a tactical military sense, the use of Agent Orange was very effective in eliminating the concealing vegetation and thereby exposing enemy movement and concentration of force. From a humanitarian sense, the use of Agent Orange led to increased illness and death due to the toxic effects of a contaminant—2,3,7,8-tetrachlorodibenzo-para-dioxin (TCDD), one of the dioxins. Due to the long half-life of dioxin, toxic levels have persisted in the environment, and the full extent of contamination is only now being realized—almost two generations since the last use of Agent Orange. This entry describes the chemical makeup of Agent Orange and the use of Agent Orange in Southeast Asia in the 1960s and examines research studies and lawsuits related to the use of the defoliant during the Vietnam War.

Background of TCDD

As U.S. military involvement in Vietnam escalated in the 1960s, air superiority was established and maintained. Air reconnaissance missions to collect enemy troop information were hindered by the thick foliage in much of the theater. The need to defoliate led to the use of herbicides. Agent Orange was one of the rainbow herbicides (Agent Pink, Agent Blue, etc.) used by the military for this purpose. Agent Orange constituted about two thirds of all herbicides used during the Vietnam conflict because of its broad range of activity on plant cell processes.

The phenoxy herbicides evolved from research conducted in the 1940s to develop synthetic plant hormones that could regulate plant metabolism. Commercial use of these substances by the agricultural industry began in 1946 and rapidly expanded due to their effectiveness. Agent Orange is a 1:1 mixture of two of these synthesized plant hormones: 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) and 2,4-dichlorophenoxyacetic acid (2,4-D). The pure chemicals used in Agent Orange are relatively safe;

however, a contaminant of the 2,4,5-T production process is TCDD, better, but imprecisely, known as dioxin, which is a highly toxic substance—1/1000 of a gram (1 milligram) of TCDD can kill a guinea pig. In a steady state, the estimated half-life of dioxin (the time needed to reduce the level by 50%) is 7.5 years, although in humans this is not absolute and varies based on starting dose, body composition, age, and sex. Human studies have shown this to be in a range of 1 to 10 years. TCDD causes reproductive problems and cancer in test animals.

Use of Agent Orange by the Military

The military use of chemical defoliants was not a new concept as the United States had experimented with its use at the end of World War II. The decision for the use of herbicides in the Vietnam conflict was made by President John F. Kennedy on November 30, 1961. Initially, the only international condemnation of its use came from Radio Moscow, Radio Hanoi, and Radio Peking. In 1961, the U.S. Air Force began Operation Ranch Hand using C-123 aircraft rigged with spray devices (later designated UC-123). Agent Orange was stored in 55-gallon drums clearly marked with a distinct orange strip for easy identification. The contents of the drums were transferred to the tanks on the aircraft and the empty 55-gallon drums, including any residual liquid, were highly sought by the local Vietnamese civilians for personal use—water storage, food storage, and utility containers. The demand by ground commanders for defoliation missions escalated, and the number of aircraft assigned to the unit grew from 6 in 1962 to a peak of 25 by 1969. It is estimated that more than 22 million gallons of Agent Orange were dispersed in areas of North Vietnam, South Vietnam, Laos, Cambodia, and Thailand. In addition to the fixed-wing aircraft, boats, helicopters, trucks, and even individual troops were equipped with dispersal systems allowing for controlled application in tight areas. This multifaceted approach to the application of the defoliant led to wide dissemination of Agent Orange.

By 1964, global and domestic reports began to appear questioning the humanitarian and ecological consequences of the continued use of the herbicides for military operations. The scientific and political queries continued to mount, and by 1969, with the

publication of a report linking the use of 2,4,5-T with birth defects in mice and an unsubstantiated report from South Vietnam of similar problems in human offspring, the future use of Agent Orange was becoming highly controversial. Due to mounting political pressure in the United States and the adoption of chemical and biological weapons ban by the United Nations, the Nixon administration curtailed the use of herbicides in Southeast Asia beginning in 1969. The Department of Defense placed a temporary ban on the use of Agent Orange in April 1970. The inventory from Southeast Asia was stored at Johnston Atoll (approximately 1.37 million gallons); the stateside inventory was stored at the U.S. Naval Construction Battalion Base in Gulfport, Mississippi (approximately 0.85 million gallons). In 1977, the U.S. Air Force destroyed the remaining supplies of Agent Orange in one large operation at sea (Operation PACER HO) using an incinerator ship (M/T *Vulcanus*) that was outfitted with monitoring equipment. This took place in a predesignated burn zone approximately 120 miles west of Johnston Atoll in the Pacific Ocean (latitudes 15°45' to 17°45' N and longitudes 171°30' to 173°30' W) under the strict guidelines, supervision, and regulation of the U.S. Environmental Protection Agency. The operation was finished on September 4, 1977.

Research and Lawsuits

Research conducted in the 1970s and 1980s continued to report no significant difference in the health of veterans exposed to Agent Orange in Vietnam and a matched sample of the general population. The Department of Veterans Affairs (VA) did not recognize exposure to Agent Orange as a cause of disease. However, those studies were inherently flawed due to the fact that the general population in the United States had been similarly exposed to 2,4,5-T and the dioxin TCDD as it was present in many commercial herbicides used by the agriculture industry in the United States since 1946.

The original research studies performed during the development of the phenoxy herbicides became available for public review only after litigation began against the companies that supplied the raw chemicals to both the agricultural industry and the military. A class action suit was filed

in 1979 representing 2.4 million Vietnam veterans and ended with a controversial out-of-court settlement in 1984 for the amount of \$180 million. Only about 50,000 veterans received any compensation from the fund, which ran out of money in 1994. Once the scientific data were reviewed, it became apparent that some maladies produced by TCDD could take 20 to 30 years to surface. Many individual lawsuits had been litigated and denied by citing the 1984 case settlement. However, an appeal of an affirmative ruling in a case against Dow Chemical in which a veteran (Stephenson) developed multiple myeloma in 1998—well after exposure to Agent Orange in Vietnam—made its way to the Supreme Court and was upheld (*Dow Chemical v. Stephenson*). This ruling allowed for representation of those veterans unrightfully excluded from the 1979 class action suit. The resulting individual law suits led to an expanding body of research findings that supported the fact that the dioxin TCDD does indeed cause health issues. The 102nd Congress passed the Agent Orange Act of 1991, which tasked the secretary of veterans affairs to obtain independent scientific review of the available scientific evidence regarding associations between diseases and exposure to dioxin and other chemical compounds in herbicides at least every 2 years for a period of 10 years (subsequently extended until 2014). The National Academy of Sciences, Institute of Medicine's initial report *Veterans and Agent Orange: Health Effects of Herbicides Used in Vietnam* (VAO) was released to the VA in 1994, and updates have been presented every 2 years. Based on these findings, the VA has recognized many diseases as having a causal relationship to exposure to Agent Orange: If a veteran can show exposure history and has one of the diseases, the veteran is eligible for VA medical care and benefits. In a recent ruling from the VA, female military personnel exposed to Agent Orange who have given birth to offspring with certain birth defects can get benefits for the offspring.

Currently, there are lawsuits pending against the chemical manufacturers that seek damages for Vietnamese civilians exposed to TCDD in the form of Agent Orange. Many of the same maladies noted in the Vietnam veterans are seen in Vietnamese directly exposed to TCDD, as well as their progeny. Birth defects seem to occur at an alarming rate in the exposed populations of Vietnam. It is yet to be seen

if the chemical companies will be held accountable for these damages.

AIR FORCE, DEPARTMENT OF

The Department of the Air Force is separately organized under its own secretary as one of three military departments that functions under the authority, direction, and control of the secretary of defense. The Department of the Air Force is responsible for organizing, training, and equipping armed forces responsible for aerial, space, and cyber warfare. This entry discusses the history, responsibilities, roles, and recent leaders of the Department of the Air Force.

Historical Origins

After the remarkable contribution of the Army Air Forces to the victory in World War II, the long-term effort to gain autonomy for the air arm and coequal status with the army and the navy came to fruition. On July 26, 1947, President Harry S. Truman signed the National Security Act of 1947, Public Law 253, which provided a comprehensive program for the security of the United States. The act established the

U.S. Air Force as an independent service, and it also confirmed the integration of defense organizations and civilian control over the military through a unified National Military Establishment.

That same day, President Truman also signed an executive order affirming the roles and responsibilities of the armed services. According to Executive Order 8977, Section IV, the specific functions of the U.S. Air Force are to organize, train, and equip air forces for air operations, including joint operations; gain and maintain general air supremacy; establish local air superiority; provide the strategic air force of the United States and strategic air reconnaissance; and offer airlift, air transport, and support for airborne operations and land and naval forces.

Through a series of transfer orders, the functions assigned to the commanding general, Army Air Forces were reassigned to the Department of the Air Force. In September 1947, Chief Justice Fred M. Vinson swore in W. Stuart Symington as the first secretary of the air force, and General Carl A. Spaatz became the first chief of staff. On September 26, 1947, by order of Secretary of Defense James Forrestal (Transfer Order 1), the lineage and assets of the Army Air Forces were transferred from the War Department.

The service chiefs met in March 1948 in Key West, Florida, to clarify the division of aviation assets. The resulting Key West Agreement determined that the primary function of the U.S. Air Force was strategic air warfare. The navy would support antisubmarine warfare, the protection of shipping, and mine-laying from the air, while the army would retain some air reconnaissance and medical evacuation air missions.

The National Security Act Amendments of 1949, Public Law 216, renamed the National Military Establishment the Department of Defense and expanded the authority of the secretary of defense at the expense of the service secretaries. The service secretaries lost executive branch status and their seats on the National Security Council; they became instead military departments within the Department of Defense. Thus, the secretary of the air force lost direct access to the president as well as influence within the Department of Defense.

On September 19, 1951, Congress passed the Air Force Organization Act of 1951, Public Law 150, and completed the process of creating an independent air arm with a much more detailed organizational structure. The act reaffirmed the civilian

authority of the secretary of the air force to administer the department while establishing the command authority of the chief of staff.

During the 1950s, the Department of Defense went through a period of centralization, culminating with the Reorganization Plan No. 6 of June 30, 1953, and the Department of Defense Reorganization Act of 1958. The secretary of defense took greater civilian authority over the services with the intention of fostering greater cooperation between them. The Joint Chiefs of Staff took command authority over several U.S. Air Force major commands, Strategic Air Command, Air Defense Command, and over-seas commands.

Legal Provisions

The secretary of the air force and chief of staff retained their responsibilities “to organize, train, and equip” combat air forces. U.S. Code, Title 10, chapter 803, the law that defines the Department of the Air Force, has changed little since the 1950s: “The Department of the Air Force is separately organized under the Secretary of the Air Force. It operates under the authority, direction, and control of the Secretary of Defense” (10 U.S.C. § 8011).

By law, the secretary of the air force is responsible to the secretary of defense for the functioning and efficiency of the Department of the Air Force; the formulation of policies and programs that are consistent with national security objectives; the effective implementation of policy, program, and budget decisions and instructions of the president or the secretary of defense; the fulfillment of current and future operational requirements of the unified and specified combatant commands; the effective cooperation and coordination between the Department of the Air Force and the other military departments and agencies of the Department of Defense; and the effective supervision and control of the intelligence activities of the Department of the Air Force (10 U.S.C. § 8011).

The Air Staff is the executive part of the Department of the Air Force, under the authority of the secretary of the air force. Its roles include assisting in the execution of any power, duty, or function of the secretary or the chief of staff; investigating and reporting on the efficiency of the air force; preparing detailed instructions for the execution of approved plans and supervising the execution of those plans;

and coordinating the action of organizations within the air force (10 U.S.C. § 8032).

The chief of staff of the air force, with the grade of general, is appointed for a period of 4 years by the president and serves at the pleasure of the president. The chief of staff acts under the authority, direction, and control of the secretary of the air force. The chief of staff presides over the Air Staff, transmits plans and recommendations of the Air Staff to the secretary, implements plans as the agent of the secretary, and exercises supervision over members and organizations of the air force. As a member of the Joint Chiefs of Staff, the chief of staff keeps the secretary of the air force fully informed of significant military operations affecting the duties and responsibilities of the secretary (10 U.S.C. § 8033).

Strategic Roles

Despite the loss of executive branch status and an automatic place on the National Security Council in the 1950s, the Department of the Air Force continued to play a major role in defense strategy and to receive considerable budgets from the Department of Defense. Owing to its robust technological investments, the U.S. Air Force developed ballistic missiles during the 1950s. The U.S. Air Force thus maintained land-based missiles and bombers—two elements of the “Triad” of strategic weapons; the navy had the third—submarine-launched missiles. This ensured the U.S. Air Force a leading role in strategic defense. By the end of the 1960s, more than 1,000 intercontinental missiles were in place, resulting in the reduction of the long-range bomber fleet.

Tactical capabilities also gained new significance under President John F. Kennedy and Secretary of Defense Robert McNamara during the early 1960s, as they sought to enhance conventional forces that could respond to several protracted conflicts while maintaining strategic nuclear deterrence. This initiated a cultural shift in the Department of the Air Force when the fighter pilots involved in tactical air support for theater commands during the Korean and Vietnam wars gained leadership positions within the U.S. Air Force.

Owing to the Reorganization Act of 1958, the Department of the Air Force, like other services, faced constraints in Southeast Asia, particularly the proscribed targeting and restrictive rules of engagement by a network of political leaders, national defense authorities, and theater commanders. Air

operations were directed by varying agencies during the conflict, not all of which appreciated the capabilities of air combat and the increasing value of air power’s flexibility. In the late 1970s, the U.S. Air Force focused its energy on modernizing, upgrading strategic deterrence, and maintaining readiness in Europe.

In the 1980s, extensive efforts to modernize U.S. Air Force strategic forces continued with the B-1B bomber program, air-launched cruise missiles, peacekeeper missiles, and stealth aircraft. The air force played a leading role as the Department of Defense increasingly pursued space assets, including the Strategic Defense Initiative.

In the early 1990s, U.S. military strategic planners no longer focused on Cold War adversaries. The U.S. Air Force itself confronted the evolving use of air power during the Persian Gulf War, the deeper correlation between air and space power, the declining significance of the nuclear deterrence mission, and the increasing focus on cyber security.

Organization

In 2010, the principal civilian assistants within the secretariat were the assistant secretary for acquisition; the assistant secretary for manpower and reserve affairs; the assistant secretary for installations, environment, and logistics; and the assistant secretary for financial management and comptroller. The Office of the Secretary of the Air Force also included the administrative assistant; the auditor general; the general counsel; the inspector general; the deputy under secretary of the air force, international affairs; the director of public affairs; the legislative liaison director; the director of the office of small business programs; and the chief of information dominance and chief information officer.

Other key members of the Air Staff were the vice chief of staff, the assistant vice chief of staff, and the chief master sergeant of the air force. The chief of staff had deputy chiefs of staff for manpower, personnel, and services; intelligence, surveillance, and reconnaissance; operations, plans, and requirements; logistics, installations, and mission support; and strategic plans and programs. The Air Staff also included the director for studies and analyses, assessments and lessons learned; the assistant chief of staff for strategic deterrence and nuclear integration; the chief of chaplains; the air force historian; the judge advocate general; the chief of the Air Force Reserve;

the chief of safety; the surgeon general; the chief scientist; the director of test and evaluation; the chief of the National Guard Bureau; and the director of the Air National Guard.

Recent Leaders

General Ronald R. Fogleman, chief of staff of the air force (1994–1997), and General Michael E. Ryan, chief of staff of the air force (1997–2001), sought to implement a new strategic planning system to introduce new and joint capabilities in the face of budget cuts and the realities of the post–Cold War world. At the forefront was the integration of air and space systems to advance warfighting capabilities, new concepts of operations, and new technologies in aerospace. In particular, they explored and refined concepts of operations and logistics associated with the deployment and employment of aerospace expeditionary forces for exercises and contingencies. By the end of the 1990s, the Total Force Concept matured as the means to integrate the Air National Guard and the Air Force Reserve more closely with the active force.

Following the events of September 11, 2001, Secretary of the Air Force James G. Roche (2001–2005) and Chief of Staff of the Air Force General John P. Jumper (2001–2005) engaged a number of fronts, from contingency operations in Iraq and Afghanistan, to humanitarian missions around the globe, to homeland defense. They promoted concepts of operations, air expeditionary forces, force development, and close air support with new precision weapons and reconnaissance capabilities, such as JDAMs (Joint Direct Attack Munitions) and the Predator.

Secretary of the Air Force Michael W. Wynne (2005–2008) and Chief of Staff of the Air Force General T. Michael Moseley (2005–2008) focused their efforts on waging the Global War on Terrorism, developing and caring for airmen, and recapitalizing and modernizing the U.S. Air Force. Secretary Wynne brought new attention to the use of renewable energy, while General Moseley underscored the U.S. Air Force missions of global vigilance, reach, and power. According to Moseley (2007),

Global vigilance is the persistent, world-wide capability to keep an unblinking eye on any entity—to provide warning on capabilities and intentions, as well as identify needs and opportunities; *global*

reach is the ability to move, supply, or position assets—with unrivaled velocity and precision—anywhere on the planet; *global power* is the ability to hold at risk or strike any target, anywhere in the world, and project swift, decisive, precise effects.

Secretary of the Air Force Michael B. Donley (2008–) and Chief of Staff of the Air Force General Norton A. Schwartz (2008–2012) announced a “back to basics” approach in 2008, promoting accountability in the nuclear enterprise, support for joint operations, care for airmen and their families, modernization of inventories, and the rebuilding of the acquisition workforce. Indicative of an enduring commitment to defend the nation, they reaffirmed that the mission of the U.S. Air Force was to fly, fight, and win . . . in air, space, and cyberspace.

AIR FORCE, U.S.

In August 2010, the U.S. Air Force had a total force strength of 693,285. This included 336,317 in active duty (265,297 enlisted, 66,447 officers, 4,573 U.S. Air Force Academy cadets); 107,985 in the Air National Guard; 70,052 in the Air Force Reserve; and 178,931 civilians. The U.S. Air Force was a global force in 263 locations around the world, with nearly 30,000 deployed airmen providing key capabilities in direct support of combat operations. In Fiscal Year 2010, the U.S. Air Force total aircraft inventory was 5,493, with 1.37 million flying hours. The U.S. Air Force oversaw 83 major installations and 81 minor installations around the globe. In 2010, the air force was a part of an interoperable and interdependent force in the nation's defense, supporting joint, interagency, and coalition partners. This entry provides an overview of the U.S. Air Force, from its origins with the Wright brothers and the U.S. Army Signal Corps to recent operations in the Global War on Terrorism.

Historical Overview

The U.S. Air Force has its roots in the early 20th-century technology. In January 1905, Wilbur and Orville Wright sent an offer to the War Department to provide the government with a heavier-than-air flying machine, a technology that had not yet proven viable. The War Department turned down the offer, but the Wright brothers' persistence and continued technological innovation demonstrated the military utility and expediency of the aircraft. In 1908, the newly established Aeronautical Division of the U.S. Army Signal Corps ordered a dirigible balloon, similar to the Zeppelin, and issued specifications for an airplane that the Wright brothers built in 1909. Congress voted the first appropriation for military aviation in 1911, while the U.S. Navy started its own program. Although early aviators rejected a proposal to separate their service from the Signal Corps, the issue of autonomy of the air arm would persist.

The U.S. Army deployed its only aviation squadron to the Mexican border to support its field

operations during the Mexican Punitive Expedition of 1916, but it was not until U.S. entry into World War I that American military aviation made a breakthrough, assigning specific roles to aircraft as reconnaissance, fighter, or bomber. Great battles ensued between the “knights of the air” as every army sought control of the air. A doctrine of air warfare began to emerge as air forces began to perform different roles: “strategic” air operations directed at vital war industries and civilian morale and “tactical” operations against ground forces.

When the Aviation Section of the Signal Corps struggled to meet the increasing demands of wartime production in May 1918, the War Department created an Air Service consisting of two agencies: one civilian to control aircraft and engine manufacturing and one military to train and organize units. In the last months of the war, the American Expeditionary Force's Air Service, led by Major General Mason M. Patrick, Brigadier General William “Billy” Mitchell, and Brigadier General Benjamin D. Foulois, made a major contribution to the Allied victory.

Appreciating the important role of air power in the war, a movement developed during the 1920s and 1930s to create an independent air force. The Royal Air Force, which consolidated its army and navy air arms in April 1918, provided the model. U.S. Army leaders, however, perceived the airplane as a weapon for supporting the infantry and gave the Air Service a status comparable to field artillery, cavalry, or engineering. Despite the many commissions set up to study air organization, ultimately changing the name to the Air Corps in 1926, aviators sought more authority within the U.S. Army.

General Mitchell, who was court-martialed for maligning senior U.S. Army and U.S. Navy leadership, argued that an independent air force was imperative to support strategic and long-range bombing. A combat air force, named GHQ Air Force, was created in 1935. It operated under the command of an aviator and reported to the chief of staff of the army or General Headquarters during times of war.

American air power went through a radical transformation during World War II after U.S. observers witnessed the dominant role of aerial warfare during the Spanish Civil War from 1936 to 1939 and during the Battle of Britain in 1940. On June 20, 1941, the GHQ Air Force became Air Force Combat Command, Army Air Forces (AAF), under

the leadership of Major General Henry H. Arnold. In March 1942, General Arnold became commanding general, AAF, directly under the chief of staff of the army, General George C. Marshall. Arnold and Marshall soon agreed that the AAF would enjoy autonomy within the War Department until the end of the war. In July 1943, General Marshall issued War Department Field Manual (FM) 100-20, *Command and Employment of Air Power*, which recognized the coequality of air and land power. Two years later, his successor, General of the Army Dwight D. Eisenhower, was one of the strongest proponents of air force independence. He remarked after the D-Day invasions in Normandy, "If I didn't have air supremacy, I wouldn't be here." The AAF secured that air supremacy during the war.

During World War II, air power became preeminent in warfare, and the AAF became the world's most powerful air force, expanding from 20,000 men and 2,400 planes in 1939 to 2.4 million personnel and 80,000 aircraft in 1944. The Air War Plans Division, Plan 1, the seminal war plan for the air assault on Germany in 1941, provided a strategic blueprint for victory and a foundation for later air force doctrine. The AAF employed combined bombing campaigns, expanded global air transport, and oversaw the massive industrial effort to build a modern air force. The U.S. Strategic Bombing Survey after the war demonstrated the effectiveness of the U.S. air campaign, and it empowered AAF leaders in postwar debates over armed forces unification and national strategy.

On July 26, 1947, the National Security Act of 1947, Public Law 253, established coequal land, sea, and air services and created the Department of the Air Force. Specific U.S. Air Force functions included air operations, gaining general air supremacy, establishing local air superiority, being responsible for the strategic air force and strategic air reconnaissance, and providing airlift and support of airborne operations, air support to land and naval forces, and air transport other than that offered by the U.S. Navy.

As the United States came to rely on a strategy of nuclear deterrence after the war, the air force gave highest priority to its long-range atomic bombing force, using air refueling to lengthen its reach. Strategic Air Command (SAC) became the centerpiece of air force planning, and SAC's role remained predominant throughout the Cold War, especially during the service of Curtis E. LeMay as

its commander (1948–1957). The first important intervention of the air force in the Cold War, however, was by the U.S. Air Forces in Europe during the Berlin Airlift of 1948–1949.

During the conflict in Korea (1950–1953), U.S. Air Force tactical capabilities were increased to support UN forces. With the armistice in Korea, however, President Dwight D. Eisenhower called for a "New Look" at national defense that promoted greater reliance on nuclear weapons and strategic air power to deter war. The U.S. Air Force reliance on SAC bombers to prevent nuclear devastation justified the organization's motto: Peace Is Our Profession.

U.S. Air Force research and development efforts during the 1950s led to the introduction of ballistic missiles, and SAC began to augment its bomber fleet with intercontinental ballistic missiles in 1959. By the end of the 1960s, the air force deployed more than a thousand intercontinental ballistic missiles. Besides ballistic missiles, the air force became involved with satellites and, in 1961, began supporting the National Reconnaissance Office, an independent, covert agency that managed intelligence satellites.

In the 1960s, as a result of Secretary of Defense Robert S. McNamara's emphasis on "flexible response" in the strategy of deterrence, Tactical Air Command enjoyed a revival. Conventional capabilities were quickly tested when the U.S. commitment to Vietnam increased and a tactical air campaign provided support to U.S. and Vietnamese ground forces. Tactical forces in Vietnam and Thailand took part in strikes at crucial targets in North Vietnam and along supply trails in southern Laos. The U.S. Air Force also supported counterinsurgency operations of the Laotian government.

With the end of the fighting and the return of budget limitations, the U.S. Air Force focused on upgrading the strategic deterrent force and maintaining combat readiness during the 1970s. Greater attention was also given to humanitarian support and global commitments with the Military Airlift Command.

Presidents Jimmy Carter and Ronald W. Reagan increased defense appropriations as the U.S. Air Force surpassed 600,000 active-duty personnel during the mid-1980s. Force deployments in support of operations in Grenada (1983), Libya (1986), and Panama (1989) reflected a growing capacity for quick responses to local crises.

At the same time, successful arms control negotiations with the Soviet Union began to ease the pressure of strategic deterrence. Until 1989, the U.S. Air Force's existence as an independent service had coincided with the Cold War. With the collapse of the Soviet Union in 1991, the U.S. Air Force reduced nuclear forces on strategic alert as the number of small conflicts began to emerge around the world. In 1992, the resources of SAC, Tactical Air Command, and Military Airlift Command were sent to the new Air Combat Command and Air Mobility Command to meet the new strategic environment. This was part of an effort articulated by Secretary of the Air Force Donald Rice (1990), with "an increased emphasis on force projection capabilities—even more flexible, rapidly responding, precise, lethal forces with global reach" (p. 3).

The most successful intervention by the U.S. Air Force in these local conflicts was in the Persian Gulf in 1991. Supporting a coalition designed to expel Iraqi forces from Kuwait, the U.S. Air Force led the way in a 6-week campaign that was a triumph in the application of air power. Later interventions in Bosnia-Herzegovina (1995) and Yugoslavia (1999) continued to demonstrate the effective combination of high technology with skill and determination to apply force in difficult situations. The U.S. Air Force supported peacekeeping and humanitarian operations around the world, including Somalia (1992–1993), Rwanda (1994), Haiti (1994, 2010), Bosnia-Herzegovina (1995–1996), Kosovo (1996–1998), East Timor (1999), and Japan (2011). Within the United States, the U.S. Air Force provides major support and rescue operations during and after natural disasters, as evident in the civil support mission after Hurricane Katrina in 2005.

Recent Operations

Air power played a decisive role in conflicts during the 1990s. The U.S. Air Force and coalition air forces opened Operation Desert Storm in January 1991 with a concentrated air campaign to achieve air superiority over Iraqi forces within 24 hours, eventually flying more than 90,000 sorties, airlifting 540,000 tons of cargo, and guaranteeing the combat effectiveness of coalition forces in the air and on the ground. Operation Allied Force in Kosovo, Yugoslavia, beginning in March 1999, involved 78 days of air missions against an advanced air defense

system and resulted in no combat losses for U.S. Air Force and North Atlantic Treaty Organization (NATO) air forces. Air operations, a central focus in the joint forces campaign plan, relied on bombing capabilities, air refueling, airlift, reconnaissance, and new precision weapons systems.

Unlike Operation Desert Storm and Operation Allied Force, Operation Enduring Freedom in Afghanistan did not rely on the centrality of air power to achieve its goals of antiterrorist operations, and air superiority was achieved with little resistance. Instead, the U.S. Air Force supported Special Operations Forces and ground forces in counterinsurgency warfare in a variety of ways. Precision air power and close air support provided by the U.S. Air Force supported Special Operations Forces and local allied forces as the Taliban was removed from power. Given the vast distances of sorties to Afghanistan, air refueling gained a particular significance. Military airlift also played a key role in supporting humanitarian relief operations and delivering materiel by air to Afghanistan. In addition, remotely piloted aircraft, or unmanned aerial vehicles, gained a new value in aerial combat by providing both reconnaissance and offensive weapon system capabilities.

Although the U.S. Air Force had carried out operations over Iraq since 1990, the return to major combat operations during Operation Iraqi Freedom in 2003 presented another challenge in unconventional conflict. Air superiority allowed the employment of precision-guided munitions in support of joint forces on the ground through interdiction and close air support. These precision weapons allowed each sortie to engage multiple targets, placing fewer airmen in harm's way and preventing collateral damage. The U.S. Air Force led an integrated air component effort to provide increased communication and coordination between the joint forces and rapid opportunities for response. The U.S. Air Force also employed non-lethal measures during Operation Iraqi Freedom, dropping thousands of leaflets to encourage enemy combatants to accept a peaceful resolution.

Since the events of September 11, 2001, the U.S. Air Force has maintained round-the-clock operations as part of Operation Noble Eagle, an enduring air defense mission above the nation's cities, critical infrastructure, and special events, to protect North America from another aerial terrorist attack. These combat air patrols reflect an important shift in aerospace defense from shielding against long-range

missile or bomber threats from abroad to providing air sovereignty against unconventional domestic threats.

Transformation and Innovation

Throughout its history, the U.S. Air Force has emphasized scientific and technological planning. In the late 1930s, General Arnold supported the work of Theodore von Kármán, a professor of aeronautics who worked on jet propulsion, through the Air Corps Jet Propulsion Research Project. This project evolved into the Jet Propulsion Laboratory, a major contributor to research on space flight, supersonic flight, and rocketry. In 1944, General Arnold invited von Karman to appraise the future of air power in the United States. His work with a group of U.S. scientists resulted in the 11-volume collection, *Toward New Horizons*, which advocated an active research program for the U.S. Air Force and outlined future developments, such as high-speed aerodynamics, aircraft and high-temperature materials, automatic flight controls, new power sources, liquid fuel rockets, guided missiles, and the “pilotless” aircraft. In the late 1950s, the U.S. Air Force supported the development of high-altitude deep-penetration strategic bombers that could evade interceptors. And the arrival of effective surface-to-air missiles, intercontinental ballistic missiles, and space capabilities ushered in a new era. The U.S. Air Force’s interest in technological innovation remained active in the 1990s with low-observable “stealth” technology and remotely piloted aircraft. In the 2000s, the U.S. Air Force expanded its coordination and interoperability with other services to confront new anti-access/area denial strategies and capabilities. Through a commitment to science, technology, engineering, and mathematics education, the air force continued to translate technology into operational capability.

Like technological innovation, the U.S. Air Force was a leader in racial and gender integration in the U.S. military. When the first African American military aviators in combat, the Tuskegee Airmen of the 322d Fighter Group, returned to the United States after the Second World War, they returned to racially segregated units. But in a few short years, the air force would integrate entirely and serve as a model for the other services. Following the direction of President Harry S. Truman, General Carl A. Spaatz announced that air force units would desegregate to

increase combat effectiveness and improve efficient utilization of manpower in April 1948. Secretary of the Air Force W. Stuart Symington submitted an integration plan in December 1948, and the secretary of defense approved it on May 11, 1949.

Women Airforce Service Pilots, civilian female pilots employed to fly military aircraft during the Second World War, forged a path for women in the military. On June 12, 1948, President Truman signed the Women’s Armed Services Integration Act, which enabled women to serve as permanent members of the armed services. Previously, women could only serve in the military in wartime. In July 1948, the Women in the Air Force program began to train women to take part in ground, medical, and support roles and continued until 1976, when women were accepted into the military on the same basis as men. On April 28, 1993, General Merrill A. McPeak announced that women could become fighter pilots and fighter pilot instructors based solely on merit and performance. And, by Operation Enduring Freedom and Operation Iraqi Freedom, women began to fly regular combat operations. Colonel Jeannie M. Leavitt became the first commander of a combat fighter wing in May 2012.

To address the increased tempo of contingency operations around the world after 2001, the U.S. Air Force began to streamline its operational and command structure. Air force leadership introduced Total Force Integration in 2003 to leverage the resources and strengths of active-duty, National Guard, and Reserve airmen to improve access to aircraft, encourage retention, and increase total force effectiveness. In the 2010s, attention focused on maintaining a ready, agile, and deployable force despite new budgetary challenges by maximizing efficiencies and focusing on core capabilities: recapitalizing tanker, fighter, and bomber aircraft; modernizing satellite constellations; and confronting the cyber domain.

Mission and Ethos

The current mission of the U.S. Air Force is to *fly, fight and win . . .* in air, space and cyberspace. The U.S. Air Force is a key contributor to national strategic defense through joint conventional and irregular warfare, air transport, humanitarian relief operations, and deterrence and dissuasion of potential adversaries. The Cold War task to detect, deter,

dissuade, and defeat has gradually evolved into a new mantra of global vigilance, global reach, and global power that reflects the unique responsibilities of the air component of the U.S. armed services as the only force not limited by geographic barriers.

Global vigilance is the ability to gain and maintain awareness anywhere in the world; to provide warning and to determine intent, opportunity, capability, or vulnerability; and to fuse this information with data received from other services or agencies and use and share relevant information with the Joint Force Commander. *Global reach* is the ability to project military capability responsively, with unrivaled velocity and precision, to any point on or above the earth and to provide mobility to rapidly supply, position, or reposition joint forces. *Global power* is the ability to hold at risk or strike any target anywhere in the world, to assert national sovereignty, to safeguard joint freedom of action, and to achieve swift, decisive, precise effects related to U.S. Air Force alignment with joint and national priorities.

The U.S. Air Force has three core competencies: (1) developing airmen, (2) bringing technology to the defense portfolio (warfighting), and (3) integrating operations. These core competencies enable the six distinctive capabilities of the U.S. Air Force: (1) air and space superiority, (2) global attack, (3) rapid global mobility, (4) precision engagement, (5) information superiority, and (6) agile combat support. The U.S. Air Force bases these core competencies and distinctive capabilities on a shared commitment to three core values: (1) *integrity first*, (2) *service before self*, and (3) *excellence in all we do*. These are the standards to which every airman is held accountable.

In April 2007, General T. Michael Moseley, chief of staff of the U.S. Air Force, introduced the “Airman’s Creed” to invigorate the warrior ethos of the air force. This ethos is the “warfighting-focused culture, conviction, character, ethic, mindset, spirit and soul” fostered in training airmen. It underlines the current mission of the U.S. Air Force to “*fly, fight, and win*” and to take pride in the heritage of the “American Airman.”

In February 2010, Michael B. Donley, secretary of the air force, and General Norton A. Schwartz, chief of staff of the air force, emphasized the unique capabilities of the U.S. Air Force to succeed in current conflicts while countering future threats to national security in their *Fiscal Year 2011 Air Force Posture*

Statement. In particular, they planned future development of the U.S. Air Force based on its 12 core functions: (1) nuclear deterrence operations; (2) air superiority; (3) space superiority; (4) cyberspace superiority; (5) global precision attack; (6) rapid global mobility; (7) special operations; (8) global integrated intelligence, surveillance, and reconnaissance; (9) command and control; (10) personnel recovery; (11) building partnerships; and (12) agile combat support. These core functions described the range of U.S. Air Force capabilities while identifying the growing interdependence of U.S. military services to sustain freedom of action and ability to project power in the 2010s.

AIR FORCE COMMAND

Major commands (MAJCOMs) are a major subdivision of the U.S. Air Force and are directly subordinate to Headquarters U.S. Air Force, serving under the chief of staff. This entry examines the history of MAJCOMs and describes the 10 MAJCOMs active today.

History

At the establishment of the U.S. Air Force in 1947, 14 MAJCOMs were initially organized. Although these commands would soon be rearranged and their overall number would change, this organizational form provided a foundation for the air force.

The Air Force Organization Act of 1951 provided the statutory framework for the internal organization of the U.S. Air Force, codifying organizational and management policies. Three major air commands—(1) the Air Defense Command (ADC), (2) Strategic Air Command (SAC), and (3) Tactical Air Command (TAC)—were specifically recognized. The legislation prohibited the alteration and consolidation of these commands without congressional action except during times of war or national emergency. Other commands could be created or dissolved through the actions of the secretary of the U.S. Air Force, in consultation with the chief of staff of the U.S. Air Force.

Throughout the Cold War, SAC was the centerpiece of air force planning. SAC led the nuclear deterrence mission, managing land-based strategic bombers and intercontinental ballistic missiles, strategic reconnaissance and command post aircraft, and air refueling for SAC assets.

ADC, Military Airlift Command (MAC), and TAC were also important. ADC organized the air defense of the United States, developing a series of continental radar systems to monitor Soviet threats, culminating with the North American Aerospace Defense Command. ADC's role declined with the increased responsibilities of the Air Force Reserve and Air National Guard, which took over the air

defense role during the 1970s. MAC organized strategic airlift capabilities, succeeding the Military Air Transport Service—which had served as a joint command with the U.S. Navy—in 1966. MAC played a particularly important role in supporting the wars in Southeast Asia. TAC delivered major tactical air support for theater commands during the Korean and Vietnam wars. TAC leadership thus gained status within the U.S. Air Force, leading to the “rise of the fighter generals” in the 1980s and shifting the balance of power from SAC to TAC.

In the early 1990s, efforts to streamline the budget and command structure resulted in a major reorganization. MAC, SAC, and TAC were deactivated in 1992. SAC's bombers and TAC's fighters were unified into a single offensive air command, the Air Combat Command (ACC). To reduce duplication and to promote rapid force deployment, senior leadership deactivated MAC and created the Air Mobility Command. In addition, Air Force Systems Command and Air Force Logistics Command were deactivated, their functions subsumed within the new Air Force Materiel Command.

The Contemporary Period

As of 2010, 10 MAJCOMs exist, reflecting the core priorities of the U.S. Air Force:

ACC, headquartered at Langley AFB, Virginia, was established on June 1, 1992, as the primary force provider of combat air power. ACC operates fighter, bomber, reconnaissance, battle management, and electronic combat aircraft. It also provides command, control, communications, and intelligence systems, and conducts global information operations that ensure strategic air defense forces are ready to meet the challenges of peacetime air sovereignty and wartime air defense. ACC includes the First, Ninth, and Twelfth Air Forces and the U.S. Air Force Warfare Center. The command operates 15 major bases. The ACC commander is the air component commander for Joint Forces Command.

Air Education and Training Command, headquartered at Randolph AFB, Texas, was redesignated on July 1, 1993, from Air Training Command to train and prepare airmen for mission readiness. AETC commands the Second and Nineteenth Air Forces and Air University.

Air Force Global Strike Command, headquartered at Barksdale AFB, Louisiana, was established

on August 7, 2009, to develop and provide combat-ready forces for nuclear deterrence and global strike operations. It unified the bombers previously with ACC and the intercontinental ballistic missiles from Air Force Space Command. This newest command oversees two numbered air forces, three ICBM wings, two B-52 Stratofortress wings, and a B-2 Spirit wing. The Air Force Global Strike Command's commander is the air component commander for U.S. Strategic Command.

AFMC, headquartered at Wright-Patterson AFB, Ohio, was established July 1, 1992, to deliver war-winning expeditionary capabilities through technology, acquisition, testing, and sustainment. AFMC oversees the Air Force Research Laboratory, the Aeronautical Systems Center, the Air Armament Center, the Electronic Systems Center, three test centers, five sustainment centers, and two specialized units, including the National Museum of the U.S. Air Force.

Air Force Reserve Command, headquartered at Robins AFB, Georgia, was established February 17, 1997. It includes the Fourth, Tenth, and Twenty-Second Air Forces, and it ensures that units are trained and equipped with the necessary logistical support to maintain operational readiness.

Air Force Space Command, headquartered at Peterson AFB, Colorado, was established September 1, 1982. It provides an integrated system of space and cyberspace capabilities to support the mission of precision strike, global awareness, and data connectivity for the U.S. military. The Fourteenth Air Force, Twenty-Fourth Air Force, Space and Missile Systems Center, Air Force Network Integration Center, and Air Force Frequency Management Agency are assigned to Air Force Space Command.

Air Force Special Operations Command, headquartered at Hurlburt Field, Florida, was established on May 22, 1990. It provides forces for global deployment and support of regional commands in four core areas: (1) forward presence and engagement, (2) information operations, (3) precision employment and strike, and (4) special operations forces mobility. Air Force Special Operations Command is a component of U.S. Special Operations Command.

Air Mobility Command, headquartered at Scott AFB, Illinois, was established June 1, 1992, to support global air mobility through airlift and aerial refueling and to supply humanitarian assistance at

home and abroad. The Eighteenth Air Force is the only numbered air force in Air Mobility Command.

Pacific Air Forces, headquartered at Hickam AFB, Hawaii, was established July 1, 1957. PACAF offers integrated expeditionary air capabilities to Pacific Command to promote peace and stability in the Asia-Pacific region. The Fifth, Seventh, Eleventh, and Thirteenth Air Forces constitute Pacific Air Forces, with geographic missions including Alaska, Korea, and Japan.

U.S. Air Forces in Europe, headquartered at Ramstein AB, Germany, was established on August 7, 1945. The oldest of the existing MAJCOMs, it is the air component of the U.S. European Command. U.S. Air Forces in Europe provides forward-based air power, supports the North Atlantic Treaty Organization and coalition partners, and affirms U.S. commitment to Europe.

AIR FORCE ONE

With the exception of the White House, Air Force One is the most visible representation of the American presidency. It is the aircraft dedicated to transporting the president anywhere in the world at any time. Technically, Air Force One is the air traffic

President Barack Obama is seen at a meeting with his staff, April 5, 2009, aboard Air Force One on a flight from Prague, Czech Republic, en route to Ankara, Turkey.

Source: Official White House photo by Pete Souza.

control call sign given to any U.S. Air Force plane transporting the president. When the president travels on non-air force aircraft, a call sign following the same naming convention such as Army One, Navy One, or Marine One is used. However, the moniker “Air Force One” most commonly refers to the two identical customized Boeing 747 airplanes, designated as SAM 28000 and SAM 29000 (Special Air Mission). The air force technical classification for these planes is VC-25A. These planes are managed and operated by the Presidential Airlift Group under the 89th Airlift Wing at Andrews Air Force Base in Maryland and are part of the White House Military Office. This entry briefly reviews the history of Air Force One and then describes features of the current aircraft.

Presidential Air Travel, 1940s–1980s

Franklin D. Roosevelt was the first president to fly while in office. His first trip, in January 1943, was to the Allied conference in Casablanca. Roosevelt’s decision to fly highlighted the still prominent U-boat threat. He took a Boeing 314 flying boat across the Atlantic and then a C-54 Skymaster military

transport to Casablanca. Shortly thereafter, a modified C-54 Skymaster was acquired for use as a presidential aircraft. This aircraft, nicknamed the “Sacred Cow,” could transport 15 passengers, had a conference room, and featured a built-in elevator in the center of the plane to accommodate easy access for Roosevelt’s wheelchair. In 1947 a DC-6 was commissioned for President Harry S. Truman; it was nicknamed the “Independence” after Truman’s hometown in Missouri. This plane accommodated 24 passengers, had autopilot, and technically advanced navigation and communications systems, which included a radio teletype machine. In 1954, President Dwight D. Eisenhower was the recipient of two new Lockheed Constellation C-121A airplanes, named *Columbine II* and *Columbine III*.

Presidential air travel moved into the jet age in October 1962 with the arrival of a custom Boeing 707 with the air force classification VC-137C. This plane, designated SAM 26000, served as the primary Air Force One for 10 years. Prior to Richard Nixon taking office, SAM 26000 was completely refurbished and upgraded to include the latest in security and communications equipment. This marked the

Douglas VC-54C "Sacred Cow" at the National Museum of the U. S. Air Force.

Source: U.S. Air Force photo.

transition from presidential airplane to an airborne version of the White House capable of serving as a mobile command center. In 1972, another VC-137C (SAM 27000) entered service and became the primary Air Force One until it was replaced by SAM 28000 and SAM 29000 in 1990.

Modern Aircraft

Today's SAM 28000 and SAM 29000, with air force classification VC-25A, are highly customized aircraft built on a 747 airframe. These planes are equipped with four General Electric CF6-80C2B1 jet engines capable of flying the president at the nearly supersonic speed of 630 miles per hour. They are 231 feet long and 63 feet high and have a 195-foot wingspan. They can cruise at a height of 45,000 feet in the air. They have a range of 7,800 miles, but they are also equipped to do aerial refueling to provide a nearly limitless range. Each plane is divided into three levels; lower deck (cargo and equipment), main deck (passengers), and top deck (crew and communication). The front part of the main deck features a presidential suite complete with

two beds, a shower, a presidential office, and medical room. The middle section contains a conference/dining room and offices for junior and senior staff. The rear section is for guests, security, support crew, and the press. The top deck houses the communication center, crew lounge, and flight deck. There are 87 telephones on board (both secure and nonsecure), fax machines, 19 televisions connected to a satellite transmission, and broadband Internet. Additionally, there are two galleys that serve the president and guests. The plane is staffed by 26 crew members segmented into five groups: flight crew, engineering, communications, cabin crew, and plane security. In addition to the crew, the plane can accommodate 76 passengers.

Security is of the utmost importance for Air Force One. Few details about Air Force One security are ever discussed or confirmed. Yet there are certain details that have emerged over the years. Air Force One contains an array of radio and radar-jamming equipment, sensors to detect attacks, electronic countermeasures, and deployable flares to thwart heat-seeking missiles. All the plane's wiring is covered in heavy shielding to protect against an electromagnetic

pulse stemming from a nuclear explosion. The airplane fuel is guarded and analyzed before being put into the plane. To prevent tampering, food for the plane is purchased by stewards in plainclothes from a variety of markets around Washington, D.C. To minimize exposure, Air Force One is always cleared for immediate takeoff and landing. When traveling internationally, Air Force One will have a fighter escort if the threat level is high. Domestically, Air Force One does not travel with a fighter escort due to cost and air traffic congestion. The exception was 9/11, when fighters provided an escort back to Washington.

The modern Air Force One was conceived and designed to be the airborne global command center for the president in case of nuclear war or a similar catastrophic event; until September 11, 2001, that premise had never been tested. The 9/11 terrorist attacks brought to light several flaws that prevented Air Force One from operating as a true global command center. Perhaps the most glaring problem was that the president had no way of addressing the nation. As a result, Air Force One had to leave the safety of the sky to land at Barksdale Air Force Base to allow President George W. Bush to tape his national address ("Freedom itself was attacked this morning"). Another significant problem was that Air Force One had only voice lines at the time of the attack, with no ability for video conferencing. Yet another major flaw was a lack of coordination between those on Air Force One and those on the ground. For example, leaders on the ground were executing crisis management plans but not always in real-time coordination with the president and his advisors on the plane.

The Future of Air Force One

As the presidency changes so too must Air Force One. SAM 28000 and SAM 29000 are reaching their effective limits. The air force is currently planning the next version of Air Force One. It is seeking to bring three new planes online in 2017, 2019, and 2021, respectively. Based on the events of 9/11 and the spectrum of emerging threats these new planes will be built with more security, communications, and other technological advances. Yet the objective will remain the same: to ensure that the president can travel safely and securely anywhere at any time

and while executing any and all duties at 40,000 feet in the air.

AIR MOBILITY COMMAND

Air Mobility Command (AMC) is the successor organization to the U.S. Air Force's (USAF) Military Airlift Command. This entry reviews the development of AMC and describes types of missions and aircraft.

Following the demise of the Soviet Union, the USAF conducted a wholesale restructuring of its various commands and organizations. During the Cold War, much of the USAF's warfighting potential rested in the Strategic Air Command, the Tactical Air Command, and Military Airlift Command. In 1992, the USAF reorganized these three commands into two: AMC and Air Combat Command. In this move, AMC received the majority of tanker and transport aircraft, while Air Combat Command received most of the fighters and bombers.

According to the May 2010 edition of *Air Force Magazine*, AMC's mission is to "provide rapid, global mobility and sustainment through tactical and strategic airlift and aerial refueling for U.S. armed forces." In this mission, AMC contains the bulk of the U.S. military's cargo and tanker aircraft assets. AMC provides airlift to all branches of the Department of Defense and other federal agencies and regularly supports the United Nations and the efforts of the international humanitarian community. In its assigned mission, AMC is tasked with

three functions: air mobility support, aerial refueling, and airlift. Not only does AMC provide the assets to move people and equipment, but it also manages, controls, and schedules airlift missions globally.

Functions of AMC

In its most visible role, AMC conducts airlift missions that support the full range of military operations at the strategic, operational, and tactical levels of war. Supporting these operations, AMC performs passenger and cargo movement, special air missions, aeromedical evacuation, and support to special operations forces. In conducting airlift missions, AMC operates a number of different aircraft, including the C-5 Galaxy, KC-10 Extender, C-17 Globemaster, KC-135 Stratotanker, and C-130 Hercules. The larger C-5 and C-17 aircraft are usually employed for strategic, intertheater airlift, while the KC-10 and KC-135 normally accomplish aerial refueling tasks. The smaller C-130s are largely used for intratheater and tactical level lift. While these assets provide the lion's share of lift capacity, the command also operates many smaller airframes like the C-9, C-20, C-21, C-32, C-37, and C-40 in operational support roles. These smaller aircraft are used for aeromedical evacuation, passenger movement, and executive transport. Furthermore, AMC is responsible for the two VC-25 aircraft known as Air Force One to support presidential functions.

Headquartered at Scott Air Force Base, Illinois, the command consists of both military and civilian personnel and numbers more than 130,000. AMC is composed of the 18th Air Force, 16 air wings, two airlift groups, and other specialized units and leverages active-duty USAF personnel as well as the Air Force Reserve and the Air National Guard. In addition, the command also utilizes the commercial airline capabilities of the Civil Reserve Air Fleet (CRAF). CRAF is an important element of AMC as it contracts civilian commercial aircraft and personnel to support AMC missions. This unique capability allows commercial aircraft to fly missions that exceed AMC's organic lift capability. With this capacity, AMC usually tasks CRAF with passenger movement to maximize the cargo lift capacity of military aircraft.

In its task to provide air mobility support, AMC conducts command and control functions for airlift operations, while also providing aerial port services,

aircraft maintenance, weather forecasting, and crash fire and rescue capabilities. AMC centrally manages all its global airlift missions from Scott Air Force Base in the Tanker Airlift Control Center. The Tanker Airlift Control Center provides real-time, in-transit visibility of AMC missions and aircraft. In addition to the centralized control, AMC also deploys teams to various theaters to help manage aircraft and airspace operations in forward areas. Due to its global mission, AMC often operates airfields in foreign countries while helping host nations manage and control their own airspace, facilities, and air traffic. In this function, AMC personnel often conduct airfield embarkation/debarkation services, enroute traffic control, and tower functions, and in many instances improve airfield facilities through construction projects.

In a unique role, AMC provides aerial refueling support globally and in all theaters of operations by use of the KC-10 and KC-135 aircraft. Given the worldwide scope of U.S. missions, aerial refueling allows aircraft to fly nonstop, while expediting the delivery of supplies or extending the range of various aircraft. In a tactical function, aerial refueling also allows fighter and attack aircraft to loiter over the battlefield longer while in support of combat operations. In this mission, AMC provides refueling support to all branches of the U.S. military and its allies. Currently, the USAF is looking to replace the fleet of aging KC-135s with the next generation of aerial refueling aircraft and at present has designated the project as "KC-X."

Supporting operations in Iraq and Afghanistan, AMC is one of the busiest organizations in the air force. In providing airlift support for both Operation Iraqi Freedom and Operation Enduring Freedom, by 2006 AMC moved 6.4 million passengers and delivered 3.9 million tons of fuel. As a result, AMC's movement totals surpassed those of the Berlin Airlift, making the ongoing operation the largest and longest airlift operation in history. As these operations and the Global War on Terrorism continue, AMC's airlift totals have, and will continue, to rise.

In addition to its military missions, AMC provides yeoman service to the international humanitarian community by providing airlift to peacekeeping and disaster relief operations. In the post-Cold War world, humanitarian operations have become a mainstay of AMC's functions. These include support for efforts in Rwanda, Bosnia, Somalia, Nepal,

Uganda, Belarus, and Tanzania, to name only a few. In recent years, AMC provided support for tsunami relief operations in 2004–2005, Pakistan earthquake and flood relief in 2009–2010, and Haiti earthquake relief in 2010. AMC also provides airlift and support for domestic emergencies like Hurricanes Katrina (2005), Andrew (1992), and Marilyn (1995), as well as flood relief in North Dakota (1997) and after the bombing of the Alfred P. Murrah Federal Building in Oklahoma City (1995).

AMC in the Future

AMC will continue to be an important element of American national power as it provides global reach in support of the national security strategy. Ongoing operations in Iraq and Afghanistan, as well as support for the Global War on Terrorism, will task AMC assets on a regular basis. Furthermore, in the foreseeable future, AMC will continue to support humanitarian and peacekeeping missions throughout the globe. As a result, AMC and the services it provides will remain an important element in America's discourse with the international global community.

AIR NATIONAL GUARD

Since September 1947, the Air National Guard (ANG) has been a reserve component of the U.S. Air Force. It was organized, trained, and equipped as a strategic reserve force. However, the ANG has evolved over its 60-plus-year history as an operational reserve force, operating on a daily basis with the active-duty air force in wartime and real-world steady-state operations. The ANG has more

than 107,000 members, about 21% of the total air force (Guard, Reserve, and active duty). Of all the missions in the air force, the ANG has 30% of the fighter, 30% of the airlift, and 35% of the air refueling missions. The ANG also performs 32% of command and control, 15% of rescues, and 13% of the command executive transport mission, as well as 5% of intelligence, surveillance, and reconnaissance and 5% of special operations. Since 1947, the ANG's combat capability and operations tempo continue to increase. This entry traces the development of the ANG to the present and discusses its missions and roles.

Background

The ANG's heritage predates 1947. Between the organization of the first National Guard observation squadron in 1916 and World War II, 29 observation squadrons were activated. These 29 units became the core of the aviation heritage of the new ANG, and its legacy continued with the 43 flying squadrons added to the ANG roster after 1947. Moreover, the ANG, like its Army National Guard brethren, continues its militia community-based tradition dating from colonial times.

Unlike the Air Force Reserve, the ANG is a dual-role reserve component with federal and state roles. Today, 89 ANG wings and more than 1,000 subordinate units are organized, trained, and equipped for the federal role during wartime conditions, but during peacetime, ANG units are under the control of the 54 governors of the states, territories, and District of Columbia, where they continue to be funded primarily by federal resources. While federal resources continue to support the ANG, in the state role, the ANG supports the governors during domestic emergencies like natural disasters, civil disturbances, various homeland defense missions, and special events.

The ANG received its baptism by fire during the Korean War. Sixty-seven flying squadrons and approximately 45,000 ANG members, or 80% of the force, were mobilized. Some units took 3–6 months to become combat ready, and some never did, but the ANG made a substantial contribution to the war effort. In response to its Korean War experience, senior ANG and air force leaders became seriously committed to building the ANG into an effective reserve component force. The ANG

received modern equipment and funding to create an effective fighting force.

When the 1961 Berlin Crisis occurred, President John F. Kennedy mobilized more than 21,000 ANG members from 28 squadrons. The ANG deployed 216 ANG fighter aircraft with support personnel to Europe to reinforce the North Atlantic Treaty Organization in Operation Stair Step, the largest aircraft deployment in ANG history. The entire deployment across the Atlantic Ocean occurred without the loss of a single plane.

The war in Vietnam stretched the air force's ability to maintain its commitments in Europe. As a result, the ANG assumed aerial refueling responsibilities for air force fighters in Europe from 1967 to 1977 in Operation Creek Party. It demonstrated that the ANG could sustain significant operational rotations overseas in support of the air force without resorting to mobilization. This rotational philosophy, using a volunteer force, remains virtually unchanged today.

With the drawdown of active-duty forces after the Vietnam War, some significant missions moved to the ANG. Air Guard KC-135 air refueling tankers began participating in the Strategic Air Command's nuclear alert force in 1976. In 1977, the ANG became the primary airlifters for U.S. Southern Command's Operation Coronet Oak, which continues today. From 1978 to 1990, rotating ANG fighter squadrons assumed responsibility for the air defense of the Panama Canal Zone (Operation Coronet Cove). The ANG participated in Operation Just Cause, the 1989 invasion of Panama to expel Manuel Noriega, its dictator, and to install a democratically elected president. In the 1990s, Air Guardsmen manned radar stations and flew fighter aircraft in Latin America to monitor and report suspected drug-running aircraft.

Turning Point

ANG fighters, tankers, airlifters, special operations, aeromedical evacuation, and security forces participated in the air campaign of the Persian Gulf War crisis of 1990–1991. During that time, 12,404 ANG members were mobilized and deployed to Southwest Asia, Europe, and other overseas locations, as well as serving in the continental United States.

Following the Persian Gulf War and the end of the Cold War, the ANG continued to operate worldwide as a totally integrated force with the active air

force, the Air Force Reserve, and jointly with all services and North Atlantic Treaty Organization forces. The ANG participated in several major operations involving humanitarian assistance, peacekeeping, and direct combat action. Some operations were extensions of those, like Coronet Oak, that involved the ANG earlier in South America. However, new operations in the 1990s were added to the growing commitment of ANG resources and capability. ANG flying and support units participated in maintaining the no-fly zones over Iraq, provided humanitarian assistance in Somalia and Rwanda, and supported peacekeeping forces in the Balkans and Haiti. Its airlift and tanker forces continued participating in the air force's global mobility operations on a daily basis. In 1997, the ANG assumed responsibility for manning First Air Force, which maintained the air defenses of the continental United States. President Bill Clinton also mobilized 4,870 Air Guardsmen during the Kosovo War in 1999.

The ANG participated in overseas federal missions to help alleviate the growing burden on active-duty air force personnel. For the ANG to meet its overseas commitments with its limited pool of aircraft and personnel, the ANG developed "rainbow" deployment packages consisting of multiple units of like aircraft to train and deploy together. These overseas missions demonstrated that the ANG was a valuable part of an operational total force. Its airlift capabilities, tankers, fighters, and expeditionary combat support units not only filled gaps in the active-duty air force but also deployed as a highly experienced and mature force whose members volunteered for overseas operations. In light of these operations, the ANG continued maintaining a high level of readiness for its state role.

The ANG played a critical role in the immediate U.S. response to the 9/11 terrorist attacks on America and the subsequent global military actions against those aggressors and their supporters. In the immediate aftermath of 9/11, the ANG improvised a greatly strengthened continental air defense system and bore the main burden of sustaining it. The combination of fighter patrols and 24-hour alerts at 26 ANG bases across the United States put heavy stress on the ANG fighter force in both training and readiness. Nevertheless, the wide geographic dispersal of its fighter units and its long-standing participation in the homeland defense mission made the ANG the right organization to execute the mission.

The ANG's aviation and support units also played critical roles in the wars in Afghanistan (Operation Enduring Freedom) and Iraq (Operation Iraqi Freedom). Flying and nonflying ANG units were deployed repeatedly to every operating base supporting those wars. When Operation Enduring Freedom began in October 2001, the ANG participated in the initial combat operations in Afghanistan and continued to participate in the mission. ANG airlift, tankers, A-10 and F-16 units, special operations, rescue, civil engineer, security forces, combat communication, and many other units have repeatedly deployed to the region over the course of that war.

When the United States invaded Iraq in March 2003, the ANG had 18,552 members on active duty who participated in the invasion and served in Afghanistan and other operations worldwide. The six ANG A-10 units participated in combat operations in Iraq and Afghanistan simultaneously.

During the invasion of Iraq, the only A-10 presence in Afghanistan was an ANG A-10 unit. In Operation Iraqi Freedom, the ANG also possessed unique capabilities critical to the war effort. The LITENING II targeting pod fitted to F-16C Block 30 fighters and a select number of A-10 aircraft provided air support for Joint Special Forces units operating in the western desert of Iraq looking for Scud missiles. In addition, ANG F-16C Block 30 aircraft provided a unique tactical reconnaissance capability for the coalition ground commanders in Iraq called Theater Airborne Reconnaissance System. This unique capability added stress to the ANG units' training requirements and preparations for overseas deployments. Intelligence, surveillance, and reconnaissance was also a small but growing capability the ANG deployed to Iraq, namely, in the collection and dissemination process via the remotely piloted aircraft (RPA) systems like the Predator.

Arming under the gaze of instructors, a team of airmen prepare for a convoy live fire exercise during the U.S. Air Force's Desert Defender area security operations course on Fort Bliss, Texas, June 30, 2010. The 6-week course is run by the Texas Air National Guard's 204th Security Forces Squadron. It prepares air force security forces for area security operations in Iraq and Afghanistan. Airmen deploy after graduation.

Besides the ANG deploying people and equipment to the wars in Afghanistan and Iraq, the ANG also performs other critical missions that support civil authorities, such as aerial fire fighting, through the Modular Airborne Fire Fighting System. In addition, one New York ANG C-130 unit provides airlift for the National Science Foundation called Operation Deep Freeze. All three ANG rescue units in Alaska, California, and New York provide critical search and rescue capability in their federal and state roles. In 1992, the ANG took on a new role in counterdrug (CD) operations. They modified 11 Fairchild C-26 Metroliner II aircraft for photo reconnaissance and aerial surveillance and redesignated the RC-26B for the CD mission. The RC-26 was so effective in providing detailed photographs of destruction caused by Hurricane Katrina that now the aircraft are used for combat operations in Southwest Asia. The ANG has performed other missions assisting civil authorities. For example, the first of some 6,000 U.S. Army and Air Guard volunteers began deploying in June 2006 to the U.S. border with Mexico under Operation Jump Start to help stem the flow of illegal migrants into the United States.

The ANG has also provided assistance to civil authorities in countless operations caused by natural and human-made disasters in the United States and abroad. Such missions are carried out using the same federal equipment and capabilities they use for combat. At home, the ANG typically performs such missions under the control of a governor. In a given year, ANG units respond to numerous calls for assistance for flood relief, suppression of forest fires, tornadoes, snow emergencies, hurricanes, civil disturbances, and labor strikes. During the summer of 2005, several hurricanes ravaged the Gulf Coast region of the United States. From August through November 2005, the ANG flew 4,132 airlift sorties in relief efforts for Hurricanes Katrina and Rita, carried 34,639 passengers and 11,496 tons of cargo, evacuated 2,046 patients from the region, and rescued 23,604 endangered people and moved them to local safe havens. In the summer of 2008, the ANG responded on a large scale to Hurricanes Gustav, Hanna, and Ike. In addition, the ANG deployed its Modular Airborne Fire Fighting System capability to Indonesia to fight forest fires and sent C-17s and C-5s to deliver relief aid to nations suffering from earthquakes.

Since the release of the Base Realignment and Closure law in May 2005, the ANG has grappled with significant challenges to its force structure to

meet the air force's critical expeditionary warfighting requirements, growing homeland defense responsibilities, and need to continue assisting civil authorities in dealing with natural disasters, illegal drugs, and terrorist threats. Since Base Realignment and Closure, the number of flying wings in the ANG has declined from 89 to 83. It is expected that many more flying missions will end primarily because of the massive retirement of older fighter, tanker, and airlift aircraft assigned to the ANG, which forced many units to merge into new and often nonflying missions such as cyber, intelligence, or command and control. Other units able to hang on to a flying mission adapted to the changing environment by becoming associate units with the active-duty air force or Air Force Reserve, sharing airplanes, facilities, and other resources.

The ANG as a unique federally funded, dual-role military organization serves the United States with a militia heritage dating back to 1636 and a combat-proven readiness and capability for current real-world overseas and domestic missions. This comes despite the continued reduction of aircraft being built and equally distributed throughout the total air force. Nevertheless, the ANG looks forward to future missions that include a greater portion of nontraditional flying missions.

AIRBORNE UNITS

Airborne units are light infantry forces trained, equipped, and manned to deploy onto the battlefield via vertical insertion under parachute from an

aircraft. As these soldiers are delivered by individual parachute, so too can the immediate equipment of an airborne unit be delivered via paradrop. Large equipment parachutes are attached either to individual pieces of equipment—some can be quite heavy, including vehicles and artillery pieces—or to pallets of equipment such as food, water, ammunition, and other warfighting materiel. This entry discusses the training and leadership qualities of airborne soldiers and U.S. Marines and the procedures for an airborne operation.

The most well-known American airborne unit is the U.S. Army 82nd Airborne Division, though dozens of other smaller units also retain an airborne capability. The U.S. Army has six airborne brigade combat teams (BCTs), each with 3,750 soldiers. While *airborne* is an adjective describing such smaller units and their parachute-qualified forces, “the Airborne” usually means the 82nd.

Training

An American airborne soldier is trained at the U.S. Army base at Fort Benning, Georgia, where U.S. Army trainers, experts, and the managers of the American military’s program for airborne operations conduct the Basic Airborne Course. This 3-week course of basic military parachuting is built to generate large numbers of airborne soldiers each year. The course of instruction culminates in five jumps and is widely known simply as “jump school.”

On graduation from this course, newly trained airborne soldiers or U.S. Marines are authorized to wear the silver basic parachutist badge on their uniforms. Later parachute operations may authorize a member of the U.S. Navy or Marine Corps to wear the gold wings of the Navy-Marine Corps Parachutist badge, while U.S. Army soldiers may later qualify for Senior Parachutist or Master Parachutist badges. U.S. Army soldiers are authorized a star on their jump wings if they have jumped into a confirmed combat zone.

Procedures

An airborne operation is controlled by a jumpmaster inside the aircraft, who is in radio contact with one or more assistant jumpmaster(s) in the aircraft; the pilots, crew chiefs, or loadmasters of the aircraft; the drop zone controller and/or pathfinder (an airborne soldier sent ahead of the rest of the unit to mark drop

or landing zones) experts on the ground; and sometimes the airborne unit commander. The pilot flies a predetermined course above a drop zone, correcting for wind, and indicates to the jumpmaster the precise moment at which jumpers can begin to exit. This signal is often given via a green light inside the aircraft. The jumpmaster then orders the jumpers out.

Large airborne units are inserted via a static-line operation from either a helicopter or a fixed-wing aircraft. A static line is a thick strap of webbing, one per jumper, which at one end is attached to a drogue chute (a small parachute that deploys first) and at the other ends in a snap hook. This hook is fastened to a wire inside the aircraft. As the jumper falls away from the aircraft, his body weight tightens the static line, which in turn pulls out the drogue chute and deploys the full parachute. Parachutes for static-line operations are round or rectangular, with minimal forward airspeed on the round chutes provided by missing panels on one side, which provide for the jumpers to “fly” the parachute as an airfoil to a safe landing.

An airborne unit is generally inserted via static line at low altitudes, usually between 1,250 and 1,750 feet above ground level but sometimes as low as 500 feet above ground level. Such low-level insertion keeps jumpers grouped together in drop zones by preventing winds aloft or jumper mistakes from scattering the hundreds or thousands of jumpers involved in a large airborne operation, and it also minimizes the exposure time of jumpers helpless in the air.

Some airborne units have more highly trained individuals ready to conduct high-altitude parachute insertions. These units, which tend to be smaller, more specialized, and highly selective, include Army Special Forces, Marine Corps Force Reconnaissance, Delta Force, Navy SEAL, and the Army 75th Ranger Regiment. High-altitude, low-opening and high-altitude, high-opening operations, as their names imply, involve jumping from aircraft at high altitudes, often requiring the individual jumper to wear and breathe bottled oxygen. The jumper freefalls, sometimes for thousands of feet, and opens a higher performance parachute via a ripcord at a predesignated altitude to avoid detection and to fly it to a target zone.

Leadership

Airborne units are trained to operate independently and without resupply for several days. Such units can jump in and fight immediately or may be inserted

to take over an airfield for resupply and reinforcing operations via landing large transport aircraft. In the first days of Operation Iraqi Freedom in 2003, for example, members of the 173rd Airborne BCT executed just such a latter operation north of Baghdad.

Small unit leadership is crucial in such operations, and airborne units around the world pride themselves on producing tough and intelligent leaders. This small unit leadership is crucial not only for the airborne insertion itself, with its inherent dangers and requirement for physical bravery, but also for the independent operations to which these units are often assigned. It is important to note that the airborne capability is only one way to place a unit in its tactical position on the battlefield; though a unit may belong to, for instance, the 82nd Airborne, it is likely that it will fight as an infantry force in modern combat.

These units, by their nature and training, are very lightly equipped, and as light infantry, they do not pack the “punch” of a larger or heavier force. They are highly mobile and flexible, however, and on an enormous battlefield like that in Afghanistan, with its severe weather, treacherous mountains, and great distances between units, a force will often fight alone. Airborne units must make use of combined arms—the summoning, terminal guidance, and control of indirect and air-delivered fires as well as their own weapons—to fight unsupported.

In operations in Afghanistan as part of Operation Enduring Freedom, for instance, U.S. Army Airborne soldiers have retained their expertise in parachute operations, but far more often, they are used as light infantry forces spread across a vast, austere battlespace. French airborne forces at Dien Bien Phu in Vietnam in 1954 were cut off and surrounded in a valley, but they fought, often to the death, against a far larger enemy force. The French example is one of exceptional small unit leadership, esprit de corps, and camaraderie.

Perhaps American airborne units’ finest hour and a leadership example is that of the U.S. Army’s 82nd and 101st Airborne’s preinvasion jump into Normandy on the night before the June 6, 1944, Operation Overlord landings, now famous as the D-Day invasion. Hundreds of aircraft were dropping nearly 14,000 jumpers into a relatively small area, and pilots worried about alerting the German antiaircraft defenses as well as deconflicting with one another. Their drop aircraft scattered by altitude,

flak, poor navigation, and bad weather; individuals drifted widely; and units immediately lost integrity and scattered in the dark and behind German lines.

Some men fought for days with other units and officers before finding their own. Though a difficult insertion, the D-Day operation grew into legend in proving the Airborne’s resourceful small unit leadership, in which young officers and noncommissioned officers gathered up ad hoc teams of confused and scared soldiers and without guidance nevertheless executed the missions they had been assigned. This is a hallmark of airborne units: training to be cutoff and alone, lightly armed and supplied, and deep to the rear of enemy forces.

AIRBORNE WARNING AND CONTROL SYSTEM (AWACS) AIRCRAFT

Throughout the history of warfare, military commanders have attempted to give their forces an advantage by minimizing the fog of war. To minimize the fog during modern air combat, air forces and navies throughout the world deploy Airborne Warning and Control System (AWACS) aircraft. These aircraft, converted from either cargo or commercial airliners, employ extremely long-range search radars. This allows highly trained mission specialists to control air operations by identifying hostile aircraft and ground targets and directing aircraft to those targets before they can threaten friendly air and ground operations in theaters around the globe.

This entry traces the development of AWACS aircraft and describes AWACS equipment, capabilities, operations, and crew.

AWACS Aircraft Development

Early Development

The U.S. Navy spearheaded early development of AWACS aircraft during the later stages of World War II. The need for these aircraft became apparent after the navy suffered large fleet losses thanks to Japanese kamikaze raids off Okinawa. Because of these losses, the navy tasked the Massachusetts Institute of Technology with developing a search radar set that could be deployed in an aircraft, thereby extending the range in which the navy could detect incoming enemy air raids. Codenamed Operation Cadillac, the result of this research was the AN/APS-20 search radar. To deploy the AN/APS-20, the navy paired the radar with a modified TBM Avenger torpedo bomber. Crewed by a pilot and a radar operator and known as the “Guppy” (thanks to the bulge on the bottom of the aircraft due to the radar dome), the TBM-3W could detect aircraft up to 100 miles away from the fleet. Following the use of the TBM-3W, the navy turned to the development of a dedicated AWACS aircraft during the postwar period. In the summer of 1945, the navy acquired 23 surplus B-17G heavy bombers. Redesignating them PB-1W, the navy outfitted these aircraft with the AN/APS-20 and crewed the aircraft with fighter directors.

Early Cold War AWACS Advances

Following the PB-1W, the U.S. Navy turned to the EC-121 to fill its need for a dedicated AWACS platform. Based on the Lockheed Super Constellation, the navy procured its first EC-121 Warning Star in 1949. These early models were outfitted with the APS-20 search radar as well as the APS-45 height finding radar. These early models were so successful that by the early 1950s, both the navy and the U.S. Air Force turned the EC-121 into the primary land-based AWACS aircraft of the U.S. military throughout the 1950s and 1960s. In addition, to provide the fleet with a carrier-borne AWACS capability, the navy debuted the E-1 Tracer in 1959. The Tracer, which was a converted Grumman S-2 Tracker antisubmarine warfare aircraft, had a crew of four

and featured the APS-82 air search radar placed in a sloped, saucer-shaped housing on the top of the aircraft. Current Aircraft

The current inventory of U.S. AWACS aircraft is a diverse group of technologically advanced aircraft that gives the United States and its allies an advantage during air operations. For the U.S. Navy, the Grumman E-2 Hawkeye gives the navy an organic AWACS aircraft that is truly the eyes of the fleet (*organic* means that the navy has a capable AWACS platform of its own and does not have to rely on another entity for AWACS coverage). The Hawkeye was first deployed in 1964. At first, the Hawkeye’s main search radar was the APS-96. Through the years, the navy has upgraded the electronics on the Hawkeye, and currently the navy’s E-2C variants are equipped with the APS-145 search radar. This unit is capable of detecting targets at 350 nautical miles and is capable of handling 40 hostile intercepts simultaneously. The APS-145 is also the centerpiece of the detection systems of the E-2D. This variant of the Hawkeye features upgraded avionics and electronics and allows the navy to conduct traditional air detection missions, perform maritime tracking and surveillance, and manage humanitarian relief efforts. The navy plans to deploy the E-2D to the fleet in 2015.

The U.S. Air Force relies on two AWACS aircraft. The primary AWACS platform of the air force is the E-3 Sentry. Developed in the mid-1970s, the E-3 was first deployed in 1978. The E-3 is based on the Boeing 707 and currently features the Grumman AN/APY-2 as its main search radar. This system has a range of more than 250 nautical miles and has the capability to perform various search patterns, including evaluating maritime targets. Finally, for the tracking of ground targets, the air force employs the E-8 Joint Stars. The Boeing 707 is also the basis for the E-8, and the aircraft employs the AN/APY-7 radar to detect ground targets up to 150 miles from the aircraft. There are currently 17 E-8s in the air force inventory, the last of which was delivered to the air force in 2005.

AWACS Crew Positions and Responsibilities

There is no doubt that technology plays a large part in AWACS operations. However, like every other

modern weapons system, the technology is there only to aid the human crew in carrying out their mission. This is especially true for an AWACS crew.

Crew Makeup

AWACS crews vary widely depending on the aircraft and the mission. For instance, the E-2 Hawkeye is crewed by five people. The cabin crew is made up of a pilot and a copilot, while the mission crew consists of a combat information center officer, an air control officer, and a radar operator. Conversely, the crew of the larger E-3 Sentry consists of four flight crew members (pilot, copilot, navigator, and crew chief) and from 13 to 19 mission specialists. These mission specialists are separated into a surveillance and a control section. Each section is manned by three to five specialists and is tasked with a distinct portion of the mission much like their navy counterparts.

Crew Responsibilities

Despite the difference in crew size, the responsibilities of both Hawkeye and Sentry crews are largely the same. During the average mission, the radar operators will interpret the radar picture by separating friendly forces from hostile ones. Then, when hostile forces are detected, either the air control officer or the weapons controller (on the Sentry) will direct friendly aircraft to intercept and engage the enemy air or ground targets.

AWACS Operations

AWACS mission profiles like the one above have been executed by the United States in every major conflict since the Cold War. In the 1950s, EC-121 Warning Stars formed the first line of defense for the United States against the possibility of Soviet bomber attack when the aircraft maintained two distant early-warning radar picket lines. The EC-121 also deployed to Vietnam in the 1960s and early 1970s and was tasked with tracking MiGs of the North Vietnamese Air Force. In the late 1970s and into the 1980s, U.S. Air Force and North Atlantic Treaty Organization (NATO) E-3s turned their attention to once again maintaining surveillance of the Soviet military.

AWACS missions continued after the conclusion of the Cold War. In 1990, during Operation Desert Storm, the U.S. Air Force E-3 force directed more than 120,000 allied sorties and is credited with

helping destroy 38 of 40 Iraqi MiGs. In addition, the E-3 was an integral part of Operation Northern Watch, a combined task force mission to enforce the northern no-fly zone over Iraq following the end of hostilities in the Persian Gulf. Finally, air force Joint Star aircraft detected the retreat and coordinated the destruction of the Iraqi army as it left Kuwait. AWACS aircraft have also found a place in operations in the post-Cold War era. In 1999, U.S. Air Force E-3 units flew 500 missions, where they directed offensive, defensive, and search and rescue air operations as part of NATO operations in Kosovo. In October 2001, NATO E-3 crews conducted operations over the United States following the September 11 attacks on the country. Finally, U.S. AWACS aircraft are an important cog in providing close air support to Allied forces in Iraq and Afghanistan. These operations, as well as those of their predecessors, illustrate that AWACS aircraft have been an important part of military operations since before the Cold War and will continue to be so into the 21st century.

AIRCRAFT, ANTISUBMARINE

Until the 1950s, aviation had little effect in antisubmarine warfare (ASW), as it was next to impossible to spot a submerged submarine from the air. Technology limited air crews to eyesight (later aided by radio direction finders and radar) and experience to detect a submarine either surfaced or snorkeling to transmit radio signals or resupply air and/or stores. It wasn't until sonar was adapted to aviation that aviation earned its true place in ASW. Newer and more affordable submarine designs allow smaller countries and smugglers to expand undersea capabilities, pushing aviation ASW to the forefront. The ASW airframe designs are unique in that they must fly "low and slow" and by a patient pilot. This entry describes the types of missions and aircraft and discusses advances in technology.

ASW Airframes

Prior to the 1920s, basic airships and biplanes adapted into seaplanes, tended at sea by seaplane tenders, were used for ASW. As aviation technology advanced into the 1920s, the first true expansion of naval aviation research began to take shape. Long-range airframes (5,000 kilometers) designed for search and rescue and surface patrol, such as Consolidated PBY Catalina (the United States) and the Short Sunderland (the United Kingdom) "flying boats," were often assigned ASW missions. Throughout both the World Wars, task forces and convoys were the primary targets of submarines. Large numbers of aircraft were necessary to create an effective bubble around these targets. To expand the efficiency and compensate for the limited range of aircraft, convoys employed AVPs, escort—or "jeep"—carriers (CVEs) and capital warships as escorts. These ships provided numbers and various models of standard carrier-borne and small single-engine sea/pontoon planes to range out attempting to be more effective by detecting enemy submarines before they could get too close to the convoy.

During the 1950s and the Cold War, U.S./North Atlantic Treaty Organization (NATO) forces saw the need to expand aviation ASW for task force, coastline, and inland protection against the expansion of a Soviet strategic submarine threat. Advancements in sonar and digital electronics made sonar aircraft deployable, though with some limitation. The towed sonar array required tethering to its host, which created a drag coefficient too great for fixed-wing airframes. The newly developed rotary-wing helicopter, however, could hover and deploy the *dipping sonar* array to 100 meters below the surface with ease and could be easily deployed from helipads on many classes of ships. Popular helicopters still in use are the 1961 Sikorsky SH-3 Sea King (discontinued in the United States), the 1959 Kaman UH-2 Seasprite, the 1978 Agusta Westland Lynx, and the slightly larger 1979 Sikorsky SH-60 Seahawk. These airframes were very efficient in their original aerodynamic design; improvements in range and payload are the result of lighter and stronger structural materials, engine efficiency, and in-flight refueling. In addition, modern light-weight and smaller digital avionics and ASW hardware extended the service life of these older and well-designed airframes, allowing for multiple hard points (attachment or mounting points on any part of the airframe, e.g., under a wing, designed to carry a load) for ASW weapons.

Not having the World War II naval aviation experience of the U.S./NATO forces, Soviet/Russian ASW and political philosophies center on the fast-attack submarine. They do, however, maintain minimal ASW aviation assets and have a string of ASW helicopter designs. Size is a primary concern, so their primary shipborne designs have no tail rotor to allow them to fit into smaller spaces. Soviet/Russian helicopters include the 1958 Kamov 25 "Hormone" and the 1976 Kamov 27 "Helix," which has two top rotors. Today, as economic constraints are being placed on the world's militaries, the use of smaller drone helicopters like the popular DASH QH-50 is providing aviation ASW capabilities to smaller littoral patrol vessels.

As digital radio and its encryption technology advanced, so did sonar with the development of the sonar buoy (sonobuoy). Disposable and free floating, the sonobuoy transmits contact and environmental data to its host and is easily deployed by all airframe types as well as vessels. A deployed array of

several sonobuoys creates a coordinated free-ranging bubble below and around a task force convoy or brackets a target submarine. Originally developed for geologic exploration, magnetic anomaly detection (MAD) systems were being adapted for ASW toward the end of the Second World War. Though very accurate, MAD has limited range but, when coupled with a sonobuoy array, can find a bracketed submarine with pinpoint accuracy. The sonobuoy/MAD package revolutionized ASW and allowed for fixed-wing aircraft to reenter the ASW air fleet.

Short-range escort missions for a task force and/or convoy are primarily assigned to ship-based helicopters, fixed-wing vertical takeoff and landing, or vertical/short takeoff and landing like the Soviet/Russian 1975 Yakovlev Yak-36. Long-range patrols, such as polar ice-pack and coastal patrols, require land-based fixed-wing airframes. Fuel-efficient luxury liner airframes were chosen for their range and payload capacities. These large airframes allow space for multiple missions, expanded bracketing/attack ASW capabilities, and hard points for additional fuel tanks and weaponry. Their only

limitation is the aircrew fatigue common to all patrol aircraft, though land-based crews do fare better. The Russia Ilyushin IL-38 May, the NATO Lockheed P-3 Orion, and the British Aerospace Nimrod are some examples. Worth mentioning is the U.S. Navy's 1974 Lockheed S-3 Viking fixed-wing aircraft; this relatively small aircraft provided at-sea long-range ASW capabilities to U.S./NATO forces for three decades. It was replaced in 2009 by the more economical yet equally capable latest model SH-60, ending at-sea fixed-wing ASW for the U.S. Navy.

Information Technology

As can be imagined, the data packages created by the number of deployed ASW aviation, surface, and subsurface assets can be overwhelming. To coordinate the data and asset efficiency, each ASW aircraft is equipped with the Light Airborne Multipurpose System (LAMPS) integration computer. Used primarily by the U.S./NATO navy, it is an integral part of the anti-aircraft Aegis Combat System. LAMPS coordinates all linked ASW data from an area of

An air-to-air right-side view of an Air Antisubmarine Squadron (VS-31) S-3A Viking aircraft with an ASQ-81 magnetic anomaly detection probe extending from the tail section. The aircraft is assigned to the nuclear-powered aircraft carrier USS *Dwight D. Eisenhower* (CVN-69).

operation and oceanographic-satellite and Sound Surveillance System reports from fleet command centers to generate targeting solutions for associated weapons assets.

The all-inclusive protection package focuses on a mission-dependent primary asset (coastline, convoy, cruiser, aircraft carrier, etc.) and coordinates surface, subsurface, and aviation units that range miles around the primary asset forming a protective bubble. The range and speed of aircraft to deploy a bracket is ASW's greatest asset. When an enemy submarine is detected in the bubble, the ranging LAMPS will dispatch aviation and other assets to the area. Once pinpointed, LAMPS then notifies and coordinates appropriate surface and subsurface assets to the area to rein the target into a "killing zone." On identification as an enemy, appropriate weapons are deployed to dispatch the target.

The capabilities of modern submarines encouraged navies to expand efforts in ASW weapon technology. The primary aviation ASW weapon at the time of this printing is the *aerial torpedo*. A single conventional warhead from any aerial torpedo or bomb/mine is not likely to sink a modern double-hulled submarine. The expectation is to cause enough damage to disrupt the mission until a surface vessel or submarine can dispatch the target with multiple warheads. Although a tactical nuclear warhead could sink a modern submarine, the Strategic Arms Limitation Talks agreements of the 1970s require them to be counted in a country's total nuclear arsenal, and therefore, they have for the most part been discontinued.

ASW aerial torpedoes, such as the smart and lightweight (between 600 and 800 pounds) Mark-46 (U.S./NATO), are under constant technological improvement. These torpedoes have computer-controlled active/passive acoustic guidance and countermeasure resistance; speeds are in excess of 40 knots, and ranges, though classified, can exceed 8,000 meters. The warhead is 100 pounds of poly-bonded high explosive. The target search signature and arming protocols are remotely preprogrammed by LAMPS into its guidance computer prior to entering the water. Deployment can be either by simply dropping them from any aircraft or by launching them from a separate delivery system, such as the antisubmarine rocket from a surface vessel. The *rising mine* such as the CAPTOR (encapsulated torpedo) has been discontinued by the United States

due to its poor performance; however, it remains in use by other navies. Deployed by an aircraft or vessel, it is a sonar-activated encapsulated torpedo. It is placed on the sea bottom as part of an array of several units, establishing a "kill zone." When activated by a passing submarine with the appropriate sound signature, it sheds its skin and is acoustically guided to the target as a torpedo. The premise is that several torpedoes of the array may be launched at a single submarine causing enough damage to sink it.

Modern ASW

Today, the design of ASW airframe architecture is at a relative standstill. Airframe design efforts are primarily focused on lighter and stronger construction materials and engine performance. The primary advancements are in ASW instrumentation technology, refining deployment and detection capabilities for aviation and surface and subsurface vessels. ASW is a team effort; all ASW assets must work together to stay ahead of submarine stealth technology. China, Russia, and many Third World navies are evolving away from the stand-alone ASW concept to a coordinated systems approach as both submarine and ASW technologies enter the free market, which includes an emphasis on significant high-tech aviation components making ASW more dependent on aircraft and their capabilities.

AIRCRAFT, ATTACK

Attack aircraft fulfill two primary roles. Their first role is air interdiction, disrupting the enemy's military capabilities before they can be brought to bear against the Allied forces. Their second role is the destruction of enemy ground units, whether independently or in support of allied ground units. In the modern world, there are few specialized attack aircraft. Most fighters can, if necessary, also provide ground support. It is easier to view aircraft as

platforms designed to deploy the weapons they are armed with. Most modern fighters contain the technology and versatility to deploy cannons and missiles against other aerial targets and cannons, bombs, mines, and air-to-surface missiles against ground targets. The primary difference between an attack aircraft and a bomber is the fact that bombers have longer range capabilities, can carry a larger payload of bombs, and lack the potential to deploy antiair weaponry. Fighters designed solely for aerial superiority are designed with speed and maneuverability in mind, lacking the durability and ruggedness necessary for ground assault. This entry provides a history of attack aircraft, their development and current uses, types of aircraft, and weapons used.

Attack Aircraft During the Two World Wars

World War I saw the birth of aircraft of all roles, with attack aircraft being used to target enemy trenches with machine guns or tanks and artillery with small bombs. Attack aircraft during this period relied primarily on speed as their means of defense. The small engines and limited understanding of aircraft design meant that light materials had to be used for the planes to perform, limiting survivability. Though they proved to be effective in combat, a large number were lost to antiaircraft and small arms fire.

Following the end of the First World War, the Allied Powers turned to the bomber as the primary weapon, giving attack aircraft a minor berth. The start of the Second World War saw the Allies entirely unprepared for the German mechanized army, supported by the large attack aircraft wing of the Luftwaffe. German attack aircraft, especially the Ju-87 Stuka dive bomber, supported the advancing army, destroying enemy fortifications and troop concentrations. Entering a near-vertical dive, the Stukas attacked with great accuracy while at the same time frightening nearby enemies with their Jericho Trumpets—sirens attached to their landing gear.

The Allies rediscovered attack aircraft entirely by accident. During the war, a number of interceptor and escort fighters began to strafe German positions to spend the remaining ammunition before returning home. Adding small bombs to fighters to further harass the German armed forces resulted in the creation of fighter-bombers, the Allied version of attack aircraft. Fighter-bombers were used to great effect before the D-Day landings, striking bridges, rail

lines, and airfields and occasionally providing close air support (CAS). At this stage, CAS was a secondary objective; targeting the enemy's logistical lines proved to be far more effective. The Western Allies' primary attack aircraft, the P-47 Thunderbolt, like its predecessors, relied on speed for survival. The Soviet Union, however, used a different approach. Its ground attack fighter, the Il-2 Shturmovik, was significantly slower than its contemporaries as a result of its heavy armament and armor. Armed with 20-mm cannon and thick armor plating, the Shturmovik was able to target enemy armor and was virtually immune to small arms fire.

During the war, attack aircraft were found to have some serious drawbacks. Designed primarily for ground attack, they lacked maneuverability or speed, necessitating a fighter escort to defend them. The Germans discovered this limitation of the Stuka during the Battle of Britain, while the former Soviet Union recouped losses through industry and sheer force of numbers. For the Allied fighter-bombers, survivability was less of an issue as the fighter-bombers were able to engage fighters if necessary, but their lighter construction made them less effective in the ground attack role.

Attack Aircraft During the Cold War Era

Following the Second World War, focus shifted to the newly developed intercontinental bombers and the use of nuclear weapons. A Tactical Air Command was established in the United States as a requirement of the establishment of the U.S. Air Force as a separate service, though this branch found itself largely ignored in favor of the nuclear bombers of Strategic Air Command. The limited effectiveness of ground attack fighters in the Korean War led credence to the argument that strategic bombers would be the only effective force in the postwar period. Laborers in North Korea negated the effects of attacks on the logistics lines by repairing rail lines and bridges with great speed. Similarly, a lack of adequate airfields in South Korea required the fighters to deploy from Japan, which, with limited intelligence, limited their ability to provide CAS. Following the Korean War, development of attack aircraft languished.

The Vietnam War allowed the air force to learn, yet again, the necessity of dedicated ground attack aircraft. The F-105, a single-strike nuclear fighter adapted to the ground attack role, was thin-skinned and poorly designed for this new purpose. Lacking

armor, redundant systems, and self-sealing fuel tanks, it was never designed to sustain ground fire. The F-4 Phantom, which replaced it, provided better survivability but was also not meant for ground attack. A large number of attack aircraft were lost to enemy anti-aircraft fire and surface-to-air missiles.

The Vietnam War saw the advent of the side-firing gunship. A plane circling a set point could accurately lay fire on a target for a period of time. C-47 transport aircraft were modified to carry three 7.62-mm miniguns and given the new designation AC-47 (for attack). The effectiveness of this design was rapidly noted in attacks on convoys, and the designs were further adapted. The C-130, a larger transport plane, was quickly adapted to this role. Given its size and the ability to carry larger weapons, it proved to be more flexible. Containing night vision technology and infrared, variations of the AC-130 contained larger 20- and 40-mm cannons, with some containing 105-mm artillery guns.

The Vietnam War also saw the beginning of the use of precision-guided munitions (PGMs). Laser-guided munitions were quickly found to be far more effective in targeting structures, such as bridges, and now granted the ability to attack targets in delicate areas, such as towns. Though laser guidance systems could not be used during periods of cloud cover or fog, they were able to increase bomb accuracy to within meters of the target. The lack of major conflicts during the late 1970s and 1980s allowed for the development of new technology for attack aircraft. The F-117 Nighthawk stealth fighter-bomber was a classic example. Utilizing stealth technology, night vision sensors, and laser targeting, it was able to deploy two laser-guided bombs with extreme precision. F-15Es and F-16s were upgraded to use Low Altitude Navigation and Targeting Infrared for Night pods, giving fighters the ability to operate at night. Coupled with the joint surveillance target attack radar system, which allowed for the surveillance and tracking of ground vehicles and aircraft, attack aircraft were now able to identify targets and destroy them with precision.

Attack Aircraft After the Cold War Period

These new technologies would be demonstrated during Operation Desert Storm, the Persian Gulf War (1991). Concentrated attacks on the Iraqi air defenses resulted in air superiority, allowing attack aircraft to

act with virtual impunity. The air force was then able to focus on Iraqi ground forces and their supply lines. Bridges were targeted and destroyed, reducing the Iraqis' ability to deploy and sustain their forces. Also, since tanks disperse heat at a slower rate than the desert sands, they were easy to identify at night, providing visible targets to planes equipped with infrared equipment. During the sustained air attack campaign that preceded the ground operation, Iraqi forces lost 1,400 tanks and 2,000 armored vehicles and artillery pieces. Compared with the air campaigns of the past, this was an unprecedented change.

Desert Storm also saw the deployment of the A-10 Thunderbolt II, colloquially known as the "Warthog." True to its name, it is an unattractive plane but perfectly suited for ground attack. In a design that emphasizes survival, the pilot sits in a titanium tub, with multiple redundancy systems and two engines strategically placed to muffle the heat signature. The plane saw great usage in Operation Desert Storm, using its 30-mm Gatling gun and guided antitank missiles against enemy tanks, troops, and fortifications. The design of the plane is such that it would still be capable of returning from a battlefield with a single engine running and having lost half of a wing.

Attack aircraft played a similar role in the North Atlantic Treaty Organization peacekeeping operation in Kosovo, Operation Allied Force, targeting the military forces and infrastructure of Slobodan Milosevic's regime, which was persecuting the Kosovo Albanians. This operation also saw the first use of Joint Direct Attack Munitions. A guidance package that is attached to unguided bombs to turn them into PGMs, Joint Direct Attack Munitions uses Global Positioning System tracking to strike its target in any weather and is accurate to within 10 meters.

Attack Aircraft in the 21st Century

Attack aircraft play a prominent role in the North Atlantic Treaty Organization peacekeeping operation in Afghanistan, as they did during the now completed Operation Iraqi Freedom in Iraq and Operation Unified Protector in Libya. Though the aircraft worked to cut their supply lines, they were more readily utilized for CAS missions, assisting soldiers by targeting enemy units directly. This capability is made possible by the use of intelligence, through the use of reconnaissance planes, satellite tracking, unmanned

aerial vehicles, or other sources. The ability to refuel planes in flight reduces any limitations of range and allows aircraft to remain on station for large periods of time, limited solely by vehicular endurance. However, in unconventional conflicts, such as those in Iraq and Afghanistan, it is difficult for planes to operate in areas where there is a large civilian presence. The risk of friendly fire incidents is high, and given the potential accuracy of the weapons involved, collateral damage is difficult to justify. Civilians are not forgiving of intelligence or mechanical faults.

At the moment, the A-10 and the AC-130 are the only dedicated attack aircraft in service in the U.S. Air Force. However, any aerial platform that can be equipped with ground attack weapons—air-to-ground missiles, guided or unguided bombs, and cannons—can be an attack aircraft. In the modern world, it is easier to think of planes as platforms, with their equipment and mission objectives determining the role that they play. To this end, the entire fleet of the U.S. Air Force can be considered attack aircraft. The U.S. next-generation fighter, the F-35 Lightning, is expected to be a multirole fighter, being able to take on the role of air superiority and ground attack with equal effectiveness. Other Western attack aircraft include the Royal Air Force Tornado and its replacement, the Eurofighter Typhoon. Russian attack aircraft include the Su-25 Frogfoot, the Su-27 Flanker, and the MiG-29.

Attack aircraft have come a long way from the fragile trench strafers of World War I and the fighter-bombers of the Second World War. Armed with cannons and PGMs, attack aircraft play an important role in weakening the enemy before they are engaged by friendly forces. With modern wars favoring unconventional guerrilla conflicts, attack aircraft excel at targeting mobile targets rapidly, often from ranges where the aircraft itself cannot be seen or heard. At the moment, the majority of attack aircraft are manned, with the split-second decision making of targeting left to a pilot or gunner. However, a growing number of unmanned aerial vehicles are assuming the attack role. Initially deployed as reconnaissance vehicles, many have been armed with precision missiles for the purpose of attack roles and are beginning to play a more prominent role in modern warfare. These platforms are likely to become even more commonplace in the current state of economic turmoil; they provide similar effects as attack aircraft but with a significantly

smaller budget. Similarly, it is more difficult to justify the use of bombers in unconventional wars where the enemy does not have major bases and cities to be targeted. Future platforms, such as the F-35, are designed to play multiple roles as such high costs for a specialized craft are no longer sustainable.

AIRCRAFT, Bomber

Bombers are aircraft designed to attack land and/or sea targets by dropping gravity bombs or by launching air-to-ground missiles. Few military innovations have influenced the character of modern warfare as much as the bomber. Bomber aircraft have played a highly significant role in beginning, waging, winning, and preventing modern wars since their introduction in the earliest days of powered flight, and they continue to affect nearly every level of human conflict today. This entry discusses the history of bomber aircraft and early bomber advocates and the roles and strategic uses of bombers by the U.S. military from the early 20th century to the present.

Early Development

While the actual development of bomber aircraft occurred through a gradual process of experimentation, the idea of the bomber far predated the Wright brothers' first powered flight in December 1903. As early as 1847, the bombing of Vera Cruz from

hot air balloons was proposed during the Mexican-American War, and in 1849, the Austrian forces tried unsuccessfully to attack Venice with unmanned balloons loaded with explosives. In 1892, the French War Ministry contracted with the French aviation pioneer Clement Ader to develop a powered aircraft that could carry 75 kilograms of explosive instead of a second man and fly over a specific point. While the Wright brothers awaited the patent for their first aircraft in 1906, Captain William "Billy" Mitchell was lecturing on the uses of balloons and dirigibles for aerial bombardment at the U.S. Army Signal School at Fort Leavenworth, Kansas. Over time, advances in aviation technology gradually made these early visions for aerial bombing a practical reality.

While early military aircraft were seen primarily as a battlefield surveillance asset to support ground forces, early aircrews quickly saw possibilities for autonomous aerial attacks—many of the first "bombs" delivered from aircraft were improvised weapons like bricks and handheld grenades. The first documented aerial bombing was conducted on November 1, 1911, by an Italian pilot flying a surveillance mission against Turkish troops in Libya, the same year a crude mechanical bombsight was designed for U.S. Army Wright Flyer aircraft.

Bombers in World War I

Faced with the massive carnage of static trench warfare, World War I military leaders increasingly looked to bomber aircraft to return decisive mobility to the battlefield. German forces combined bomber attacks with targeted infiltrations of specially trained infantry troops using the *Sturmtruppen* (stormtrooper) tactics that would mature to become the Blitzkrieg tactics of World War II. In 1918, Colonel William "Billy" Mitchell designed a massive 1,400+ aircraft attack, including 414 bombers, against the St. Mihiel salient. The same year, Colonel Edgar Gorrell proposed "strategical bombardment" attacks against German key industrial targets, but the armistice came before they could be executed. By the end of the war, both sides had developed aircraft specifically for the purposes of aerial attack, and the era of the bomber began.

The Interwar Years

The period between World Wars I and II was one of dramatic innovation for bomber aircraft.

As the range, durability, power, and speed of aircraft improved, it became more and more feasible to propose long-range bombing missions far behind enemy front lines. Air power theorists like the Italian General Giulio Douhet proposed that future wars would be decided by “battleplane” bombers attacking enemy airbases and cities. Mitchell argued that bomber aircraft would make armies and navies obsolete, and he sought to prove his point by sinking the captured German battleship *Ostfriesland* and several obsolete U.S. battleships with Martin MB-2 bomber aircraft in a series of highly public demonstrations.

Mitchell’s advocacy for the preeminence of air power, and the need for an independent air service, was so strident and harsh that he alienated both critics and many would-be supporters. He resigned from the service after his court-martial in 1926, but not before his ideas had permeated the defense community.

Despite Mitchell’s controversial rhetoric, in 1924 the softer spoken Major General Mason Patrick was able to gain approval for General Headquarters Air Force, a wartime organization within the U.S. Army dedicated to using bomber aircraft as strategic weapons instead of solely as ground support assets. In subsequent years, the U.S. Air Corps Tactical School developed a doctrine designed to defeat enemies through direct air attacks against their critical war infrastructure. This doctrine also led to the development of highly specialized, multiengine, long-range bombers designed to fly at high speeds and altitudes, further separating the large “strategic” bomber from smaller “tactical” fighters (built primarily to shoot down other airplanes) and pursuit aircraft (aircraft with both fighter and ground attack capabilities). The development of heavy bombers like the B-17 Flying Fortress, B-24 Liberator, and B-25 Mitchell would later prove vital to Allied bombing efforts in World War II.

Mitchell’s *Ostfriesland* demonstration also left an indelible imprint on the U.S. Navy. Recognizing the potential of seaborne bomber aircraft, the U.S. Navy developed seaborne dive bombers and torpedo bombers specifically designed to attack enemy ships and developed aircraft carriers to launch and recover them.

World War II

Perhaps no war has been influenced as heavily by bomber action than was World War II. From the Stuka dive bombers attacking Polish troops in September 1939, through the atomic bomb attacks

on Hiroshima and Nagasaki in August 1945, bombers played significant roles in most of the decisive events of the war. The combination of long-range bombers and nuclear weapons both hastened the end of the war and set the conditions for the Cold War to come.

The close coordination between bomber and ground attacks in the Blitzkrieg attacks against Poland, the Low Countries, Scandinavia, and France enabled rapid German victories, leaving Britain as the sole remaining opponent of Germany in Europe by the summer of 1940. Faced with the geographic obstacle of the English Channel, Germany chose to cow Britain into submission with a bombing campaign that would later be known as the Battle of Britain. Despite earlier British fears about the Luftwaffe’s bombing capabilities, the combination of technological innovations in air defense, a strong national spirit, and German dissipation of their bombing effort resulted in a British victory and also became an early indication of the symbiotic relationship between bomber and fighter aircraft that would be tragically emphasized in subsequent Allied bombing campaigns.

On December 7, 1941, Japanese dive and torpedo bombers from four Japanese aircraft carriers struck the naval base at Pearl Harbor and airbases on Oahu, bringing the United States into the war more than 2 years after its start in Europe. In April 1942, the United States responded by bombing Japan with 16 U.S. Army B-25 bombers launched from the aircraft carrier USS *Hornet*, known afterward as the Doolittle Raid. While the actual raid itself was of limited tactical value, the psychological effects of the raid were widespread, bolstering morale in the United States and forcing Japan to dedicate significant additional personnel and resources to homeland defense.

With insufficient forces, equipment, and training to mount an amphibious invasion of Europe until June 1944, strategic bombing was one of the only options available for the British and Americans to strike directly at Germany. In 1943, American and British heavy bombers began the Combined Bomber Offensive (CBO) against industrial areas seen to be critical to the Nazi war effort. Without fighter escorts that had sufficient range to accompany the heavy bombers to and from their targets, Allied bombers suffered heavy initial losses from German air defenses. When bombing and navigational accuracy fell far short of prewar estimates, British bomber crews resorted to night area bombing of

A vintage B-25 Mitchell bomber flies near the National Museum of the U.S. Air Force at Wright-Patterson Air Force Base, Ohio, during a memorial flight honoring the Doolittle Tokyo Raiders, April 18, 2010. The reunion commemorated the anniversary of the Doolittle Raid, April 18, 1942.

German cities, including firebombings that destroyed Dresden and Hamburg. American bomber units used technical innovations like the Norden bombsight to pursue daylight precision bombing against key war-related infrastructure but continued to suffer heavy losses until long-range escorts like the P-51 Mustang were introduced. In the Battle of the Atlantic, B-25s armed with radar and depth charges eventually made it virtually impossible for German submarines to successfully interdict Allied shipping, even in remote waters. While controversies about the effectiveness of the Allied bombing campaign in Europe continue even today, most analysts and historians agree that it played *a* decisive role, even if not *the* decisive one, in defeating Nazi Germany.

Bomber aircraft played a decisive role in most of the key engagements of the Pacific campaign. U.S. Navy torpedo and dive bomber actions against the

Japanese navy at the Battles of the Coral Sea and Midway effectively ended the Japanese offensive drive in the Pacific, putting them on the strategic defensive for the remainder of the war. Under General George Kenney's leadership, American bomber crews in the Pacific were trained to skip bomb and strafe Japanese ships with locally modified long-range bombers, combining with the U.S. submarine interdiction effort to strangle Japanese shipping. Long-range B-29 Superfortress bombers began to directly attack the Japanese homeland with devastating firebombing attacks and destroyed the Japanese cities of Hiroshima and Nagasaki with atomic bomb attacks in August 1945. These attacks, combined with the cumulative effects of the Allied campaign, forced Japan to accept unconditional surrender terms in September 1945, bringing World War II to an official close.

By the end of World War II, the prewar theories that strategic bombing could end wars by itself remained unproven. But what had become apparent was that strategic bombing had played a key role in the defeats of both Germany and Japan and that the possibility of nuclear weapons delivered by intercontinental bombers had changed the character of war forever.

The Cold War

The United States emerged from World War II as the world's sole nuclear power, but it was soon joined by the Soviet Union, which exploded its own bomb in 1949 and reverse engineered confiscated American B-29 bombers to produce clone TU-4 Bull bombers to carry it. Until the development of the first intercontinental ballistic missiles in the late 1950s, nuclear armed bombers became the primary focus of the newly formed U.S. Air Force. Guided by General Curtis LeMay, the newly created U.S. Air Force's Strategic Air Command prepared to respond

to a potential Soviet nuclear bomber attack at a moment's notice, with combinations of U.S. nuclear bombers on continuous ground and air alert.

Korea

The U.S. experience in Korea disavowed previously popular theories that nuclear weapons had made conventional warfare obsolete and gave further evidence that strategic bombing on its own was not likely to end wars. Despite strategic bombing attacks throughout Korea, the North fought on, and China entered the war on North Korea's side in late 1950 despite the fact that the United States had nuclear bombers and China did not. Using conventionally armed B-29s in Korea also exposed the vulnerability of World War II-era bombers to modern air defenses, and Strategic Air Command quickly developed faster and higher flying jet bombers like the B-47 Stratojet and B-52 Stratofortress to ensure the viability of the U.S. nuclear deterrent. Korea

Strategic Air Command B-47 Stratojet bombers. The B-47, the world's first swept-wing bomber, normally carried a crew of three—pilot, copilot (who operated the tail turret by remote control), and an observer who also served as navigator, bombardier, and radar operator.

Source: U.S. Air Force.

also highlighted the importance of bomber aircraft detailed for close support of ground forces, a lesson that was learned but largely forgotten by Vietnam.

Vietnam

Bombers played a significant, albeit indecisive role during the U.S. involvement in Vietnam. Operation Rolling Thunder, a 3-year bombing campaign against North Vietnam, applied graduated levels of punishment to coerce the North to cease armed aggression and end its support of the Viet Cong insurgents in the South. While the campaign did produce some tactical successes, the ultimate failure of Rolling Thunder was a strategic one, attempting to apply limited attacks against an enemy fighting an unlimited war of national survival. Later in the war, U.S. bombers supporting the South Vietnamese were able to forestall the North Vietnamese Easter Offensive of 1972, even after major U.S. ground forces had pulled out of South Vietnam, and the massive B-52 raids of Operations Linebacker I and II were sufficient to compel the North Vietnamese to return to the negotiating table.

With the introduction of laser-guided bombs and missiles, Vietnam marked the beginning of precision bombing, but it also highlighted continuing problems using air force bombers to provide close air support (CAS) to ground troops. These lessons learned were incorporated into the design of ground attack capable fighter bombers like the A-10 Thunderbolt, F-16 Fighting Falcon, and F-15E Strike Eagle.

Post-Vietnam Era

Facing a growing Soviet numerical superiority in Europe, U.S. forces had to find new ways to improve quality with limited quantities of combat forces. While B-52 bombers would remain on nuclear alert as they had for much of the Cold War, the supersonic B-1 Lancer was designed to penetrate below Soviet radar defenses to deliver nuclear weapons. New medium bombers like the FB-111 Aardvark would use laser-guided bombs to strike Soviet forces and logistics chokepoints before they could be brought to bear on lesser numbers of North Atlantic Treaty Organization (NATO) forces. Additionally, the United States was secretly developing stealth technologies to make aircraft practically undetectable by radar, resulting in the F-117 Nighthawk and B-2 Spirit bomber.

In 1986, provocations by Libya, including ties to a terror bombing that killed two U.S. servicemen in

West Berlin, prompted U.S. policymakers to order a swift military response. During Operation El Dorado Canyon, U.S. FB-111 bombers based in England and carrier-based strike aircraft bombed targets in Libya, including direct attacks on the Libyan leader Muammar Qaddafi. After the raid, Libyan provocations were generally curtailed, giving additional credence to theories that in the right circumstances, bombing might create decisive effects without the use of ground forces.

Operation Desert Storm

As the anti-Iraq international coalition formed in response to Saddam Hussein's 1990 Iraqi invasion of neighboring Kuwait, a cell of U.S. Air Force air power theorists led by U.S. Air Force colonel John Warden was developing a new way to use the air weapons originally designed to fight the Soviet Union in Europe. Warden's "Checkmate" planners proposed that by using parallel, precision air attacks to bomb key nodes of the Iraqi air defenses, leadership, communications, key infrastructure, and military forces, the Iraqis might be compelled to withdraw from Kuwait even before a ground offensive was initiated. This plan, eventually adopted as the Desert Storm air campaign, pounded Iraqi targets for more than a month before ground operations began and set the stage for the successful ejection of Iraqi forces from Kuwait in less than 100 hours of ground combat. Daily media briefings showing footage of cruise missiles and laser-guided bombs flying into the windows of enemy bunkers not only highlighted the new precision capabilities brought about by advances in technology but also may have given many an inflated impression about the effectiveness of precision bombing in generating decisive political effects.

After Desert Storm

In the wake of Desert Storm, precision aerial bombing was largely seen as a low-risk, high-reward method to create desired political outcomes. Precision weapons coupled with new Global Positioning System (GPS) technology greatly increased the likelihood that the intended target, and only the intended target, would be struck, and with the addition of the B-2 stealth bomber in 1989, it seemed more and more likely that the United States would practically be able to strike at its will. U.S. bombers and cruise missiles quickly became the weapon of choice to

coerce intransigent leaders in Bosnia (1994, 1995), Afghanistan (1998), Sudan (1998), and Iraq (1996, 1998), despite the fact that such bombings seldom achieved lasting political results. The limitations of an “air-alone” strategy were dramatically highlighted in the 1999 NATO-led effort against Serbian ethnic cleansing in Kosovo—Operation Allied Force. For 78 days, NATO forces bombed targets in Kosovo and Serbia, going far beyond the 2–3 days of strikes as originally planned. While only a few B-2 missions flown from the United States utilized the new GPS-guided Joint Direct Attack Munition, GPS input to the navigational systems of older bombers like the B-1 and B-52 greatly increased the accuracy of even unguided bombs, allowing U.S. bombers to cut Serbian runways with short strings of Vietnam-era Mark 82s that would previously have only been used in an area bombing role. NATO’s campaign over Kosovo was ultimately successful, but it also highlighted several significant limitations of precision bombing. The accidental bombing of the Chinese Embassy with Joint Direct Attack Munition highlighted that precision in prosecution did not equal precision in targeting and could not prevent all accidental collateral damage. The inability of NATO aircraft to stop Serbian ethnic cleansing demonstrated the limitations of air attacks against dispersed ground forces among civilian populations. Finally, the shoot down of an F-117 demonstrated that stealth was not a guarantee of survivability in the modern antiaircraft threat environment, and the F-117 was retired soon afterward.

Post-9/11 Global War on Terrorism

In the wake of al Qaeda’s September 11, 2001, attacks on the United States, the United States was faced with the challenge of eliminating their operations in remote Afghanistan and toppling the Taliban government that had given them sanctuary. To do this, U.S. forces rapidly adopted a strategy of assisting the native resistance Northern Alliance forces with a combination of special operations air controllers on the ground, calling in strikes from bomber aircraft to attack Taliban defenses. With the new precision allowed by GPS-guided bombs, even the Cold War legacy bombers like the B-52 became highly effective CAS platforms, and at times, the mere sight of its contrails curtailed al Qaeda and Taliban activities. Remotely piloted aircraft,

or RPAs (labeled at the time as unmanned aerial vehicles), quickly became high-demand assets for their full motion video capabilities, and as weapons were added to them, they were increasingly used simultaneously as surveillance and bomber aircraft. Through a combination of RPA direct attacks against the al Qaeda and Taliban leadership and CAS for Northern Alliance offensives, the remaining Taliban and al Qaeda elements were forced to retreat to distant areas in Afghanistan and Pakistan, where they would continue their resistance to the new Afghan government for years.

The decision to overthrow the Iraqi regime in 2003 called once again on the U.S. bomber fleet, which through a combination of interdiction bombing and CAS missions helped the coalition forces to rapidly topple Saddam Hussein’s regime. Irregular warfare continued long after the capture and execution of Hussein and, with almost constant on-call interdiction and CAS missions, quickly became the new reality over Iraq for years after the initial invasion.

The Present and Future of Bomber Aircraft

At present, the U.S. strategic bomber force continues to be composed of the B-1, B-52, and B-2 stealth bombers, with only the latter two retaining nuclear weapon delivery capability.

RPAs continue to be used for sensitive bombing missions in the current overseas contingencies, and multirole fighter bombers like the A-10, and the F-16 and the F-15E Strike Eagle. The F-35 program, currently under development, will serve as the replacement for the current legacy fighter bombers. While there is no currently specified program for a next-generation bomber, the U.S. Air Force is examining a range of next-generation, long-range strike options. Possible future options include combinations of stealth manned and unmanned bombers armed with hypersonic cruise missiles, large- and small-diameter precision-guided weapons, massive ordnance penetrator warheads, directed-energy weapons, or weapons dispersing high concentrations of small, high-velocity projectiles.

AIRCRAFT, FIGHTER

The fighter aircraft is an aircraft principally designed to be employed in combat against other aircraft to secure control of the air. It is the primary means by which air superiority is gained and by which ground forces, naval fleets, or other air assets may prosecute tactical or strategic operations with a measure of protection from enemy air attack. The modern

fighter is a relatively small, single- or twin-engine design, crewed by one pilot. Fighter-interceptors generally possess greater range and are more likely to be twin engined and twin crewed. The fighter's design characteristics include high speed, high rate of climb, maneuverability, and effective avionics and weapons suites. The fighter aircraft, in all its permutations, has remained an integral part of air forces since World War I. This entry reviews the roles and capabilities of modern fighter aircraft, tracing their evolution from World War I to the present.

World War I, 1914–1918

The fighter grew out of the necessity to deny enemy reconnaissance aircraft free range of the airspace over the battlefield. Pilots initially fired pistols at each other or took aloft rods, chains, and almost anything else that could be thrown at their opponents, but the fighter aircraft was properly born when scout airplanes were outfitted with fixed machine guns. For sighting and structural reasons, guns were optimally placed near the centerline of the aircraft, but this presented the technical challenge of shooting through the propeller. The adoption of interrupter or gun-synchronizer gear, which allowed bullets to pass harmlessly through the spinning propeller blades, solved the problem. The first practical fighter to employ such an arrangement, the German Fokker Eindecker, dominated the skies until other aircraft such as the Sopwith Pup and Camel were similarly equipped. Aeronautics progressed rapidly through 1918, with speeds reaching 135 miles per hour, heavy-caliber machine guns being taken aloft, and, in the guise of the fighter-bomber, light bombs being effectively employed against troop formations.

World War II, 1939–1945

War accelerated the pace of aeronautical development and expanded the roles played by fighter aircraft in combat. Building on the developments of the interwar years, fighters progressed from wood structures with fabric coverings to metal structures with stressed skin (monocoque), low-winged streamlined bodies, retractable landing gear, and supercharged piston engines producing upward of 2,500 horsepower. Such fighters could reach speeds of 450 miles per hour and climb past 40,000 feet. The war saw the return of the fighter-bomber concept of World War I,

initially in the guise of the German Messerschmitt Me 109—dubbed *Jagdbomber*—followed by the Hawker Hurricane, Curtiss P-40 Warhawk, and most notably the Republic P-47 Thunderbolt. In fact, the classic fighters of the war such as the North American P-51 Mustang, Supermarine Spitfire, Focke-Wulf Fw 190, and Lockheed P-38 Lightning were all employed in bombing at some point.

The variety of armament proliferated with the variety of missions. Batteries of machine guns and cannons of 30-millimeter size were effective against ground targets and bomber aircraft, while the widespread use of unguided rockets increased the fighter-bomber's lethality. Sweeps into German-occupied Europe by Allied fighter-bombers decimated troop formations and paved the way for the Normandy landings. In the fighter-escort role, the Mustang mounted external fuel tanks to accompany heavy bombers from Britain to their German targets, ending the terrible losses suffered by the strategic bombardment forces.

Technological Advances

Radar revolutionized the air war by extending the range at which enemy aircraft could be detected. Used to great effect during the Battle of Britain, radar allowed the marshaling of limited Royal Air Force fighter resources to effectively repel the Luftwaffe onslaught. Radar eventually found its way aboard night fighters, such as the twin-engine Northrop P-61 Black Widow. The war also saw the introduction of jet propulsion and swept wings. The German Messerschmitt Me 262 showed a great performance advantage over its piston-engined counterparts but entered service too late and in too few numbers to have an effect on the war.

The Cold War Era, 1945–1991

Speeds increased significantly in the immediate postwar period. The experimental Bell X-1 broke the sound barrier on October 14, 1947, and soon after, the prototype of the North American F-86 Sabre fighter broke through Mach 1 in a shallow dive. Hereafter, supersonic flight defined all succeeding fighter designs. The navies of the world lagged in the introduction of jet engines and swept wings primarily out of concern for their suitability to aircraft carrier operations. Combat experience soon forced their hand.

The Korean and Vietnam Wars

The emphasis on nuclear warfare and misilery profoundly influenced fighter designs of the 1950s and 1960s. The requirements for a high dash speed, altitude, range, and missile load, and a complex avionics suite triumphed over an earlier era's maneuverability, pilot visibility, and simplicity. The assumptions inherent in Cold War-era fighter design were challenged during the Korean War, where the simple and robust Soviet MiG-15 acquitted itself well against all U.S. fighters save the F-86. But it was not until the Vietnam War that combat experience definitively showed that many of the age-old principles of air warfare—long considered obsolete in the nuclear age—remained in fact relevant. Missile armed fighters, such as the McDonnell Douglas F-4 Phantom, were hastily outfitted with gun armament, and nuclear fighter-bombers, such as the Republic F-105, were pressed into service in the conventional bomb-dropping role with mixed results. A serious reassessment of fighter design and air war tactics took place in the wake of the Vietnam War.

The "Teen Fighters"

The resulting rethink leveraged America's lead in propulsion technology, microcircuitry, and advanced production materials to produce the "teen series" line of fighters. The new fighters emphasized good maneuverability, superior transient performance, a high thrust-to-weight ratio, and, in an ode to dog-fights past, good pilot visibility and an internally mounted gun. The aircraft that emerged during the 1970s set the fighter standard for a generation and more. The U.S. Navy's fleet defense fighter, the Grumman F-14, was first out of the gate. This complex two-crewed interceptor introduced the state-of-the-art AWG-9 radar—capable of tracking 24 targets simultaneously and engaging 6 at a time—and the 100-plus-mile ranged AIM-54 Phoenix air-to-air missile. Its broad U.S. Air Force equivalent, the McDonnell Douglas F-15, represented a no-holds-barred attempt to recapture America's lead in fighter design. The F-15 featured high maneuverability, an excellent avionics suite, and two powerful turbofan engines that allowed it to set a number of international time-to-climb records. It has established an enviable combat record of 104 kills to 0 losses in air-to-air operations.

The "High/Low Mix"

Both the F-14 and F-15 proved superbly capable but prohibitively expensive. A solution presented itself in the production of large numbers of lower cost complementary fighters as part of the "high/low mix." The U.S. Navy's McDonnell Douglas F/A-18 and the U.S. Air Force's General Dynamics F-16 emerged as a result. Although initially intended as the "low" end of the mix, both designs evolved over subsequent decades into fine fighter-bombers as capable in many areas as the "high"-end fighters. Irrespective of their position within the high/low matrix, the four designs featured similar armament in the form of the 20-mm M61 six-barreled Gatling gun (capable of 100 rounds per second rate of fire), the short-range infrared-guided AIM-9L/M Sidewinder missile, and the medium-range AIM-7M/P Sparrow semi-active radar homing missile. The teen fighters continue to undergo progressive updates featuring improved engines, avionics, and weapons systems. The highly effective AIM-120 AMRAAM (Advanced Medium-Range Air-to-Air Missile) has replaced the Sparrow missile, while the Sidewinder currently in use is the AIM-9X variant. The F-14 was retired from service in 2006, but the remaining teen fighters are not only in service but continue in production, primarily for export customers.

International Developments

In the late 1970s, the Soviet Union responded to developments in American fighter design with an ambitious and broadly comparable high/low mix of its own. The Sukhoi Su-27 air superiority fighter and Mikoyan MiG-29 fighter-bomber were the result. Both were very maneuverable, but the Sukhoi particularly was possessed of an extraordinarily large weapons suite and very long flying range. Both designs initially suffered from a lack of advanced avionics but have in recent years undergone considerable updates of their radar and weapons systems. The French Dassault Mirage 2000, another late-1970s product, was a fine interceptor that, by way of a two-seat variant, evolved to undertake the strike-fighter role. European efforts of the period are best represented by the multinational Panavia Tornado produced as a first-rate strike fighter and a sophisticated but somewhat underpowered interceptor.

Post–Cold War Period

The post-1989 period saw remarkable technologically driven change shape the capabilities and roles of the fighter aircraft. The revolution in micro-circuitry, apparent even before the conclusion of the Cold War, elevated in importance the avionics of aircraft to the same level, if not higher, as their aerodynamic performance. Detection and targeting systems on board fighters and external platforms such as the E-3 Airborne Warning and Control System and E-8 Joint Surveillance Target Attack Radar System, combined with the widespread availability of aerial refueling, resulted in a manifold expansion of the combat capabilities of fighter aircraft. The Low Altitude Navigation and Targeting Infrared for Night navigation and targeting system and related LITENING and Sniper XR systems have given the fighter a potent strike capability, equally effective in day or night and in adverse weather. Married with precision-guided munitions, the modern fighter is a powerful weapon indeed, endowed with the destructive power of dozens, if not hundreds, of World War II-era heavy bombers.

But the real revolution in fighter design occurred with the introduction of low-observable, or stealth, technology that allowed aircraft to operate with relative impunity within a sophisticated integrated air defense environment. The now retired Lockheed F-117 pioneered stealth in an operational fighter design and found wide employment in major combat operations such as the 1991 Persian Gulf War and the 1999 Kosovo War. Its fusion of stealth and precision weapons reset air warfare back to the “big sky” environment of the preradar era. Stealth has proven so effective that every subsequent new U.S. fighter and bomber design has incorporated low-observables as a primary design requirement.

Fifth-Generation Fighters

Recent new generation fighters have improved on many of the aerodynamic qualities of their predecessors while adding stealth, sensor fusion (integrated avionics), active electronically scanned array (AESA) radars, and sustained supersonic flight (supercruise). Occupying the lower end of this new spectrum of capabilities are the European Dassault Rafale, Eurofighter Typhoon, and Saab Gripen. The high end is the domain of the Lockheed Martin

F-22 Raptor, while the middle finds the F-35 and, possibly, the Russian Sukhoi T-50. The F-22, a single-seat twin-engine fighter, blends these new so-called fifth-generation fighter traits particularly effectively, while adding the capability of poststall maneuvering. Its ability to operate at very high altitudes (60,000 feet) and high sustained speeds (Mach 1.5+) imparts on its weapons a tremendous kinematic advantage, while denying it to others. The Raptor is primarily an air superiority fighter, but in line with recent trends toward multirole capability, it can employ air-to-ground Global Positioning System-guided munitions. Another stealth aircraft, the single-seat and single-engine F-35, will serve alongside the F-22 in the U.S. Air Force and in the air forces of many export customers as primarily a strike-fighter capable of significant air-to-air operations. The F-35 will achieve even greater levels of sensor fusion than the Raptor but will not enjoy that aircraft’s high-altitude/high-speed capabilities or its poststall maneuverability.

Future Directions

The astounding rise in the capability of fighters has been accompanied by an equally astounding rise in their cost. Few nations can now afford to develop world class fighters indigenously. The costs of developing the Eurofighter Typhoon were shared between four European nations—Italy, Spain, Germany, and Great Britain—but have nevertheless proven prohibitive. Rising costs have likewise forced the U.S. Air Force to settle on 187 Raptors, a much reduced number from the originally planned 750 aircraft. The price tag for fighter aircraft has forced an almost universal acceptance that the modern fighter must be multirole capable—equally proficient in air combat as it is in strike. Modern sensor fused avionics, multifunction displays, and advanced targeting systems make the true multirole fighter possible. The F-35 design concept takes this philosophy to the next level by providing a single platform for three disparate requirements: a U.S. Air Force fighter-bomber, a navy carrier-capable strike fighter, and a U.S. Marines short takeoff/vertical landing fighter-bomber. This ambitious program relies on unprecedented levels of avionic sophistication, advanced aerodynamics, and cutting-edge manufacturing techniques to satisfy the F-35’s disparate mission requirements. Beyond the F-35, it is increasingly likely that unmanned platforms will take over the

role of the fighter, continuing a trend begun in the 1970s but accelerated in operations over the skies of Afghanistan and Iraq.

AIRCRAFT, PATROL

Maintained by navies and air forces throughout the world, patrol aircraft are tasked with supporting other combat platforms by performing maritime reconnaissance and intelligence gathering as well as antisubmarine and antisurface warfare. The capabilities of patrol aircraft have evolved; however, as the U.S. military and its allies have shifted their focus away from watching large “blue water” (high seas capable) navies to combat against global terrorism, patrol aircraft have come to provide long-range reconnaissance for ground forces. This entry describes missions and features of patrol aircraft from World War I to the present.

Combat History

World War I

The U.S. Navy patrol aircraft made their combat debut during World War I. During that conflict, naval aviators operated seaplanes from bases in the British Isles, France, and Italy. From these bases,

navy patrol aircraft flew more than 3 million miles of patrol missions and sank 12 enemy submarines using a mix of machine guns and various aerial bombs.

World War II

Following the combat experiences of navy patrol aircraft in World War I, the interwar period saw the development of new monoplane patrol aircraft that cemented the importance of patrol aircraft within the U.S. Navy during World War II due to their versatility. In the Atlantic, the PBY Catalina and the PBM Mariner, armed with a mix of aerial depth bombs and airdropped torpedoes, were an integral part of allied antisubmarine warfare (ASW) operations against the Nazi U-boat threat. Conversely, in the Pacific, the PBY Catalina was a mainstay as a reconnaissance aircraft. The most famous example of this was the role the Catalina played in finding the Imperial Japanese Navy prior to the Battle of Midway.

Cold War Era

U.S. Navy patrol aircraft performed many important missions against the Soviet navy during the Cold War period. At the core of these operations were surveillance flights against the Soviet surface fleet and ASW operations against a formidable mix of diesel-electric and nuclear-powered submarines. To perform these missions, the navy developed a fleet of patrol aircraft, with the capability to fly long ranges, that were equipped with a variety of sensors and new weapons that ensured that U.S. Navy patrol aircraft were capable of meeting any threat from the Soviets for more than 50 years.

Early Cold War Patrol Aircraft

The early Cold War period saw the U.S. Navy once again use a mix of seaplane and land-based aircraft. The land-based Lockheed P2V Neptune entered service with the navy during the late World War II period. The emergence of the Neptune was due to a series of upgrades in the late 1940s and throughout the 1950s to all aspects of the Neptune including, perhaps most importantly, its ASW suite. These upgrades saw later models of the Neptune feature both passive and active sonar, magnetic anomaly detection equipment, and new search radars.

On the seaplane side, the navy also relied on the Martin P5M Marlin seaplane during the early Cold War period. The Marlin featured a range of 2,880 nautical miles and a cruising speed of 150 miles per hour, was equipped with a host of electronics to help with surface and submarine detection, and could employ a variety of weapons such as bombs and torpedoes housed on wing nacelles and inboard pylons.

Late-Era Cold War Patrol Aircraft

Despite the capabilities of both the Neptune and the Marlin, the Lockheed Martin P-3 Orion quickly overshadowed both aircraft. Based on the Lockheed Martin L-188 Electra airliner, the P-3 became operational in August 1962. An early variant of the aircraft had a combat radius of 4,700 nautical miles, was outfitted with the most advanced electronics suite available for a patrol aircraft at that point, including upgraded search radars and passive and active sonar, and could deliver 23,250 pounds of munitions. With these characteristics, the early models quickly proved their worth when they conducted patrols as part of the navy's quarantine during the Cuban Missile Crisis.

The performance of the P-3A during the missile crisis proved the worth of the P-3 as the U.S. Navy's patrol aircraft of the future, and the aircraft went through various upgrades throughout the Cold War to maintain its frontline status. The culmination of these efforts was the P-3C, which entered service with the fleet in 1969 and was the primary patrol aircraft for the navy throughout the rest of the Cold War period.

Post-Cold War Era

The P-3 in the Post-Cold War World

With the end of the Cold War, the patrol community of the U.S. Navy has had to adapt to new missions, including operations in the littorals and providing reconnaissance for allied ground forces. During the Persian Gulf War (1991), the venerable P-3 performed blockade and identification operations that harkened back to the Cuban Missile Crisis. Orion operations continued in Iraq and Afghanistan. In Afghanistan, the P-3 provided timely information regarding the position of Taliban and al Qaeda fighters to Special Operations forces and fighter-bomber aircraft during Operation Anaconda in the spring of 2002. Then, during the Iraq War, the

P-3 once again conducted command, control, communications, computers, intelligence, surveillance, and reconnaissance (C4ISR) for coalition forces at sea and on land. Finally, U.S. and international force P-3s have been used routinely on antipirate operations off the coast of Somalia.

The S-3 Viking in the Post-Cold War World

Patrol aircraft are not just limited to land-based operations. Originally designed by Lockheed as the U.S. Navy's primary carrier-borne antisubmarine warfare aircraft, the S-3 Viking found a role in the post-Cold War navy as a carrier-borne patrol aircraft. This mission saw the Viking performing nontraditional surveillance, intelligence, and reconnaissance during the first 9 years of the Global War on Terrorism. This took the aircraft to such theaters of operation as Afghanistan until the navy phased out the aircraft completely in 2009.

Future Patrol Capabilities

Although the P-3 has provided the U.S. Navy with 48 years of service, the navy has begun the process to replace the Orion. The aircraft tapped to do so is the P-8 Poseidon. Based on the Boeing 737-800ERX, the Poseidon will have an operational range of 1,200 nautical miles, a station time of more than 4 hours, and an open mission concept that will allow it to perform many different tasks, and it will be capable of being armed with torpedoes, mines, and cruise missiles. The navy hopes that these capabilities will allow its patrol force to be an important part of the service for years to come.

AIRCRAFT, RECONNAISSANCE

Aerial reconnaissance aircraft are flying platforms designed to use their aerial perspective to provide superior tactical and strategic reconnaissance for militaries. Aerial reconnaissance began as cameras attached to hot air balloons and evolved to purpose-built planes to take images of troop movements, locations of weapons caches, and other important military intelligence to further tactical and strategic operations. These aircraft have experienced constant development since the advent of powered flight; in recent decades, new technologies have moved to the fore, taking on an ever-expanding role in aerial reconnaissance. Satellites launched into space are used to spy on targets from their orbits above the earth. Remote-controlled drones represent the latest tool in the U.S. Air Force's arsenal for both gathering intelligence for the air force and striking enemy targets, with no risk of American lives. With the increasing significance of nonstate actors and the ongoing efforts to limit global terrorism, it is clear that aerial reconnaissance platforms will continue to play a vital role for the foreseeable future. This entry discusses the evolution of aerial espionage and examines modern reconnaissance platforms.

Early History

Even before the origins of powered flight, militaries utilized aerial platforms for the purpose of gathering reconnaissance. During the U.S. Civil War, for instance, both Northern and Southern forces enlisted balloons to gain an aerial perspective of enemy troop positions in the hopes of improving tactical positioning. Following the Wright brothers' first successful powered flight in 1903, the brothers sought to sell the U.S. military on the

value of a mobile aerial platform. In 1909, the Wright Military Flyer became the first military aircraft, joining the U.S. signal corps as a reconnaissance platform. Until World War I, reconnaissance remained the primary role for military aircraft, working to determine enemy troop movements and supply lines and functioning as artillery spotters.

World War I witnessed a massive expansion of military flying, as all of the major combatant powers rushed to use aerial platforms for military gain. In fact, the advent of fighter—or pursuit—aircraft began as an effort to shoot down enemy reconnaissance platforms. During the war, reconnaissance remained perhaps the most important role for aircraft, with platforms such as the Albatros CI and RAF R.E.8 playing key roles.

During the interwar period, military powers around the world continued to develop reconnaissance platforms, with both land- and sea-based forces seeing the continued need for mobile, aerial platforms. These continued developments ensured that both the Allied and the Axis powers would field a variety of important reconnaissance aircraft during the Second World War. During that conflict, seaborne flying boats such as the British Short Sunderland, American PBY Catalina, and Japanese Kawanishi H6K4, as well as the German land-based Focke Wulf Fw 200 Condor, played vital roles in both the Atlantic and Pacific theaters, hunting for enemy submarines, searching for convoys and other ships, and tracking naval movement. Over land, planes such as the German Fieseler Fi 156 Storch, British De Havilland Mosquito, and American F-6C (the reconnaissance version of the famed P-51 Mustang) served ably, tracking troop movement, photographing proposed targets for tactical and strategic bombing, and functioning as bomb damage assessment platforms.

The Cold War era saw the continued significance of aerial reconnaissance, with platforms evolving to fly higher and faster for self-protection and to provide a wider field of view for cameras and other imaging equipment. During this period, however, reconnaissance platforms grew more specialized as distinct reconnaissance roles emerged, such as maritime patrol, high-altitude reconnaissance, close air support, and strategic reconnaissance. In the U.S. arsenal, the P3 Orion came to serve as the primary maritime patrol aircraft and submarine hunter, while converted fighter aircraft such as the Republic

RF-84F Thunderflash and RF-101 Voodoo served in land-based roles. At the same time, smaller piston-engined aircraft like the Rockwell OV-10 Bronco provided tactical reconnaissance and immediate support for troops on the ground.

The Cold War period also witnessed the emergence of strategic reconnaissance platforms such as the Lockheed U-2 and SR-71 Blackbird. These aircraft were specifically designed to fly at high altitude and overfly the Soviet Union to gather vital strategic information. This was a risky mission, however, as demonstrated by the Soviet Union's successful downing of American U-2 pilot Francis Gary Powers in 1960. Those risks, coupled with the increasing sophistication of satellite technology, gradually resulted in a transition to satellite-based strategic intelligence.

The Post-Cold War Era

In recent decades, there has been a more general shift in aerial reconnaissance from manned vehicles to unmanned aerial vehicles or UAVs. This shift came from the collapse of the Soviet Union. Without the Soviet Union, politicians were loath to spend money on more bombers, fighters, and reconnaissance planes. In 1990, the air force printed a white paper titled "The Air Force and U.S. National Security: Global Reach-Global Power." This paper outlined the air force's new strategy for preparing itself for the next century of aerial combat, with a focus on speed, range, and flexibility. The thrust of the paper was "controlling the high ground." The high ground in this scenario outlined by the U.S. Air force (USAF) was space, through the use of surveillance satellites. The surveillance planes it already had in service, such as the E-3 AWACS and E-2C Hawkeye, remained key elements in gathering intelligence for frontline commanders to make crucial decisions but played an ever-decreasing role in strategy.

While reconnaissance satellites could provide incredible intelligence, there were considerable drawbacks to using satellites. The image quality was affected by weather, and the satellites' orbits were difficult to alter once they were initially set. Having to wait for the satellite to eventually line up with the target could be time-consuming, and even then, there was no guarantee that the intended target would remain stationary. As such, the USAF increasingly turned to UAVs to get reliable intelligence in

target areas without risk of losing U.S. service members to enemy fire.

UAVs possess a unique attribute in the air force's arsenal—the ability to acquire reliable, accurate intelligence from target areas without making the difficult request to move satellites outside their orbits and without risking pilots' lives in potentially high-risk missions. The idea of the UAV was first introduced in the 1950s, but they were shelved in favor of manned reconnaissance planes because the equipment used on these UAVs was time-consuming to process. Initially, UAVs suffered from a number of problems. For instance, existing film-developing technologies worked well for stationary targets like bases or factories, but proved impracticable for targets that were mobile. It simply took too long for the film to develop for "real-time" or "instant" intelligence for things like troop movements. Without these substantial technological upgrades, UAVs could not be utilized effectively in the field. The technology to make UAVs a viable military asset would not be available for another four decades.

Modern Reconnaissance Aircraft

By the 1990s, the technology related to UAVs caught up with how the air force intended to use UAVs in wartime scenarios. UAVs first saw extensive action in the Persian Gulf War. Advances in computer processing allowed for better and complex navigation control systems. Breakthroughs in miniature video cameras improved the resolution quality of images and video taken during reconnaissance flights. The advent of Global Positioning System navigation finally allowed for accurate navigation in real time. This new technology enabled the UAV to be the military asset the air force originally envisioned. The air force experimented with smaller robotic UAVs in 1991, during Operation Desert Storm, with the BQM-147 Exdrone and FQM-151 for reconnaissance missions. However, these drones were not as useful as the larger UAVs due to technological constraints—their onboard black-and-white cameras lacked the resolution to clearly pick out details in a desert setting. In addition, these drones had a short operating range that limited their use considering that most of the fighting was done away from areas safe for human operators. These smaller drones were updated with newer technology during the 1990s, and by the early 2000s, with the engagements in

Iraq and Afghanistan, technology had advanced to the point where the smaller drones proved useful in searching for possible enemy ambushes, for improvised explosive devices (IEDs), and for patrolling the perimeters of American and allied airbases. While all American military branches had RQ-2 Pioneer drones and used them for a variety of purposes, the air force primarily used the drones as decoys for the Iraqi military so that manned aircraft flying behind them could knock out parts of the Iraqi surface-to-air missile sites.

In the wake of September 11, 2001, UAVs were used extensively by the USAF and the Central Intelligence Agency for reconnaissance missions. The UAVs used the most were the MQ-1 Predator and the RQ-4 Global Hawk. Both platforms were initially used for intelligence gathering only; however, a hunter-killer version of the Predator was eventually developed by the USAF for tactical strikes. Predator drones make for an impressive and versatile platform for both reconnaissance and hunter-killer missions because the Predator is tiny compared with a regular aircraft and generates much less heat than a conventional airplane, thus making it less likely to be detected by enemy sensor arrays. The Predator can loiter over target areas for greater time periods and can use its laser designator to paint bombing targets in lower and more dangerous altitudes, while the bomber flies in a safer altitude away from enemy anti-aircraft defenses until it drops its payload.

The Global Hawk is a pure reconnaissance UAV. It operates at high altitude and has been extensively used in Iraq and Afghanistan. Although it is difficult to detect, the Global Hawk is not stealthy. Much of what makes UAVs so effective is the instant communication between pilot and platform. Initially, UAVs had to be piloted in-theater in order to be effective. However, with advances in satellite technology, UAVs could now be operated remotely half a continent away. That ability, combined with advances in stealth, propulsion, and airframe technology, has ensured the increasing utilization of new UAVs like the MQ-9 Reaper around the world.

Even with the technological advancements made in UAVs and in satellites, manned reconnaissance planes still played a crucial role in America's military. U-2s and other manned platforms played key roles in the wars in Iraq and Afghanistan and continue to occupy an important place in the ongoing conflict against global terrorism. Additionally,

manned platforms like the P-3 continue to perform vital service in roles unsuitable for UAVs. It seems clear that the UAV will continue to expand its intelligence-gathering role in the immediate future, but satellites and manned aircraft will also continue to provide valuable service. Regardless of the platform, however, it seems clear that aerial reconnaissance will continue to play a key role for militaries around the world in years to come.

AIRCRAFT, TRANSPORT

Although they do not receive as much publicity as other combat-oriented aircraft, transport aircraft play an integral role in modern military operations by allowing nation-states to deploy large amounts of people and materiel to a theater of operations in a timely manner to complete a variety of missions. For the United States, these missions include transporting combat units, support forces, and their equipment into combat. Moreover, a major mission for U.S. transport aircraft is the transportation of humanitarian personnel and supplies into disaster areas around the world. To complete these missions, the Air Mobility Command of the U.S. Air Force maintains a diverse fleet of small, medium, and large transport aircraft to meet any contingency. This entry reviews the history of U.S. transport aircraft, including the types of aircraft and their capabilities, and discusses combat and humanitarian missions from World War II to the present.

Combat History

World War II

Although the concept of transporting materiel via aircraft had been around since the earliest days of the air age, the mass transport of people and materiel for military use was not pioneered until World War II. During that conflict, all of the major combatants maintained transport aircraft fleets that were tasked with transporting service members and their equipment into combat and shuttling spare parts, clothes, food, and combat replacements from rear areas to the front lines.

For the United States, throughout the conflict, the fleet of Douglas C-47 Dakota, Douglas C-54 Skymaster, and Curtiss C-46 Commando aircraft performed missions throughout the European and Pacific theaters.

European Theater

In the European Theater of Operations, the primary combat role of U.S. transport aircraft was to carry allied airborne forces and their equipment into combat. The first allied airborne operation occurred in November 1942. At that time, American C-47s delivered elements of the 82nd Airborne Division to drop zones in North Africa to mixed results. Following operations in North Africa, U.S. transport aircraft were again in action in July 1943, when the Allies invaded the island of Sicily. For the Sicily operation, dubbed Operation Husky, 226 Dakotas carried elements of the 82nd Airborne Division into combat. In addition, 137 more Dakotas towed gliders full of British paratroops. Transport aircraft also carried paratroops into combat during the U.S. invasion of Italy. After the Italian operation, 900 U.S. transport aircraft carried more than 20,000 allied paratroopers into combat during the invasion of Europe in June 1944. After the invasion of Europe, airborne forces flown by U.S. transport aircraft were at the forefront of the allied advance into southern France. During that operation, in August 1944, U.S. transport aircraft delivered almost 9,000 paratroops, jeeps for transportation, artillery pieces, and more than 2 million pounds of equipment in 987 flights. With the two invasions of France completed, the Allies turned to the airborne to consolidate their positions on the continent during September 1944. At the forefront of this operation was the

battle-tested American Troop Transport Command. This time, in the largest allied airborne operation to date, 1,500 C-47s carried 20,000 paratroops and their equipment to drop zones in occupied Holland during Operation Market Garden. Finally, in March 1945, a total of 1,572 C-46s and C-47s carried the U.S. 17th Airborne Division and the British 6th Airborne Division and allied glider units to drop zones across the Rhine River into Germany.

Pacific Theater

In the Pacific Theater of Operations, U.S. transport aircraft had a dual mission. On the one hand, much like their work in Europe, the Allies used transport aircraft to deliver airborne forces into combat against the Japanese. The first of these missions occurred in September 1942. At that time, 79 Dakotas of the 54th Troop Carrier Wing carried the 503rd Parachute Infantry Regiment, which the allied command tasked with capturing the airfield at Nadzab Port Moresby in conjunction with an Australian offensive against Lae Port Moresby. Following the Nadzab operation, the 54th Troop Carrier Wing was again in action in July 1943. This time, 30 aircraft carried elements of the 503rd to drop zones on Noemfoor Island in western New Guinea during Operation Table-Top. Finally, throughout 1944–1945, units with the 54th and 317th Troop Carrier Wings continued to carry the 503rd Parachute Infantry Regiment and units of the 11th Airborne Division on operations in the Philippines and Japan.

On the other hand, apart from the use of transport aircraft to haul airborne troops, an important part of transport operations in the Pacific was the supply operations over the Himalayas run by the Army Air Corps in the China-Burma-India Theater of Operations. Known as “flying the Hump,” General Claire Chennault’s American Volunteer Group flew the missions until the Army Air Corp’s Air Transport Command took over the flights in October 1942. The operations themselves were flown in all types of weather by myriad U.S. transport aircraft, including the C-46 Commando, C-47 Dakota, C-54 Skymaster, and B-24 Liberator. In the end, throughout the course of the war, transport aircraft in the China-Burma-India Theater of Operations delivered more than 650,000 tons of supplies and were vital in transporting wounded

allied troops to better equipped medical facilities farther from the front.

Cold War–Era Military Operations

The Berlin Airlift

The first major U.S. airlift operation of the Cold War occurred from June 1948 until late September 1949. Known as the Berlin Airlift, “Operation Vittles” was the delivery of food, coal, and medical supplies to Berliners who lived behind the Soviet zone of occupation after the Soviets blockaded the road system into Berlin. Throughout the operation, U.S. aircraft operated around the clock, with only breaks for maintenance and fuel. All told, transport aircraft of the U.S. Air Force delivered 1.5 million tons of supplies while flying 189,963 flights using mainly C-47 Dakota and C-54 Skymaster aircraft.

Korean War

Following the Berlin Airlift, the next U.S. transport operation in the Cold War period occurred during the Korean War. Much like the rest of the U.S. military, the air force’s Combat Cargo Command (CCC) was unprepared for the beginning of the conflict. The command rebounded, however, to perform important tactical airlift missions during the duration of the war.

To begin, U.S. transport aircraft flew supply missions in support of the Pusan Perimeter. Moreover, in October 1950, C-47s and new twin-tailed Fairchild C-119 Flying Boxcars dropped the 187th Regimental Combat Team onto drop zones at Sukchon and Sunchon, South Korea. Following the delivery of the 187th, the CCC returned to resupply efforts. During 12 days of operations in support of beleaguered U.S. Marines in the Chosin Reservoir, C-119s delivered 1,483 tons of supplies and evacuated 4,600 casualties. Finally, in March 1951, 173 CCC aircraft delivered 3,487 members of the 187th to drop zones near Munsan-ni, South Korea.

Vietnam War

During the Vietnam War, a new breed of transport aircraft, including the Fairchild C-123 Provider, the Lockheed C-130 Hercules, C-141 Starlifter, and C-5 Galaxy, and the Douglas C-133 Cargomaster, performed both strategic and tactical air supply missions for the U.S. military.

On the strategic level, U.S. transport aircraft flew missions deploying U.S. troops and equipment from the United States to bases in South Vietnam. Of particular note is the use of 88 C-141 jet transports and various other transport aircraft to haul an infantry brigade from Hawaii into direct combat at Pleiku, South Vietnam, in 1965. In addition, in 1967, 369 C-141s and 22 C-133s deployed the 101st Airborne Division from Fort Campbell, Kentucky, to Bien Hoa, South Vietnam. Finally, in 1972, the heavy-lift-capable, jet-powered C-5 Galaxy delivered 49 tanks from Japan to Da Nang, South Vietnam.

Tactically, throughout the war in Vietnam, the C-130 Hercules performed numerous missions. In 1967, in keeping with the tradition of U.S. transport aircraft, 13 C-130s delivered members of the 173rd Airborne Brigade in the only combat jump of the Vietnam War. U.S. transport aircraft were also vital in the survival of the U.S. combat base at Khe Sahn in January 1968. During that operation, U.S. transport aircraft delivered replacements and 150 tons of cargo a day and evacuated Khe Sahn’s wounded. Finally, in 1972, all-weather supply drops by C-130s helped break the siege of An Loc, South Vietnam.

Post–Cold War Era Operations

Following the Vietnam War, U.S. transport aircraft continued to provide strategic and tactical transport support to U.S. forces during operations in Grenada and Panama. However, U.S. transport aircraft truly distinguished themselves in the post–Cold War era during military operations in the Middle East and Afghanistan, as well as performing humanitarian operations throughout the world and in the United States.

Persian Gulf War

In 1990, in response to the Iraqi invasion of Kuwait, the U.S. relied on air force C-141s as well as KC-10 Extender and KC-135 Stratotanker aircraft to move troops and supplies from the United States to bases in the Persian Gulf. In all, these aircraft moved more troops and equipment farther and faster than any time in the history of U.S. transport efforts. Finally, once the deployment of U.S. troops was complete, the C-130 flew more sorties than any other aircraft in the war. Operations during the Persian Gulf War were varied and included supplying allied units, moving units to flank the Iraqi Army, and delivering orders to units in the field.

Operations Enduring Freedom and Iraqi Freedom

Transport aircraft of the air force's Air Mobility Command currently support U.S. forces in Afghanistan and previously supported U.S. forces in Iraq. Transport missions in these theaters include the strategic transportation of troops and equipment from the United States using jet-powered C-17 Globemaster aircraft and the aeromedical evacuation of injured troops from these theaters using specially equipped aircraft. Moreover, using the venerable C-130, transport crews provide tactical movement to allied units. The completion of these operations has led to the Air Mobility Command accumulating some impressive operational statistics. As of 2009, the Air Mobility Command has transported 8.89 million passengers, 3.67 million tons of cargo, and 134,989 patient evacuations in a total of 524,085 flights.

Humanitarian Operations

In addition to the combat operations that U.S. transport aircraft have carried out in the post-Cold War period, from 1947 U.S. transport aircraft have accomplished various humanitarian operations. Like the military operations, humanitarian operations have been diverse and carried out throughout the world.

Domestically, U.S. Air Force transport aircraft have carried out a variety of humanitarian operations. Throughout the post-Cold War period, air force transport aircraft have delivered supplies to hurricane and flood victims, including transporting 14,600 passengers, 300 patients, and 686 loads of material during operations in support of Hurricanes Katrina and Rita. Apart from material transport, U.S. transport aircraft have been implemented by the U.S. Forest Service to fight wildland fires. Finally, specially equipped C-130 aircraft are used to collect data on hurricanes and tropical storms in the Atlantic and Pacific.

U.S. transport aircraft also conduct humanitarian operations internationally. Recently, these operations have centered on disaster relief. As an example, in 2005, U.S. transport aircraft flew 273 flights delivering 15,294,000 pounds of material in support of Pakistani earthquake relief efforts. U.S. transport aircraft were also at the forefront of relief efforts following the December 2004 tsunami in South Asia.

Finally, in 2008, U.S. transport aircraft delivered 200,000 pounds of supplies to earthquake victims in China and 1.1 million pounds of supplies to victims of tropical cyclone Nargis.

Current U.S. Transport Aircraft

The current inventory of U.S. transport aircraft includes aircraft that are tasked with strategic and tactical airlift operations. For these operations, the air force relies on three dedicated transport aircraft. The C-5 Galaxy, one of the largest military aircraft in the world, has a maximum carrying capacity of 270,000 pounds and has the ability to load and offload military grade vehicles using front and rear cargo hatches. The C-5, first deployed in 1969, is currently going through a major engine upgrade that will allow it to remain a strategic airlift asset into the 21st century. The air force also uses the C-17 Globemaster for strategic airlifts. The air force first deployed the Globemaster in 1995. The aircraft has a short takeoff and landing capability and can carry 170,900 pounds of cargo, 102 troops, or 36 litters (stretchers) and 54 ambulatory patients. Finally, for tactical delivery of cargo and troops, the air force relies on the C-130. Debuting it in 1956, the air force currently operates four models of the C-130. The E, H, and J models are capable of transporting any combination of 16 container delivery system bundles, six open cargo pallets, 74 litters in an aeromedical evacuation role, 92 combat troops, or 64 paratroops. In addition, the air force currently operates upgraded J model aircraft with increased carrying capacities in all of the above areas.

AIRCRAFT CARRIERS

An aircraft carrier is a ship capable of handling aircraft that take off and land on its deck. In 1909, the French inventor Clement Ader presented the idea of a ship that carried aircraft. The U.S. Navy began studying and testing this concept in the same year. During the interwar period between World War I and World War II, the U.S. military developed its first actual aircraft carriers. World War II was a turning point in the use of aircraft carrier technology. Carriers replaced battleships as the main ships utilized in fleets, as evidenced in several key battles fought in the Pacific. However, the role and importance of aircraft carriers in war was debated and contested in the decades after World War II. During the Cold War, the U.S. Navy worked on developing increasingly advanced carriers. The creation of supercarriers allowed jet aircraft and planes with nuclear weapons to take off from their angled decks. In the decades after the Cold War, the U.S. Navy continued to update their carrier systems to increase their flexibility in terms of mobility and warfare capabilities. Throughout these conflicts, air power has continually been reaffirmed as a vital aspect of warfare. Today, supercarriers are all nuclear powered, and they typically operate as part of a Carrier Strike Group along with cruisers, destroyers, submarines, and supply ships.

Aircraft carriers symbolize America's role as a superpower. They currently serve as American territory, which frees the United States from relying on overseas land bases in other countries, thus establishing an expansive American presence around the world. This entry examines the history, technology, and roles of aircraft carriers, from World War II to the present.

World War II

World War II was a turning point for the incorporation of aircraft carriers into the U.S. military. During the early 1940s, the U.S. Navy debated whether carriers should remain in the battle line with battleships or move independent of them. Advocates of keeping aircraft carriers in the battle line with battleships thought that battleships were the most important part of the fleet. They saw aircraft carriers as protecting battleships from enemy aircraft, since planes could scout for the battleships, and they believed that a change in position would make aircraft carriers vulnerable to enemy ships. Eventually, however, the U.S. Navy sided with the proponents of independent aircraft carrier action, who recommended using carriers offensively with small ships escorting them.

The U.S. military realized the critical importance of utilizing aircraft carriers after the Japanese attack on Pearl Harbor, during which five American battleships were destroyed by Japanese planes based on fast carriers. By 1942, aircraft carrier forces further proved their role in winning the war in the Pacific. For example, the Battle of the Coral Sea was the first naval battle in history where ships did not directly engage one another and all of the fighting featured carrier-based aircraft. During the war, the U.S. military continued to build new and larger carriers, which played a key role in supporting the U.S. victory and helped ensure American postwar naval supremacy. Since navies take years to develop, American victory in World War II, coupled with American industrial power, meant that other countries did not have a chance to compete with America's supremacy in naval aviation.

After the Army Air Force's strategic bombers dropped atomic bombs on Hiroshima and Nagasaki, the navy's fast carriers seemed vulnerable to the new nuclear warfare and were believed by many to be of diminished importance. To keep up with these new

developments, as well as the emerging jet age, the navy drafted plans for the construction of a supercarrier with the capability of launching jet aircraft-carrying nuclear weapons. However, as a result of interservice rivalries, Congress halted construction of the first supercarrier, the USS *United States*, in 1949.

Cold War

During the Cold War, the U.S. Navy developed aircraft carrier technology capable of launching jet aircraft and conducting nuclear warfare. The Korean War revived the importance of the aircraft carrier, although this was unclear in the early stages of the war. The North Korean Air Force lagged far behind the air power of the United States. Responding to the possible threat of Soviet intervention and after the North Korean seizure of air bases in South Korea, the United States was forced to fly aircraft from bases in Japan. As a result, American aircraft needed to refuel after a short amount of flying time over Korea, which increased the importance of nearby carrier-based aircraft that could spend more time and fuel on their missions. Carriers served several roles during the war. *Essex*-class carriers still provided air support for ground forces defending Pusan. Later, carriers were used to distract attention from Inchon and to drop napalm on the Inchon area before it was invaded. Helicopters also took off from carriers, and they offered supplies, reconnaissance, and medical evacuation, among many other assignments.

Three new British technologies, steam catapults, mirror landing aids, and angled flight decks, came into use on carriers during this time period. Steam catapults allowed for launching jet aircraft (which needed to achieve much higher takeoff speeds to become airborne), while mirror landing aids reflected lights to help pilots land at higher speeds. In 1952, angled flight decks were developed and then tested on USS *Midway*. These decks helped jet aircraft stop and avoid crashing into parked aircraft, since jet tailhooks did not always catch on arresting wires. Supercarriers were also built with larger decks to offer more stability and to provide a larger landing area for aircraft.

After the Korean War, the United States learned that despite having recently experienced the total warfare of World War II, limited wars remained a very real possibility. Furthermore, aircraft carriers offered the nation a way to move forces quickly to

reach any international conflict and assert American power. In the mid-1950s, the navy developed new classes of carriers. Regardless of interservice rivalries between the air force and navy over whether aircraft carriers or land-based bombers were better equipped to drop atomic bombs, Congress offered funding for the navy to build *Forrestal*-class carriers that were capable of launching nuclear attacks and could carry more fuel than World War II-era *Essex* ships. Soon afterward, the first nuclear-powered aircraft carrier, the USS *Enterprise*, was built, ultimately being commissioned in 1961. It would later be utilized in six tours for the Vietnam War. Another example of the United States establishing a military presence in this period was during the Cuban Missile Crisis in October 1962, when President John F. Kennedy sent aircraft carriers to establish a naval quarantine around Cuba.

The Vietnam War proved the flexibility and mobility of aircraft carriers. Presidents Dwight D. Eisenhower and John F. Kennedy sent U.S. aircraft carriers to the South China Sea during their administrations. The use of aircraft carriers escalated in 1964, when the USS *Ticonderoga* and USS *Constellation* were used for strikes in the wake of the Gulf of Tonkin incident. In March 1965, carriers participated in Operation Rolling Thunder. Aircraft carriers were also utilized throughout the war for bombing missions. One major loss in the war occurred in 1967, when the USS *Forrestal* caught fire and killed more than 100 sailors. The damage from this fire also came at a tremendous financial cost, as the cost of repairs was more than 70 million dollars. Even after the war ended, U.S. aircraft carriers retained a presence in the region of Southeast Asia.

Post-Cold War

After Vietnam, the U.S. Air Force developed new aircraft; these new advancements, that is, precision air power, were then tested in Operation Desert Storm. The technological developments of the 1990s occurred amid decreasing defense spending, which led to a decline in the number of deployable carrier battle groups and cut funding for programs. After the development of the nuclear-powered *Nimitz*-class carriers in the 1960s, no new major technological developments were made to aircraft carriers for more than 30 years.

The nature of most post–Cold War conflicts was that of U.S. interservice collaboration and multinational joint operations. In the case of the Persian Gulf War, the U.S. Air Force, Navy, and Marines cooperated in joint operations. America’s global presence was shown through the Gulf War example, as U.S. aircraft carriers were within striking range of Iraq when Saddam Hussein invaded Kuwait and the carriers were capable of being ready for combat within hours. In Operation Desert Storm, the U.S. Navy faced new challenges and discovered that its command and control equipment was unprepared for the organization of large-scale air operations. For example, communication systems were slowed by the small amount of data they could handle and files took hours to be delivered. After the war, the U.S. Navy updated its systems to rectify this problem. When the U.S. Navy decommissioned many ships in the wake of the Persian Gulf War, it retained a more technologically advanced fleet for the 21st-century wars in Afghanistan and Iraq.

Global War on Terrorism

The terrorist attacks on September 11, 2001, again shifted the history of the aircraft carrier. In this new form of global war on terrorism, carriers are increasingly important because of their ability to be readily available to reach remote, landlocked regions. The two major conflicts after these attacks, Operation Enduring Freedom and Operation Iraqi Freedom, offer evidence of the sophistication and advancement of U.S. carrier air power since the Persian Gulf War. Operation Enduring Freedom, which began on October 7, 2001, in Afghanistan, was initially fought primarily with air power from carriers since there were no land bases available with a reasonable proximity to the area. The U.S. Navy showed improvements in naval aviation since the Persian Gulf War through their more precise naval bombing. During Operation Iraqi Freedom in 2003, the navy shifted many of their operations from analog to digital.

In the early 21st century, the U.S. Navy announced a new design called the next-generation carriers, or CVN-21. Set to be completed around 2015, these carriers will have larger decks, improved electrical systems that will lower life cycle costs, and adaptable infrastructure that will adjust to future technologies. Today, aircraft carriers are U.S. territory

that can reach the most remote regions of the world, and they allow the United States to assert their diplomatic and military aims on a global scale. Carriers have proved their flexibility in being utilized for a variety of missions and for diverse types of aircraft, as well as adapting to technological advancements.

AIRLAND BATTLE DOCTRINE

AirLand Battle was a doctrine developed by the U.S. Air Force and Army that leveraged the warfighting competencies from both services in a coordinated manner. This doctrine focused on attacking the enemy’s second and third echelons in depth with both air and ground assets, in addition to fighting along the forward edge of the battle area (FEBA). This entry reviews the developments leading up to AirLand Battle and discusses its features and tenets.

The 1970s: Field Manual 100-5

Following the Vietnam War, the U.S. Army looked to revise its doctrine while providing focus for future operations. In the 1970s, General William DePuy,

commanding general of the army's Training and Doctrine Command (TRADOC), was eager to reorient the army following the humiliation of the U.S. withdrawal from Vietnam and ordered a rewrite of all army publications. As a result of this effort, the army published Field Manual (FM) 100-5 in 1976, which sought to redefine battle and establish a foundation for future army operations. Observing the October 1973 Arab-Israeli War and taking lessons from the battlefield, FM 100-5 framed the concept of "Active Defense," which focused army operations at the FEBA and relied largely on firepower. Focusing on the threat of the Warsaw Pact, FM 100-5 outlined a doctrine that sought to destroy the massive armor columns of the Eastern bloc in the main battle area as they attacked in successive armored echelons.

When published, the 1976 version of FM 100-5 was the subject of much controversy. Critics argued that it focused too much on attrition style, firepower-centric warfare at the tactical level. Additionally, others thought that the concept outlined in 100-5 was too defensive in nature and failed to consider the attributes of movement and maneuver. Commanders also questioned the army's ability to "recock" itself after the first Warsaw Pact echelon was destroyed and before the second and third echelons arrived.

In 1977, General Donn A. Starry succeeded DePuy as the commander of Training and Doctrine Command and began an effort to revise the 1976 version of 100-5 and address the issues raised by its critics. As a corps commander in Europe, Starry thought that U.S. forces needed to expand their scope beyond the FEBA and look at the "extended battlefield." With this extended battlefield concept, Starry believed the army needed to focus on a deeper area of operations, with corps commanders looking to influence an area up to 150 kilometers deep. Instead of defending at the FEBA, the army needed to affect a larger area to defeat the superior numbers of the Warsaw Pact.

To reduce enemy combat power, Allied forces would use deep artillery fires and attack helicopters to reduce enemy combat power before it reached the FEBA. Most important, the army required the support of air power to assist in the destruction/attrition of Warsaw Pact second and third echelon forces. As a result, the air force would contribute to the effort with fixed-wing attack aviation, in what was termed *battlefield air interdiction*. The new concept

held that all echelons of the enemy's assault columns were attacked simultaneously along the axis of advance and not just engaged once they reached the FEBA. Through deep attack, by the time the second and third echelons reached the FEBA, they would already be severely reduced and lack the combat power to continue the assault. Simultaneity of action was the key idea with deep fires creating conditions for victory. In 1982, the army published a new version of 100-5, which introduced this new concept as "AirLand Battle."

Tenets of AirLand Battle

While the new concept expanded the battlefield, AirLand Battle also contained tenets that reshaped the way the army fought. AirLand Battle looked above the tactical level of war and focused on the operational level. The new 1982 version of 100-5 had the army focus less on the main battle area and the tactical-level fight and look at the larger operation within a given theater and not just one single battlefield. The new concept required the integration of air and land power to affect Warsaw Pact forces in and behind the FEBA. This integration required surface fires and air-interdiction assets working in close coordination. The idea of a deep attack was a cornerstone of AirLand Battle and included not only kinetic fires but also inoffensive electronic warfare and deception. As a result, AirLand Battle outlined the rebirth of operational-level art by connecting larger theater-level objectives and incorporating multiple military assets and capabilities in a coordinated effort. In this vein, AirLand Battle was based on better joint operations that required greater synchronization between the air force and the army.

Furthermore, AirLand Battle also required a different mind-set for the individual soldier. Active defense was a methodical battle that did not leverage the individual qualities of Western soldiers. AirLand Battle relied more on a soldier's initiative and expected troops to take action against the enemy when the situation presented itself. The German concept of *auftragstaktik* or mission-type orders was important as soldiers were given the commander's intent without being told specifically how to conduct the mission. Thus, subordinate commanders were free to develop their own plans and methods of attack. As a result, the concept focused not so much on weapon systems and attrition-style warfare but saw leadership

in a fluid environment to be just as important as fire and maneuver. The concept sought to use operational tempo and speed as a weapon.

In August 1990, the Iraqi leader Saddam Hussein's troops invaded Kuwait, and the United States and a coalition force responded to deter an invasion of neighboring Saudi Arabia. The military buildup was known as Operation Desert Shield. By January 1991, it had become clear that Saddam would not withdraw his troops, and Operation Desert Storm began with aerial bombardment of Iraq. When Desert Shield became Desert Storm in 1991, the basic structure of AirLand Battle served as a blueprint for the concept of operation. Deep strikes by air force aircraft, coupled with long-range artillery fire, the multiple-launch rocket system, and attack helicopters, destroyed or reduced Iraqi troop formation before coalition forces crossed the line of departure. The coalition forces utilized deception by staging the 5th Marine Expeditionary Brigade in the Persian Gulf, causing the Iraqis to concentrate much of their defensive power on the shores south of Kuwait City. Electronic warfare jammed Iraqi air defense assets and disrupted command and control capabilities. Last, VII Corps's (the army unit deployed in Desert Storm) sweeping armor envelopment, an offensive maneuver designed to attack the enemy's rear, in the west forced the surrender or withdrawal of Iraqi army elements in short order. By employing deep fires in a coordinated effort along with deception and maneuver at the operational level of war, Iraqi forces were quickly defeated. Many military thinkers affirm that Desert Shield/Desert Storm validated the concept of AirLand Battle and set the stage for future U.S. military operations.

Subsequent to the 1991 victory and as the United States entered the 21st century, FM 100-5 was superseded by FM 3-0, *Operations*, in June 2001. This newer publication still embraced many of the tenets of AirLand Battle by emphasizing joint operations and "Full Spectrum Operations." By specifically addressing these ideas, the United States recognized the value of operational-level synergy, simultaneity, and unity of effort first framed by AirLand Battle. These concepts serve as cornerstones for contemporary military operations.

AL QAEDA

Designated a Foreign Terrorist Organization by the U.S. Department of State, al Qaeda is a militant Islamic organization whose strategic objective is the establishment of a unified state by violence throughout the Muslim world governed according to Islamic law. Forged by Osama bin Laden and other foreign fighters who resisted the Soviet invasion of Afghanistan in the 1980s, al Qaeda is responsible for multiple terrorist attacks around the world dating back to 1992. Culminating on September 11, 2001, 19 al Qaeda terrorists hijacked commercial airliners to crash them into the World Trade Center in New York City and the Pentagon in Washington, D.C. Following the terrorist attacks on September 11, the United States initiated an international counterterrorism campaign with the intent to eliminate al Qaeda and other terrorist organizations. This entry discusses the origin of al Qaeda and examines the terrorist activities of al Qaeda and al Qaeda-inspired terrorists, such as the 9/11 attacks on the United States and bombings across the world.

Origin

Al Qaeda's roots as a terrorist organization grew out of the insurgency that resisted the Soviet invasion and occupation of Afghanistan in the 1980s. During the Afghan war, bin Laden, a Saudi Arabian born into a wealthy Yemeni family, helped finance, recruit, transport, and train Islamic foreign fighters to expel the Soviet Army. Bin Laden and his associates believed that the Soviet defeat at the hands of the Afghan resistance was an Islamic victory over one of the world's two super powers. Fueled by this

victory, bin Laden hoped to redirect the fight toward overthrowing regimes deemed “non-Islamic” and expelling Westerners and non-Muslims from the Muslim countries.

The invasion of Kuwait by the Iraqi army in 1990 would offer bin Laden a chance to reunite the victorious resistance fighters from the Afghan war to defend Saudi Arabia. Despite his favorable reception by the royal family, the Kingdom of Saudi Arabia rejected bin Laden’s offer of fielding an Islamic Army of Afghan veterans in favor of a U.S.-led coalition. Entrusting the defense of the cradle of Islam and its two holiest cities, Mecca and Medina, to non-Muslims infuriated bin Laden. This fermenting rage against apostate regimes, like the Saudi Royal Family, spurred bin Laden to exercise the lessons learned in the Afghan war to recruit, train, and finance Muslim fighters to begin the violent expulsion of the United States from the Islamic world in order to establish a unified state throughout the Muslim world governed according to Islamic law.

When bin Laden began recruiting fighters in Saudi Arabia, the royal family exiled him. At the invitation of an Islamic cleric and political figure, Hassan al-Turabi, bin Laden was granted safe haven in Sudan, where he would work to raise money and train Islamic fighters for conflicts in the Balkans, Chechnya, Kashmir, and the Philippines. In Sudan, he would expand his wealth through the ownership of Sudan’s most profitable businesses, including construction, manufacturing, currency trading, import-export, and agricultural enterprises. During his time in Sudan, a number of terrorist attacks against U.S. targets began to be credited to bin Laden pressuring the Sudanese government to broker his return to Afghanistan.

Offering financial support to their militia, bin Laden returned to Afghanistan in 1996 under the protection of the Taliban government. In Afghanistan, bin Laden found himself in the company of other Muslim exiles, specifically Dr. Ayman al-Zawahiri, the founder of the Egyptian al Jihad group, and Mohamed Atef, a veteran guerrilla commander. Under the religious and political tutelage of Zawahiri, bin Laden issued an Islamic edict, “Declaration of Jihad on the Americans Occupying the Country of the Two Sacred Places,” promising violent action against the Americans unless they withdrew from Saudi Arabia. Through his wealth and a system of training camps, bin Laden would form an army of Islamic fighters to carry out violence against the United States. Backed by this army

of several thousand and endorsed by other Islamic terrorist groups, bin Laden would issue another Islamic edict in February 1998 under the banner of the World Islamic Front titled “Statement of Jihad against Jews and Crusaders,” saying it was the duty of all Muslims to kill U.S. citizens, civilian and military, and their allies everywhere. This edict would initiate al Qaeda’s global campaign of violence and propaganda against secular Muslim regimes and Western occupiers of Islamic lands. Al Qaeda’s objectives included the following: returning to a “pure and authentic” Islam as practiced by the Prophet Mohammed in order to bring back glory and prominence to Muslims, overthrowing regimes deemed to be non-Islamic, expelling Westerners and non-Muslims from Muslim countries, and establishing a unified state throughout the Muslim world governed according to Islamic law by working with a network of like-minded Islamic militant organizations.

Activities

Al Qaeda initiated its global terrorist campaign on August 7, 1998, with simultaneous attacks on the U.S. embassies in Kenya and Tanzania killing 224 people. The U.S. retaliated on August 20, 1998, with guided missile strikes against suspected training camps in Sudan and Afghanistan. Subsequently, the U.S. State Department would designate al Qaeda as a Foreign Terrorist Organization in December 1999. In October 2000, al Qaeda targeted the USS *Cole*, docked in the port of Aden, Yemen, killing 17 U.S. sailors and injuring 39 others. In its most devastating attack, 19 al Qaeda terrorists simultaneously hijacked four commercial airliners to crash them into the World Trade Center in New York City and the Pentagon in Washington, D.C. (the fourth airliner crashed in the Pennsylvania countryside following assaults on the hijackers by passengers). According to the *9/11 Commission Report*, these attacks resulted in the deaths of 2,973 people from more than 70 countries, including the 343 firefighters and 60 police officers who responded to rescue those trapped in the World Trade Center. In response to these attacks, the U.S. would launch the “Global War on Terrorism” to eliminate al Qaeda and its safe havens through military campaigns in Afghanistan and elsewhere.

In March 2003, the U.S.-led military coalition overthrew the Iraqi regime of Saddam Hussein in

response to the regimes' violation of 16 UN Security Council resolutions targeting its weapons of mass destruction program. The ensuing occupation of Iraq by coalition forces would spur an insurgency that would mimic the Afghan War of the 1980s and attract foreign fighters to expel yet another Western military in a Muslim country. One particular Jordanian militant, Abu Musab al-Zarqawi, whose operations wreaked havoc in Iraq, pledged allegiance to bin Laden in 2004, establishing al Qaeda in Iraq.

With its central leadership in disarray due to U.S. military operations in Afghanistan, 2004 would mark a change in the operations of al Qaeda. In March 2004, 3 days before Spain's general elections, commuter trains in the capital of Madrid were targeted by al Qaeda-inspired terrorists, killing 191 people and injuring 2,000. While not directly sponsored by al Qaeda, the Madrid bombers would mark the transition of al Qaeda as an organization to an ideology. Inspired by al Qaeda's ideology of violent extremism, the Madrid bombers succeeded in influencing the Spanish elections that would result in the withdrawal of Spanish forces from the coalition in Iraq.

Al Qaeda's trademark simultaneous terror attacks would be employed again by Muslims emboldened by the teachings of bin Laden and angered by British involvement in the Iraq War. On July 7, 2005, four al Qaeda sympathizers would detonate bombs targeting the London public transportation system, three on underground trains and one on a bus. Fifty-two people were killed, and 700 were injured in the attacks.

Despite their failures, several attempted terror attacks linked to al Qaeda could have had devastating effects. In December 2001, Richard Reid tried to detonate a shoe bomb on a flight from Paris to Miami. In August 2006, 24 British citizens linked to al Qaeda plotted to blow up 10 planes using liquid explosives. In June 2007, British police discovered two car bombs in London that al Qaeda-linked perpetrators failed to detonate; a third vehicle burst into flames at Glasgow Airport the following day when terrorists attempted to explode its bombs. In December 2009, a Nigerian man attempted to detonate a bomb in his underwear on a flight from Amsterdam to Detroit; the alleged bomber admitted his link to al Qaeda. In October 2010, British authorities thwarted a plot by Yemenis linked to al Qaeda, who concealed two bombs inside computer printers transiting the United Kingdom aboard planes bound for the United States.

Al Qaeda as a network of global Islamic terror organization is linked to various other terrorist attacks. An October 2002 bombing of nightclubs in Bali, Indonesia, killed 202. November 2005 bombings at American hotels in Amman, Jordan, killed 57. Al Qaeda in the Islamic Maghreb claimed responsibility for the deaths of 60 people in two suicide attacks at UN offices in Algiers, Algeria. Baitullah Mehsud, an Afghan Taliban leader with ties to al Qaeda, assassinated former Pakistani Prime Minister Benazir Bhutto in December 2007 in Rawalpindi, Pakistan. In June 2008, a car bomb exploded outside the Danish Embassy in Pakistan, killing six; al Qaeda claimed responsibility as retaliation for political cartoons depicting the Islamic prophet Muhammad.

Organization

Terrorism experts characterize al Qaeda's organization as a venture capital firm; al Qaeda provides funding, contacts, and expert advice to various militant groups and individuals all over the Islamic world. It used its safe haven in Afghanistan as a base to centrally plan and coordinate terrorist operations around the world. From these training camps, al Qaeda created a network of geographically dispersed cells and individuals equipped with a wide array of relevant terrorist skills. Weapons training, surveillance, covert reporting, physical training, and false document production were combined with fundamentalist Islamic training. Al Qaeda's training emphasized self-sufficient operations where terrorist cells could operate independent of central command and control. In its early years, it is suggested that al Qaeda trained more than 5,000 fighters in its Afghanistan training camps. These fighters were led by a hierarchical leadership and decision-making body known as the consultative council. This council was a vertical leadership structure providing strategic direction and tactical support to a horizontal network of compartmentalized cells.

As result of the military, intelligence, and law enforcement operations in support of the Global War on Terrorism, al Qaeda's core capacity for conducting large catastrophic operations has been assessed by intelligence officials to have been degraded. Estimates suggest that an al Qaeda core of several thousands has dwindled to nearly a hundred. Nearly half of the core al Qaeda senior leadership has been killed or captured. However, the former

director of the Central Intelligence Agency, George Tenet, warned of a transition into an autonomously operating collection of regional networks infected by al Qaeda's violent agenda. Al Qaeda has evolved into an ideology, with bin Laden and his deputy Zawahiri playing significant roles as propagandists who exploit modern mass communications.

In the forefront of this transition was the terrorist group al Qaeda in Iraq. Al Qaeda in Iraq was one of the more successful branches of al Qaeda from 2004 to 2007 during the insurgency following the U.S.-led invasion of Iraq in 2003. Led by al-Zarqawi, al Qaeda in Iraq was formed primarily of fighters from neighboring Islamic countries who targeted the U.S. military, Iraqi civilians, and foreign workers with marketplace bombings, kidnappings, beheadings, improvised explosive device ambushes, and urban guerrilla warfare. Al Qaeda in Iraq's operations also marked the rise in al Qaeda's propaganda machine as a tactic in its violent struggle; the group extensively employed videodiscs, audiotapes, and the Internet to disseminate images of its dramatically choreographed terror attacks to the world.

Al Qaeda in the Arabian Peninsula was formed by veterans of the Afghan war against the Soviets who fled Saudi Arabia to Yemen. This branch of al Qaeda has been responsible for suicide bombings, shootings, kidnappings of foreign civilians, and several failed bombing attempts targeting commercial passenger and cargo airplanes.

Al Qaeda in the Islamic Maghreb is a pseudo-branch of al Qaeda based in North Africa. It is unclear whether this branch takes direct orders from the al Qaeda leadership or merely espouses its ideology and acts independently in its region of influence. In a similar vein, Islamic terrorist groups in Southeast Asia, notably the Abu Sayyaf Group and Jemaah Islamiyah, are sympathetic to the cause, and their operatives received training and funding at al Qaeda camps in Sudan and Afghanistan.

Death of Osama bin Laden

On Monday, May 2, 2011, the United States launched a raid against a compound in Abbottabad, Pakistan, codenamed Operation Neptune Spear. The raid, carried out by 79 commandos, pilots, tactical intelligence collectors, and a dog from the U.S. Joint Special Operations Command, ended in the death of the al Qaeda founder and leader.

At the conclusion of the raid, U.S. forces took bin Laden's body to Afghanistan for forensic identification before burying it at sea within 24 hours of his death. In the exploitation of the compound, U.S. personnel removed 2.4 terabytes of computer hard drives, documents, DVDs, thumb drives, and "electronic equipment" for later analysis.

ALLIANCES

Alliances are diplomatic or military arrangements made between nation-states, either formally or informally, to increase cooperation for security from outside aggression. Alliance building has maintained a large presence in the history of sovereign states from ancient history, a prime example being the Delian League of ancient Greece, to the modern period, the North Atlantic Treaty Organization (NATO) being the best modern example of an alliance system at work. Alliances were traditionally viewed by policymakers as essential tools to maintain a balance of power between competing states and are still seen in this light in today's global society. This entry describes some basic characteristics of alliances and their historical development over the course of the 20th century.

Characteristics of Alliances

Alliances often share several basic characteristics. First, alliances seek to enhance the power of the individual state while also helping to stabilize the international order. A prime example of this characteristic were the alliances put into place by Otto von Bismarck in the aftermath of the Franco-Prussian War of 1870–1871,

most notably the Dual Alliance in 1879 and the Triple Alliance in 1882, to help strengthen the new German state's position in Europe as well as to provide a counterbalance to any renewed French attempts to regain what had been lost in the 1870–1871 conflict. Second, alliances provide for the restraint of allies. This function has often been one of the most important of alliance systems, particularly in ensuring that the actions of one ally state do not endanger the security or jeopardize the interests of another.

Alliances can also be defined by their specific attributes. Alliances can be categorized by type (e.g., military), membership (bilateral or multilateral), class (offensive, defensive, or nonaggression), and scope (regional or international). For example, the ANZUS Treaty signed in 1951 between the United States and Australia and Australia and New Zealand represents a multilateral, defensive, military, regional alliance structure. These attributes are, however, not immutable and can change given circumstances and the needs of individual states involved.

Alliances are also often based on shared interests between individual states and an exchange of benefits. This is not to say, however, that each alliance represents equality between member states. Often one member state can be seen as the dominant force in the alliance relationship owing either to its military or to its economic strength. This is especially true in bilateral alliances such as ANZUS, where the United States maintains a position of control in the alliance.

Alliances are also often based on some form of ideological solidarity between the member states. These ideological ties can be central to the alliance structure, such as the anticommunist nature of the Southeast Asia Treaty Organization (SEATO), or they can provide only a loose connection between the allying states, such as the 1940 Tripartite Pact between Nazi Germany, Fascist Italy, and Imperial Japan. Alliances have maintained their importance in modern foreign policy making and still represent one of the principal actions individual nations carry out to provide security from external threats as well as internal security.

Alliances and World War I

Alliances prior to 1914 had generally been flexible and were created to achieve limited aims. Many of the alliances struck between European nations in the 18th and 19th centuries were principally aimed at maintaining a balance of power between the states of

the continent. They were, in other words, designed to fragment military power rather than to concentrate it. However, increased tensions between the major powers of Europe in the early 20th century, spurred on by a naval arms race between Great Britain and Germany, growing nationalism in the Balkans, and the quest for colonies, helped transform the alliance system from one designed to prevent war to one that actually increased the chances of war beginning.

World War I saw the major powers of Europe divided into two major alliance groups—the Triple Alliance and the Triple Entente. The Triple Alliance (1882–1914) was a defensive alliance between Germany, Austria-Hungary, and Italy. This categorization of the alliance as defensive was the primary reason why Italy did not formally enter the war on the side of its alliance partners in 1914 since it was deemed that Germany and Austria-Hungary had initiated the fighting. During the war, the Ottoman Empire would replace Italy as the third member of the Triple Alliance. The Triple Entente was composed of France, Russia, and Great Britain (1907–1917) and was affiliated with Japan and the United States during the war, although neither nation was ever a formal member of the Triple Entente alliance system. Both alliance systems were premised on the idea of allied states coming to the aid of their alliance partners in the event of the outbreak of hostilities. This negated the freedom of action for each of the individual states and created a highly unstable state of affairs. The rigid nature of the alliance system that had been created by 1914 virtually ensured that even the most minute diplomatic disruption would lead to conflict between the great powers, which is what occurred with the outbreak of hostilities between Austria-Hungary and Serbia in the aftermath of the assassination of the Austro-Hungarian crown prince, Franz Ferdinand, on June 28, 1914. The alliance machinery brought Germany into support of its ally, which necessitated a response from Russia, thereby triggering France's alliance obligations to its partner. World War I appeared to many observers to have been an almost unavoidable conflict, given the nature of the alliances that had been built in the 30 to 40 years prior to 1914.

The Grand Alliance and World War II

The similarities between the alliance systems of World War I and World War II are marginal at

best. The alliances of 1914 were codified in a way that the alliances between the major powers that took part in World War II never were. The Grand Alliance between the United States, Great Britain, and the Soviet Union was more loosely centered on an ideological opposition to the totalitarian governments of Nazi Germany, Fascist Italy, and Imperial Japan than on a traditional balance-of-power model. Another important difference was that the Grand Alliance was the product of the war itself rather than the alliance being a precipitating factor in the conflict, as had been the case in 1914. Prior to 1941, many in the American diplomatic and military policy-making establishment considered the Soviet Union to be no different from Nazi Germany and, in some instances, an even greater threat. The most basic expression of the aims of the Grand Alliance was outlined in the Atlantic Charter drafted by President Franklin Roosevelt and Prime Minister Winston Churchill during the Atlantic Conference (August 9–12, 1941). The eight points of the statement issued by the two leaders focused the ideas of self-determination, lowering of economic barriers, and disarmament after the war had concluded. The Atlantic Charter would become the basis for what became popularly known as the United Nations during the war, the broad alliance of nations engaged in the war against the Axis Powers, and would provide the starting point for several of the important post-war international organizations, such as the United Nations and the General Agreement on Tariffs and Trade, to name a few.

While the Atlantic Charter provided an underlying rationale for the Grand Alliance, the machinery of fighting the war generally fell to the Combined Chiefs of Staff (CCS), composed of the British Chiefs of Staff Committee and the American Joint Chiefs of Staff. This represented another important differentiation between World War I and World War II. With the CCS, the United States and Great Britain created a tightly integrated command and staff structure to formally coordinate military operations and the allocation of war materiel. The overarching Grand Alliance was a much looser association between the Big Three and more closely mirrored the looser alliance that the Allied powers had at the end of World War I. The CCS was formed in February 1942 to facilitate closer planning between American and British military forces and to prepare plans for the eventual invasion of continental Europe. The roots

of the CCS came out of joint American-British talks held between January and March 1941 and the Arcadia Conference (December 22, 1941 to January 14, 1942), held in Washington, D.C. The CCS generally only fully met during wartime conferences such as Casablanca or Teheran. During other periods, the British military was represented by its Joint Staff Mission permanently situated in Washington. Notable figures involved with the CCS include the U.S. general George C. Marshall and the British field marshal Sir John Dill.

While the CCS oversaw the development of global Allied strategy, regional commands became the lowest level expression of the Grand Alliance. These regional commands blended military, diplomatic, and political concerns and were placed under the overall command of a supreme commander. The first such attempt at creating a combined regional command occurred in early 1942 with the formation of the American-British-Dutch-Australian Command (ABDA) to deal with the threat of Imperial Japan in Southeast Asia and the Dutch East Indies. ABDA was placed under the overall command of the British general Sir Archibald Wavell. ABDA was only in existence for several weeks and failed to stem the tide of the Japanese advance, but it provided a useful blueprint for the creation of future Allied regional commands. Prominent successors to ABDA included in Europe the Supreme Headquarters Allied Expeditionary Force (SHAPE), commanded by the U.S. general Dwight Eisenhower; the Southwest Pacific Area (SWPA), commanded by the American general Douglas MacArthur; and the South East Asia Command (SEAC), under the overall command of the British admiral Lord Louis Mountbatten as Supreme Allied Commander.

World War II was a seminal event for the United States in understanding the importance of alliance building. Prior to 1941, the United States had often acted as a unilateral power in world affairs. Even during World War I, President Woodrow Wilson had decided that the United States would be an “Associated Power” rather than a formal “Allied Power.” When the war ended in 1945, a whole new generation of American diplomatic and military leaders had gained firsthand practical experience in alliance building. This new skill set would immediately be put to the test as tensions between the Western powers, primarily the United States and Great Britain, and the Soviet Union grew

dramatically even before the final shots of World War II had been fired.

Alliances and the Cold War

The ideological struggle between the United States and the Soviet Union in the 45-year period after World War II became the primary factor in the formation of alliances globally. Both sides sought, much as Otto von Bismarck had after the Franco-Prussian War, to enhance their own individual security while trying to limit the growth of their opponent's power. Coming out of World War II, American leaders recognized that the conventional strength of Soviet military power represented a distinct threat to Western Europe. To counter this, American and Western European leaders turned to the creation of a series of mutual defensive alliances to serve as a potential deterrent to Soviet aggression. The first step toward the creation of an alliance network to contain Soviet power occurred in 1948 with the signing of the Brussels Pact between Great Britain, France, and the Low Countries. This was a multilateral, mutual defensive alliance designed to act as a bulwark against communism in postwar Western Europe as well as against the possibility of a resurgent Germany. The Brussels Pact was envisioned as being a purely European affair. However, as the division of Europe between the Western Powers and the Soviet Bloc became more stark, members of the Brussels Pact, in particular the British, became more alarmed about the ability of the western European nations to stand up against Soviet military power. It was suggested that the Brussels Pact be expanded to become a more Atlantic focused organization, thereby bringing the United States into the equation of western European defense. This move by the western European powers found a receptive audience with American policymakers. In the aftermath of U.S. involvement in the Greek civil war in 1947 and the issuance of the Truman Doctrine, the United States had taken on a much more hard-line attitude toward dealing with the Soviet Union.

Talks between the Brussels Pact nations and the United States and Canada began almost immediately after the signing of the Brussels Pact. On April 4, 1949, the North Atlantic Treaty was signed between the United States, Canada, the five Brussels Pact nations, and Iceland, Spain, Portugal, Italy, Norway, and Denmark. This became the foundation for the

creation of the North Atlantic Treaty Organization (NATO). Key to NATO was the inclusion of a mutual defense clause that treated an attack against any one member as an attack against all member nations. However, at American insistence, it was decided that each member nation would be able to decide the level of support it would offer rather than being locked into any single course of action. Admittedly, NATO also helped further fuel the Cold War between the Western Powers and the Soviet Bloc. In response to NATO, the Soviet Union in 1955 formed the Warsaw Pact, a mutual defensive alliance system of the Soviet Union and its seven Eastern European satellite nations.

The 1950s saw alliances take on a central role in American Cold War policy during the administration of President Dwight Eisenhower. One of the principal focuses for Eisenhower was controlling the blossoming American military budget. Along with his secretary of state, John Foster Dulles, Eisenhower introduced what was known as the New Look defense policy. The New Look placed increased emphasis on America's atomic arsenal to offset Soviet conventional strength. An equally important aspect of the New Look was an increased focus on the creation of alliance systems to hem in the growth of Soviet power. This focus led to the Eisenhower era being known as a period of "pactomania," with the United States concluding 42 separate alliances during Eisenhower's 8 years in office. Some of the alliances struck in this period continue to form important relationships for the United States today, such as the 1951 ANZUS alliance with Australia.

Not every alliance created by the United States and the Western Powers during the Cold War proved to be as effective as NATO or ANZUS. A prime example of an ineffective alliance was the Southeast Asia Treaty Organization (SEATO), created in 1954. This was intended as a collective defensive alliance system between Western Powers such as the United States and Great Britain and regional nations such as Thailand, the Philippines, and Australia. SEATO was created to become a Pacific version of NATO in that it was primarily intended to contain the spread of communism in Southeast Asia, in particular to isolate Communist China. However, this was the end of the comparison between the two alliance systems. SEATO did not provide for a clear, coordinated response from member nations in the event of an attack on a member nation in the same way

that NATO did. A joint, unified command structure, like NATO's, was never created, and most member nations contributed little in the way of military support to the alliance. This led to SEATO being ineffective almost from the moment of its inception. SEATO's first major litmus test occurred during the 1960–1961 Laotian civil war. Internal disagreements over the appropriate level of response from SEATO members led to the alliance doing nothing. This demonstrated the impotence of the system in meeting its stated goals of providing security from communist aggression in the region. SEATO's major contribution was that it provided one of the rationales for increased American unilateral military involvement in Southeast Asia after 1960, particularly in Vietnam.

Alliances in the Post–Cold War Era

Through the end of the 20th century, the alliance systems created by the United States and the former Soviet Union remained in place and acted as one of the primary ways by which nations identified themselves. One prominent example that ran counter to this was the temporary alliance arranged by President George H. W. Bush and Secretary of State James Baker to challenge the Iraqi invasion of Kuwait in 1991. American leaders made it clear that they would act only in concert with a broad array of both traditional and regional partners. This led America into cooperation with nations previously at odds with American policy in the Middle East, such as Syria, as well as restraining its traditional ally Israel from acting to upset the delicate nature of this temporary alliance system.

However, the rapid collapse of the Soviet Bloc in the early 1990s was the central issue to many among the Western Powers and raised the question of whether or not the alliance systems of the Cold War era remained a necessity. Events in the 1990s, though, supplied a new rationale for the continued existence of the most important Cold War alliance system, NATO. In 1999, NATO undertook a sustained bombing campaign to halt the ethnic conflict in Kosovo. NATO's stated goal was to force Serbian forces, seeking to forcefully retain Kosovo, out in order to allow UN peacekeeping forces to move into the region. The bombing campaign, coupled with the unwillingness of Russia to come to the aid of

Serbia, led to the acceptance of a cease-fire in June 1999 and the establishment of a UN peacekeeping force, mingled with NATO forces, in Kosovo.

NATO also maintained its importance for American diplomatic and military policy in the aftermath of the terrorist attacks against the United States on September 11, 2001. In the aftermath of the attacks, NATO invoked Article 5 of the alliance, which stated that any attack against one member represented an attack against all members and that the United States could rely on the support of NATO nations after it was shown that the attack had originated from abroad. In October 2001, the North Atlantic Council, the main decision-making body of NATO, determined that the attacks by al Qaeda satisfied this requirement since the terrorist organization was being sheltered by the Taliban regime in Afghanistan. This decision provided the rationale for NATO support for the U.S. invasion of Afghanistan, although the alliance did not take a lead role in the military operations as it had in Kosovo.

NATO demonstrates the continued importance of alliances to nation-states in today's world. It continues to be a cornerstone of American diplomatic and military planning in world affairs and remains the most successful of the alliances struck in the 20th century.

ALL-VOLUNTEER FORCE

Concurrent with the ending of conscription in 1973 by the United States was the development of the all-volunteer force (AVF), which depends on individual voluntary enlistment to fill the ranks of the military. While the United States relied wholly or partially on conscription to fill the military during the World Wars and from 1948 until 1972, the United States traditionally relied on voluntary enlistment. Opposition to the war in Vietnam and to the inequities in the conscription system ended the national consensus on conscription and brought a return to a completely volunteer military. This entry discusses the evolution of the U.S. AVF from 1969 to the present.

Background

In March 1969, President Richard M. Nixon created the Commission on an All-Volunteer Armed Force, with the former secretary of defense Thomas Gates as chair, to study the plausibility of ending conscription and, instead, relying solely on volunteers. While some board members had reservations about the possibility of relying on volunteers during wartime, the committee believed that maintaining a peacetime military with volunteers was possible and even desirable. The committee reasoned that the large population of the United States made universal military service unnecessary and impractical and, as a result, conscription placed a large burden on a relatively small percentage of the population. Additionally, the mounting discipline problems among draftees, especially in the U.S. Army, led some army leaders to seek a different means of acquiring soldiers. The committee reported that the military could be sufficiently manned only if volunteer recruits were enticed with higher pay and other reforms.

In 1971, President Nixon signed legislation establishing the AVF. That September, Congress extended the government's authority to draft into 1973 but at the same time began to substantially increase military pay. The increases were especially felt in the lower enlisted grades, the grades held by most conscripts and first-term enlistees. All branches were apprehensive about ending conscription. Very few senior military officers in the early 1970s had ever served in the military without a draft. Although most draftees served

in the army, the draft spurred voluntary enlistments into the air force and navy. Additionally, the reserves of each branch, including the National Guard, were fully manned through the negative incentive provided by the draft, since service in the Guard or Reserves made a man ineligible for conscription.

Despite the preparations laid for the AVF, recruitment proved difficult throughout the remainder of the 1970s. The branches, especially the army, contracted with professional advertising firms to sell the military as a career option. The military began offering incentives to entice young men, such as the new Montgomery G.I. Bill, and programs, such as the Army College Fund, in an attempt to lure single-term soldiers. The services also began to target minorities and women for recruitment, groups not previously courted for military service.

Following the 1979 collapse of détente (the period during the Cold War when there was a “thaw” in the strained Soviet-U.S. relations), President Jimmy Carter received from Congress a reinstatement of registration with Selective Service by men between 18 and 25 years of age, although no resumption of conscription took place. Congress has since periodically debated abolishing registration and cutting all funds for Selective Service or, alternatively, reinstating conscription.

During the administration of Ronald Reagan (1981–1989), the military more fully adapted to the AVF. Much of the Reagan defense buildup went for quality-of-life issues, such as improved pay and better base facilities, and in general for making military service an attractive career for enlisted people, rather than just something to be endured for a few years. Many of the barracks built between 1940 and 1943, with a projected usable life span of about 6 years, were finally torn down and replaced with more modern housing, which resembled college dormitories more than traditional barracks. Such changes would continue into the 21st century, with the implementation of programs such as the army's Better Opportunities for Single Soldiers, which aimed at ending the large gulf in off-duty life experience by married soldiers and single soldiers who lived on post.

Total Force Policy

Foreseeing a drop in active-duty soldiers after the switch to the AVF, the army began a major reorganization, dubbed the Total Force Policy, that would

force mobilization of some of the reserve components in the event of a large war. Divisions included one brigade from the Army National Guard, which allowed the army to maintain 16 divisions after the end of the draft. Some support functions were placed mainly or wholly in the Army Reserve, freeing up more positions in the Regular Army for combat arms.

One of the more controversial trends since the end of the draft has been the increased dependence on private contractors to provide many functions once performed by soldiers. This dependence has been especially pronounced since the end of the Cold War in 1990. Functions from providing meals to teaching Reserve Officers' Training Corps to providing security at bases have increasingly been contracted to civilian firms. While contractors lessen the need for soldiers for mundane tasks, they have only the right to self-defense, and if they participate in actual combat, they lose any legal protection given to military personnel in a combat zone under the Geneva Conventions.

Most analyses of the AVF agree that it has been a success, especially after its first decade. Despite a wide public perception that the quality of recruits dropped under the AVF, the average soldiers in the AVF are better educated, are more physically fit, and have fewer legal problems than their civilian counterparts. The percentage of enlisted soldiers with high school diplomas rose from 45% in 1973 to more than 90%. Only about 10% of enlistees come from the lowest income bracket, while 50% of enlistees come from middle-income families. The framers of the AVF envisioned a mixture of single-term and career soldiers; the trend has been toward more career soldiers. Despite initial misgivings about depending on the AVF during war, the war that began in 2001 has been fought using the AVF. Recruiting became more difficult in the first years of the war, but increased benefits and a declining economy assisted in allowing recruiters to meet quotas. At the same time, retention rates remained high, allowing the military to man its units.

AMBUSH

An ambush is a deliberate attack designed to utilize the element of surprise in delivering concerted and coordinated fire from concealed positions on an enemy in a position that affords him little opportunity to protect himself or return effective fire. Depending on the terrain and time afforded to the attacker, an ambush can be organized hastily or as a deliberate and well-organized attack. Positions with various responsibilities are assigned when setting an ambush, and a design is made as to how the ambush will be initiated so as to ensure the element of surprise. An ambush is initiated when the enemy crosses into the kill box of the ambush, the area that allows the ambush to deliver the most effective fire on the enemy.

An ambush is ideally set on terrain that either forces the enemy across open or restricting terrain or affords the attacking force advantageous terrain. When properly set and executed, an ambush can be the most effective tactic utilized by an attacking force seeking primarily to destroy an enemy force. It inflicts the most casualties on the enemy while ensuring that only minimal casualties are sustained by the attacker. While missions, time, and terrain do not always allow for an ambush to be set, any opportunity to do so will dramatically increase the attacker's probability of success. This entry describes the types of ambush, elements of an ambush, and ambush formations.

Types of Ambush

Ambushes are broadly categorized as either near or far ambushes. A near ambush is generally classified as one that places the opposing forces within hand grenade range from one another. The advantage of a near ambush is that it allows for effective small arms fire to be concentrated on the enemy. The disadvantage is that it places the ambushing force in a position that allows

the enemy to react more easily and inflict casualties on the attacker. A far ambush takes place out of hand grenade range with the enemy. It permits the use of indirect fire assets (mortars and artillery) on the enemy from a greater distance so as not to allow the enemy to effectively react to the ambushing force. Near and far ambushes can be combined to deliver both direct and indirect fire onto the enemy.

Elements of an Ambush

Any type or formation of ambush generally includes three elements to carry out various tasks during the setting and executing of the ambush: (1) the assault, (2) support, and (3) security. The assault element initiates the ambush by fire, assault, or a combination of the two. The support element is responsible for fixing—maintaining—the enemy in the kill zone. It is important to fix the enemy in the kill zone so as to allow the ambush to effectively engage and destroy its targets. The support element can also be responsible for calling indirect fire assets onto the enemy in the kill zone. Depending on how the ambush is initiated, the assault and support elements may work in concert with one another. Once the ambush has reached the limits of its effectiveness and destroyed as much of the enemy force as possible, the objective can be secured. Once this is done, the assault and support elements can conduct treatment of casualties and prisoners and can carry out any other actions essential for the objective. The security element protects the area around the ambush and provides a secure area for the other two elements to function within. It can also be responsible for protecting an avenue of withdrawal or an objective rally point. In essence, the security element is the most important as it protects the integrity of the ambush as a whole.

Ambush Formations

When preparing an ambush, the situation dictates how the elements of the ambush will be placed. A deliberate ambush can be placed when a position has been predetermined and enough time is afforded. When the enemy has already been sighted, a hasty ambush must be effected, thus limiting the preparedness and consequent effectiveness of the ambush. A number of ambush formations can be employed.

The linear ambush is formed parallel to the enemy's path of travel. The support and assault

elements are arranged side by side and produce a flanking fire into the kill zone.

The L-shaped ambush is formed along a bend in the enemy's path of travel, ideally a road, path, or stream. The support and assault elements each occupy a leg of the angular position and produce both flanking fire, or fire delivered on an enemy flank from a position to the side of that enemy, and enfilading fire, in which weapons fire can be directed along the longest axis of a formation, into the kill zone.

The V-shaped ambush is formed when the assault and support elements deploy on opposite sides of the enemy's path of travel, forming a V. This ambush is capable of producing both enfilading fire and interlocking fire or crossfire.

Terrain and enemy activity are the primary considerations for leadership when dictating ambush formations.

AMERICAN BATTLE MONUMENTS COMMISSION

The American Battle Monuments Commission (ABMC), established by Congress in 1923, is an agency of the executive branch of the federal government. Eleven commissioners appointed by the president form the policy-making body of the organization, whose commemorative mission includes designing, constructing, operating, and maintaining permanent American cemeteries in foreign countries; establishing and maintaining U.S. military memorials, monuments, and markers overseas where American armed forces have served since April 6, 1917, and within the United States when directed by public law; and controlling the design and construction of permanent U.S. military monuments

and markers by other U.S. citizens and organizations, both public and private, and encouraging their maintenance. This entry discusses the history and activities of the ABMC.

World War I

American war losses were substantially less than those suffered by other nations during the First World War, with total overseas casualties for all service branches documented at 116,516, including other-than-battle deaths, such as flu victims. In 1917, policymakers decided that those who died in Europe would be interred there, and no attempt would be made to return their bodies to the United States until after the close of hostilities. Consequently, in the war's aftermath, the U.S. Army's Graves Registration Service was left to identify, exhume, and register burials in more than 2,000 cemeteries across the Western Front, where the dead had been temporarily buried. Many of the war dead lay in isolated graves, and some were never found, while others were completely destroyed during battle, resulting in a search and reburial process that continued for years.

When the armistice was signed in 1918, it brought an end to the horrific 4-year global conflict, and with it came rapid and unexpected change to the United States. This transformation left political officials, the military, and the public unprepared and vaguely reluctant to accept the enlarged role the United States would play in postwar international affairs; it also raised uncertainty as to how best to memorialize the recent war. A result of this collective ambivalence was the reconfiguration of traditional remembrance practices as new rituals were created to more closely respond to a changing society.

Even before the armistice, attempts at collective memorialization began to flourish across the former battlefield as American military units improvised hastily built monuments of field stones and concrete to mark their campaigns. However, they became an inconvenience to French farmers, and without maintenance, most quickly deteriorated. Once peace was formally declared, military officials methodically researched and marked the American Expeditionary Forces' achievements, anticipating future commemorative plans. By 1920, the need for central supervision of overseas memorials was evidenced by the large number of markers that overrepresented some divisions, while other units went unrecognized. Moreover, the army's battlefield researchers claimed

that the historical accuracy of these markers was highly questionable. In the absence of any regulatory body, it was feared that a haphazard arrangement of monuments, similar to those erected on the Civil War landscape at Gettysburg, would be repeated.

Most agreed that something had to be done to memorialize the war and its human cost, and although memorialization was proceeding on local and state levels within the United States, there was no consensus as to what form the overseas remembrance should assume. The war's achievements remained ambiguous to many Americans, and distant battlefields meant restricted access to the traditional sites of mourning and remembrance. Moreover, the War Department's eventual decision to repatriate the identified war dead, at the request of next of kin, had resulted in scattered burials both in the United States and overseas, in private and national grounds, essentially contributing to fading memories of the war.

To remedy the situation, President Warren G. Harding signed the bill into law that created the American Battle Monuments Commission on March 4, 1923. John J. Pershing assumed chairmanship over the new organization, which was appointed to initiate and oversee the construction of a grand scheme of national monuments on the former battlefield. A republican senator, a Gold Star Mother, and three civilians (each representing the national veterans associations) completed the commission's early membership, along with one active-duty military officer who served as secretary.

Throughout the 1920s and into the following decade, the ABMC worked in consultation with the Commission of Fine Arts and several leading architects of the period to construct an American landscape of national cemeteries and monuments in several locations across Europe. The result merged remembrance of the dead with foreign policy objectives that alluded to the ascendancy of America's power and the glory of its victorious armies. In 1934, a presidential executive order transferred the eight World War I cemeteries to the ABMC and made it responsible for the design, construction, operation, and maintenance of future permanent American military burial grounds on foreign soil.

World War II and the Cold War

The victory and peace commemorated after what was termed *the war to end all wars* would prove fleeting, and by 1941, the United States was drawn

into another world war that would result in 405,399 American casualties. As in the previous war, the dead were found buried in hundreds of temporary military cemeteries. Once peace was declared in 1945, permanent sites were selected, and under the authority of the ABMC, a commemorative overseas program was carried out that included the construction of several monuments and permanent American overseas cemeteries with chapels.

For those who remained buried overseas, the United States declared that permanent cemeteries would not be established in either Germany or Japan, because these nations had been former enemies, although Italy was deemed a suitable site because it had joined the Allies during the war. Other sites were considered unacceptable because they were geographically inaccessible or because it was felt that parents and widows would be unwilling to allow their next of kin to remain buried on remote islands or places where hazardous forces of nature made them unsuitable candidates as the final resting places for the fallen American service members. Although the United States fought its next two wars in Asia, not Europe, the government was reluctant to place permanent burial grounds in the Third World, particularly in Asia, mirroring the ambivalence many Americans felt toward these regions.

The ABMC Today

Nearly 60 years would pass before a National World War II Memorial would be officially opened to the public in 2004. Logically, it seems that the memorial should have been built before, not after, the memorial to the veterans of the Vietnam War was opened in 1982 (and maintained by the National Park Service) and prior to the congressional legislation passed in 1986 that authorized the ABMC to establish a Korean War Veterans Memorial. However, on May 25, 1993, President Bill Clinton signed Public Law 103-32 authorizing the ABMC to construct a memorial in the United States to honor the veterans of World War II and commemorate American participation in the war.

On June 6, 2007, 3 years after the World War II Memorial was completed in the United States, a new \$30 million Visitors Center was dedicated by the ABMC at the American cemetery in Normandy, France, during the commemoration of the 63rd Anniversary of D-Day. The decision to build the interpretive site here was largely in response to the

veneration for the Second World War that peaked with the release of Steven Spielberg's hit film *Saving Private Ryan* in 1998 and with Tom Brokaw's bestseller *The Greatest Generation*. It remains the ABMC's most visited cemetery, receiving approximately 1 million visitors each year, and is often used as a backdrop for presidential visits and commemorative speeches.

Decades after its inception, the ABMC still maintains the monuments and cemeteries built to commemorate the First and Second World Wars, but the federal agency's commemorative mission has expanded to encompass 24 overseas military cemeteries that serve as resting places for almost 125,000 American war dead; Tablets of the Missing, which memorialize more than 94,000 U.S. servicemen and -women; and 25 memorials, monuments, and markers.

Each year, the ABMC receives thousands of visitors and public inquiries, many seeking assistance to facilitate visits or to locate individual grave sites. The organization provides a variety of services to meet these requests that include travel advice to the sites, photos of headstones and Tablets of the Missing, arrangements for floral decorations placed at graves, Honor Roll certificates, and the best modes of travel to cemeteries and memorials.

AMERICAN LEGION

The American Legion is the largest veterans' organization in the United States, with a 2009 membership of about 2.4 million members organized in 14,000 posts in 51 U.S. departments and 4 outside the United States. This entry describes the history of the American Legion and its advocacy efforts on behalf of veterans and their families.

Founded in 1919 by and for the veterans of World War I, the American Legion has gradually extended its eligibility criteria to cover honorably discharged veterans who served in World War II, Korea, and Vietnam and interventions in Grenada, Lebanon, and Panama, and to active-duty personnel or those honorably discharged since the beginning of the Persian Gulf War in 1990. Since its inception, the legion has emphasized veterans' affairs, a strong defense, and the promotion of patriotism as central areas of interest. Its policies are set by the annual national convention, whose delegates are elected by the rank and file. Convention delegates elect the leadership on an annual basis. Between conventions, a national executive committee functions as the governing body, supported by a permanent staff at the group's national headquarters in Indianapolis and a legislative office in Washington, D.C.

The American Legion has been an important contributor to federal policy regarding veterans' affairs. Following World War I, the group was instrumental in the creation of the Veterans' Bureau (later called the Veterans Administration; in 1989, the Veterans Administration was elevated to U.S. Cabinet-level status, and it became the Department of Veterans Affairs [VA]). The American Legion played a key role in the establishment and codification of benefits as well as in the push for a federal bonus to World War I veterans during the interwar period. Its greatest achievement came with the passage of the legion-drafted Servicemen's Readjustment Act of 1944 (the G.I. Bill of Rights). Besides the act's oft-noted social and economic effects on postwar America, it also provided a template for the extension of benefits to subsequent groups of veterans. In addition, the legion has mounted an ongoing defense of veterans' benefits that the group insists are unbreakable obligations not to be confused with ordinary social legislation.

Legionnaires have been consistent advocates of military preparedness, especially the creation of large citizen-soldier reserves. The development of a

system of universal military training remained the legion's top defense priority from its beginning until the campaign fizzled out in the 1950s. The group's innate opposition to communism and conviction that the outbreak of World War II was the result of U.S. isolationism and unpreparedness made it an ardent backer of the anticommunist foreign policy of the Cold War decades. The crumbling of public support for the American commitment to the Vietnam War during this period became a particular source of frustration and concern within the legion.

Apart from veterans' affairs and national security concerns, the legion has pursued a range of patriotic and community endeavors, from the American Legion Baseball League to high school oratorical contests to disaster relief. Its patriotic commitment to "Americanism" occasionally led to clashes with groups that the Legionnaires considered unpatriotic or harmful to the American society, such as pacifists or those believed to be sympathetic to America's enemies.

Changes in the criteria for eligibility have enabled the legion to transcend generational change. The great influx of World War II veterans more than doubled membership, which reached its historic high point in 1946. Contrary to initial expectations that Vietnam veterans would shun established veterans' organizations, they have come to represent the largest single group within the American Legion and dominate leadership positions. Their participation has offset some of the losses of World War II veterans and kept membership totals relatively stable into the first decade of the 21st century.

In the post-Cold War period, the legion vigorously opposed the reduction in force during the 1990s as detrimental to national security as well as a cause of hardship for those involuntarily separated from service. It has continuously pushed for a full accounting of American prisoners of war and soldiers missing in action of past wars, especially the Vietnam War, and has promoted awareness of this issue whenever possible. In line with its traditional patriotic emphasis, the legion has taken a special interest in the prohibition of flag desecration and campaigned vigorously for a constitutional amendment to that effect throughout the 1990s and into the first decade of the 21st century. Echoes of the frustration with critics of the Vietnam War can be found in the legion's insistence on home front unity as key to success in the wars in Afghanistan and Iraq.

Its primary focus remains veterans' affairs. The group has been adamant about the need to make

VA spending conform to the needs of veterans rather than budgetary considerations. The legion has pursued the enactment of a set of reforms known as the “G.I. Bill of Health” to increase access to VA health care for veterans and their dependents as well as to ensure the future viability of the system. It has also carried on a lengthy campaign for recognition of the effects of exposure to the herbicide Agent Orange on Vietnam veterans and fought to gain recognition of service-connected disabilities among veterans of the Persian Gulf War.

The improvement of access to education in part by closing the gap between G.I. Bill benefits and ever-increasing costs of higher education has been another major concern. A legion-assisted “Desert Storm G.I. Bill” first introduced in 1992 failed to pass, but in 2008, the successful Post-9/11 Veterans Education Assistance Act greatly increased stipend amounts and addressed other inequities in the system. Pension issues, in the form of so-called concurrent receipt legislation, became a priority issue for the legion in the early 2000s. The effort aimed to eliminate the prohibition on simultaneously receiving VA disability benefits and military pensions and thus removing what the American Legion considers an unfair penalty levied on military retirees. At the grassroots level, it initiated new community programs to support returning veterans of wars in Afghanistan and Iraq as well as the families of deployed personnel.

recognition of the independent United States. The conflict originated in a decade-long dispute over the extent of the British Parliament’s authority over the colonies. The political debate eventually escalated to armed hostilities, as the British government used force in an effort to impose obedience on the colonists, while the colonists first fought to retain control over their domestic affairs and later for independence. Despite suffering numerous military defeats, the Americans won several key victories and gained crucial assistance from France in 1778. A year later, Spain entered the war as an ally of France, and the Netherlands joined the fight against Britain in 1780. These interventions transformed a struggle between Great Britain and its colonies into a global war that shattered the British Empire, created a new republic in the former American colonies, and inspired later revolutions in France and Latin America. This entry examines the causes of the revolution, traces the course of the war, assesses the factors that led to American victory, and discusses the implications of the revolution.

Causes of the Revolution

Throughout most of the colonial period, British officials paid little attention to domestic affairs in their North American colonies, a policy called “salutary neglect” that virtually left the colonists to govern themselves. In these circumstances, colonial legislatures assumed increasing local authority. By the mid-18th century, the colonial assemblies considered their authority in domestic affairs equal to that of the British Parliament.

After the French and Indian (Seven Years’) War ended in 1763, however, the need to reduce the British government’s debt led officials in London to assert more control over the colonies. Wartime expenses had doubled Britain’s national debt. Unable to raise taxes further in Britain, where the average subject paid 25 shillings annually, King George III’s ministers sought additional revenue from the colonists, who as the least taxed members of the British Empire paid an average of only 6 pence per year in imperial taxes.

In 1765, Parliament passed the Stamp Act, which taxed newspapers, legal documents, and other paper goods in the colonies. The act marked the first ever effort by Parliament to impose a direct tax on the colonists and sparked a storm of protest. The colonists argued that only their own legislatures could

AMERICAN REVOLUTION

The American Revolution, a war waged between Great Britain and 13 of its North American colonies, began in 1775 and ended in 1783 with the British

impose such internal taxes and that the Stamp Act was therefore unconstitutional.

Opposition to “taxation without representation” was fueled by the colonists’ political ideology, which was heavily influenced by the writings of a marginal group in Britain known as “Radical Whigs” or “Commonwealth Men.” The Radical Whigs believed that the king’s ministers would use a corrupted Parliament to provoke wars, thereby increasing debt to justify increased taxation and the creation of a standing army. Once subjects accepted the loss of their property through taxation, the ministers would make further impositions on the people’s liberty, using the army to crush opposition, until the people were reduced to slavery. The pattern of events leading to the Stamp Act—the French and Indian War, heavy debt, and direct taxation of the colonists to support a military garrison in North America—lent credence to the Radical Whigs’ theory. British arguments that Parliament represented the entire empire, and that therefore the colonists

were “virtually” represented in the British legislature, failed to sway the colonists.

Colonial resistance to the Stamp Act took many forms, including petitions demanding the act’s repeal, a boycott of British goods, and, occasionally, violent protests. In 1766, Parliament repealed the act. Another British attempt to raise revenue in the colonies, the Townshend Acts of 1767, which imposed customs duties on paper, tea, and other items, met with similar opposition. It proved impossible to collect the Townshend duties, and Parliament repealed all of them in 1770, except the tax on tea.

Parliament’s passage of the Tea Act in 1773 sparked yet another crisis in British-colonial relations. The act was not directed specifically at the colonists but, instead, was intended to prevent the financial collapse of the East India Company, an event that British officials feared might create an economic crisis in Britain. The Tea Act reduced the tax on tea to help the company increase its sales. However, the colonists, influenced by Radical Whig

Boston Tea Party.

ideology, believed that the tax reduction was a ploy to deceive them into paying the tax and thus sacrificing the principle of opposing taxation without representation. On the night of December 16, 1773, a crowd in Boston boarded three ships and dumped their cargoes of tea into the harbor.

British officials responded to the “Tea Party” with punitive action. Parliament passed the Coercive Acts, which closed the port of Boston and replaced the civilian governor of Massachusetts with General Thomas Gage, commander in chief of the British Army in North America. By targeting Massachusetts, British leaders expected that the Coercive Acts would intimidate other colonies into submitting to British authority. Instead, the other colonies feared that they would suffer a similar fate, causing 12 colonies (all except Georgia) to send representatives to the First Continental Congress in Philadelphia to formulate a united policy against the British. The Congress convened on September 5, 1774, petitioned the king and Parliament for a repeal of the Coercive Acts, and agreed to boycott imports from Britain.

The Outbreak of War

With tensions high, Gage hoped to forestall armed conflict by seizing the colonists’ stockpiles of munitions. On April 19, 1775, 700 British troops sent to seize a magazine (a storehouse for weapons and ammunition) at Concord clashed repeatedly with Massachusetts militia. As news of the raid spread, several thousand militiamen from across New England gathered and within days besieged Gage’s army in Boston. The Second Continental Congress, having convened in May, assumed control of the troops and on June 15 appointed George Washington commander in chief of the new Continental Army. Washington was made subordinate to the Congress, thus establishing the American tradition of civilian control over the military.

Meanwhile, colonists engaged in another battle against the British forces after the militiamen occupied a position in Charlestown that threatened the British hold on Boston. In the June 17 Battle of Bunker Hill, the British dislodged the colonists in a series of frontal attacks that cost British forces 1,100 casualties.

While Washington organized the troops at Boston, Congress dispatched another army to invade Canada in the hope that the French population

would join the rebellion. On December 31, the British general Guy Carleton repulsed a colonial assault on Quebec.

The War in the North

On March 17, 1776, the British evacuated Boston after Washington occupied Dorchester Heights overlooking the city. The new British commander, General William Howe, sailed to Halifax, Nova Scotia, where reinforcements brought his strength to more than 30,000 troops, many of whom were German soldiers hired by the British government and called “Hessians” by the colonists. Howe then moved to attack New York. The city would provide a naval base and give the British control of the southern end of the strategic Hudson River–Lake Champlain corridor to Canada. Before the fighting resumed, the Continental Congress, having decided that reconciliation with Britain could not be achieved on terms acceptable to the colonists, declared independence on July 4. The delegates also believed that as an independent nation, the United States stood a better chance of gaining foreign assistance in their struggle against Britain.

Washington anticipated Howe’s objective but was forced to divide his army of 25,000 men between Long Island and Manhattan so that Howe could not land at either place unopposed. Howe landed on Long Island and, on August 27, attacked the American forward position at Brooklyn. The Americans were routed, but Howe chose not to attack the second American line. On the night of August 29, Washington evacuated Long Island. After an unsuccessful attempt to open negotiations with the Americans, Howe moved again in September, forcing Washington to abandon Manhattan. Following clashes at Harlem and White Plains, Washington retreated across the Hudson.

With his force reduced to 6,000 men by casualties, desertion, and lack of support from the dispirited militia, Washington retreated across New Jersey and crossed the Delaware River to safety in Pennsylvania. Howe then halted his campaign and dispersed his troops in garrisons around New York City and across New Jersey.

Realizing that the string of military defeats and the loss of New York City and New Jersey had devastated American morale, Washington decided that action had to be taken to restore the desperate situation. He crossed the Delaware during the night

of December 25 and attacked the Hessian garrison at Trenton the next day, killing or capturing more than 1,000 Hessians. Washington then eluded a British force dispatched from New York and struck the British post at Princeton on January 3, 1777. These successes caused Howe to abandon most of New Jersey and revived American morale.

In planning the British campaign for 1777, Howe proposed that his army march from New York to Philadelphia in the spring. This move would force Washington to commit the Continental Army to the defense of the rebel capital, theoretically allowing Howe to eliminate both symbols of American resistance. General John Burgoyne suggested invading New York from Canada via the Hudson-Champlain corridor to seize Albany and isolate New England from the other colonies. British officials approved both plans. Contrary to many accounts, there was never a plan for Howe to advance up the Hudson in support of Burgoyne; however, Burgoyne's campaign was predicated on Howe moving quickly against Philadelphia, thus preventing Washington from reinforcing the American army in New York.

Instead of marching directly to Philadelphia, Howe squandered weeks trying to lure Washington into a decisive battle in New Jersey. Washington avoided combat, and Howe moved to Philadelphia by sea. On September 11, Howe defeated the American army posted behind Brandywine Creek and, after further maneuvering, occupied Philadelphia without opposition.

Howe dispersed his 15,000 troops, leaving about 8,000 at Germantown north of Philadelphia. Washington attacked Germantown on October 4 with his entire force of 11,000. The initial assault broke the British line, but Howe's troops regrouped and forced Washington to withdraw. Nevertheless, Howe's successes did not end American resistance.

Meanwhile, Burgoyne's 7,000 troops captured Fort Ticonderoga and then plodded southward, slowed by their own baggage train and American obstructions. When Burgoyne approached Saratoga, he found his way blocked by 7,000 Americans under General Horatio Gates, who was continually receiving reinforcements. Burgoyne twice tried to move past the American left flank but was defeated on September 19 and again on October 7. British general Sir Henry Clinton advanced northward from New York in a futile effort to aid Burgoyne, who surrendered his army on October 17. Gates's victory

proved one of the most decisive of the war, as it eliminated an entire British army, offset the morale effects of the American failures in Pennsylvania, and, most important, convinced the French government to enter the war on the American side.

French intervention changed the character of the war from a colonial struggle for independence to a global conflict between European powers. Howe, criticized for his dilatory movements, resigned and was succeeded by Clinton. Unable to hold New York and Philadelphia and still comply with orders to dispatch 12,000 troops to Canada and the West Indies, Clinton evacuated Philadelphia. Washington, his army having recovered from the harsh winter at Valley Forge, attacked the British

rear guard at Monmouth, New Jersey, on June 28; the battle ended in a draw.

Most of the fighting in the north then shifted to the frontier. Loyalist and Native raiding parties struck devastating blows against settlements in New York and Pennsylvania in 1778. The Americans countered with a foray into present-day Indiana by Colonel George Rogers Clark in 1778–1779 and a larger expedition against the Iroquois in 1779 under Major General John Sullivan.

The War in the South

Although French intervention restricted the forces the British had available to employ against the Americans, officials in London refused to remain on the defensive in North America. Instead, they shifted their attention on the South, where they believed smaller British forces could take the offensive with support from the numerous Loyalists and Native Americans in the region. British leaders also expected the large numbers of slaves in the South to divert the attention of the American militia, who would be more focused on preventing slave insurrections than on opposing the British army.

Clinton began redirecting the British military effort from the North to the South in November 1778, when he dispatched 3,000 troops from New York to Georgia. On December 29, the British defeated American forces outside Savannah and occupied the city. In September 1779, the American Southern army under General Benjamin Lincoln joined a French fleet and army in an effort to retake Savannah, but a Franco-American assault on October 9 was repulsed with heavy losses.

The successful defense of Savannah convinced Clinton to expand Southern operations by attacking Charleston, South Carolina. The city and its 6,000 defenders surrendered to the British on May 12 in the worst American defeat of the war. British forces then occupied the interior of Georgia and South Carolina.

Congress ordered Horatio Gates to take command of Continental troops in the South. Gates received reinforcements from militias from North Carolina and Virginia and moved against Camden, the key British base in the South Carolina interior. Gates planned to occupy a strong position north of Camden while American partisans severed the supply line to Charleston, thus forcing the British

to evacuate Camden and securing North Carolina from invasion. Lieutenant General Charles, Earl Cornwallis, left in command in the South when Clinton returned to New York, marched to strike Gates. In the August 16 Battle of Camden, Cornwallis decisively defeated the Americans, resulting in Gates's dismissal from command.

Cornwallis then invaded North Carolina, but American militia destroyed a force of Loyalist militia covering his left flank at King's Mountain on October 7. The blow forced Cornwallis to withdraw into South Carolina and virtually ended British efforts to employ Southern Loyalists in support of regular troops.

Gates's successor, General Nathanael Greene, assumed command of the Southern army in December. Greene sent a detachment under General Daniel Morgan into northwestern South Carolina to check Loyalist forces there. As Greene hoped, Cornwallis also divided his army, sending 1,100 men under Lieutenant Colonel Banastre Tarleton to strike Morgan. Tarleton attacked Morgan at the town of Cowpens on January 17, 1781, and was routed. Morgan then withdrew to avoid a confrontation with Cornwallis's main force. Cornwallis set off in pursuit, but Morgan joined Greene and the Americans retreated into Virginia, barely escaping Cornwallis.

After receiving reinforcements, Greene returned to North Carolina. Cornwallis attacked the Americans at Guilford Courthouse on March 15 and drove Greene from the field, but the British suffered heavy losses and withdrew to Wilmington. Greene then made one of the most important decisions of the war. Rather than follow Cornwallis, he marched into South Carolina, where the 5,000 British troops were widely dispersed.

In April, Greene began a 4-month campaign in which his Continental troops, supported by South Carolina partisans under Francis Marion, Thomas Sumter, and Andrew Pickens, wrested control of most of Georgia and South Carolina from the British. Although Greene's Continentals suffered defeats at the Battle of Hobkirk's Hill on April 25 and at the siege of Ninety Six in June, Greene kept the British forces occupied, while the partisans captured isolated British posts, cutting the line of communication between Charleston and the interior. The British fell back to the environs of Charleston and Savannah, and a final effort to hold a line along the

Santee River in South Carolina ended after Greene inflicted heavy casualties on the British army at the Battle of Eutaw Springs on September 8.

Cornwallis, meanwhile, decided that the best way to secure Britain's hold on Georgia and the Carolinas was to march to Virginia and force that state to submit to British rule. In Virginia, Cornwallis united his army with a 5,000-man British expedition operating along Chesapeake Bay. After a series of devastating raids failed to force Virginia's submission, Cornwallis moved his army to Yorktown. Washington saw an opportunity to win a decisive victory by trapping Cornwallis and marched French and American troops to Virginia. A French fleet defeated the Royal Navy in September, closing the sea route to Yorktown, while 18,000 French and American troops surrounded Cornwallis's 8,000 men. Cornwallis surrendered on October 18. His defeat marked the end of major fighting, as Parliament resolved to halt offensive operations against the Americans. On September 3, 1783, British and American representatives signed the Treaty of Paris, ending the war and recognizing the independent United States.

Costs and Controversies

The war involved a major portion of the American population as well as significant manpower from France, Britain, and the German states whose troops the British hired. About 230,000 North American colonists served in the Continental Army, and an even greater number in the militia. Peak French strength in America was approximately 8,000, not including soldiers serving in the West Indies. British troop strength in North America reached its maximum of 56,000 in 1781, although a large percentage of these men were engaged in operations against the French and Spanish rather than the Americans. British forces were augmented by some 30,000 hired German soldiers, by thousands of American Loyalists, and sometimes by fugitive slaves, a few of whom bore arms. The British made several efforts to entice slaves to assist them with promises of freedom, hoping to simultaneously deprive the colonists of a portion of their labor force while freeing British soldiers for combat as African Americans assumed the duties of teamsters, engineers, and laborers. Native Americans also contributed several thousand men to the fight, with most serving with the British.

Casualty figures are unreliable. An estimate of 5,200 British and 7,000 American regulars killed in battle is widely accepted, although these numbers certainly understate actual losses. In the aftermath of battle, officers on both sides often found it difficult to determine whether men listed as missing had been killed, captured, or deserted. Recordkeeping was especially poor in the militia, where men frequently came and went at will. Reports of Native losses are sketchy. Both sides tended to underreport their own losses while exaggerating enemy casualties, so that the actual human cost of the war remains uncertain.

Historians generally agree that the American military leadership was a decisive factor in winning independence. Washington recognized the importance of preserving his army as a symbol of resistance and generally avoided battle except on favorable terms. Although he lost most of the battles he fought, Washington displayed an unerring sense of timing that enabled him to win crucial victories when they were most needed, as at Trenton and Yorktown. Greene's strategy in the South, and in particular his ability to coordinate Continental operations with partisan forces, has only recently been recognized as having contributed greatly to American success.

Historians have only recently begun to address the roles that Native Americans and African Americans played in the conflict. When the Natives were discussed, it was usually in terms of whether or not the colonists and British should have employed Native allies; historians now agree that Natives were independent actors with a stake in the outcome of the conflict. As a result of policies instituted by the British government beginning in 1763 that sought to preserve Natives' land and prevent trade abuses, most Natives chose to support the British.

Early histories of the revolution either omitted slaves' roles or stressed their loyalty to American masters. Recent work has demonstrated that thousands of slaves saw the war as an opportunity to escape bondage. In the North, most slaves believed that freedom could most likely be obtained through military service in the Continental Army. In the South, where most states refused to permit slaves to perform military service, the majority of African Americans sought freedom by supporting the British.

Another debate concerns the strength of Loyalism. Many historians have asserted that Loyalists were few and consisted mainly of royal officials and

the wealthy elite. More recent studies suggest that Loyalists represented a fairly typical cross-section of American society, although consensus on their numbers and contributions to the British remains elusive. Furthermore, many individuals and some groups, such as the Quakers, opted for neutrality. The American rebels labeled such neutrals Loyalists, making it difficult to draw distinctions between neutral colonists and the many passive Loyalists who refused to declare themselves when British forces were not present to protect them.

Another issue still unresolved concerns the composition of the Continental Army. Much scholarship suggests that most Continental soldiers came from impoverished classes. Recent research has challenged this view, at least in New England, where both Continental and militia soldiers appear to have reflected the larger society. In Virginia, however, studies show that a disproportionate number of that state's soldiers came from the lower classes.

America's experience in Vietnam in the 1960s inspired historians to examine other dimensions of the revolution, including the American militia's effectiveness. While many historians had dismissed the militia as ineffective because militiamen often performed poorly in open battle against British regulars, John Shy argued that the militia made crucial contributions to American success by suppressing Loyalist insurgents and defending the frontier from Native American attack, thus freeing the Continental Army to focus on its British adversary. Russell F. Weigley, focusing on the militia's employment as a partisan force, demonstrated its effectiveness in harassing British detachments and supply lines.

Historians continue to debate the extent to which the revolution altered the social structure of the colonies after independence. Some consider the revolution a conflict that simply replaced rule by the British and colonial Loyalist elites with rule by a rising American upper class that required independence to achieve political and social dominance. Others, such as Gordon S. Wood, assert that the revolutionary movement, with its rhetoric of equality and its mobilization of the populace across class, racial, and gender boundaries, transformed a hierarchical, patriarchal society into a more egalitarian society that continued to move toward equality and democracy in succeeding years.

Lessons Learned

When the revolution came to a close, the Americans were left with an abundance of valuable experience. They had overcome some of their fear of a professional army, and they recognized that such a force would be essential in any future conflict. The existence of a regular army was, in fact, more important than the possession of territorial objectives, as Washington's strategy of sacrificing cities rather than risking the loss of his army had demonstrated. A regular army, provided it remained under civilian control, had proven to be a reliable defender of liberty rather than a threat to it. Militia, while adequate protection in time of peace, was no longer considered sufficient to defend the country in wartime. Militia could, however, still be a valuable adjunct to regular troops, when used effectively by commanders such as Greene and Morgan. With the acceptance of the need for a professional army in times of war came the recognition that the system used during the revolution to manage and supply the army was inadequate. Congress had lacked the power to recruit, equip, and feed the Continental troops, frequently placing the success of the revolution in jeopardy. The need to defend the United States effectively was a major factor in convincing Americans to adopt a new system of government, the Constitution, that gave the president and Congress the powers of taxation and authority over the military necessary to provide security if the Americans' hard-won liberty were to be threatened in the future.

AMMUNITION

The term *ammunition* derives from the French term *la munition*, and was initially applied to all war materials. Eventually, the meaning narrowed to designate gunpowder and artillery shells only. At the current time, it connotes all objects utilized by one belligerent to apply destructive force to an opponent. It is often used synonymously with *ordnance*.

The term *ammunition* covers a wide range of materials designed for various uses, from bombs delivered by aircraft to rifle bullets. The various

types can be differentiated both by their delivery systems and by the use for which they were developed. Generally, the various types fall into several categories. These include antipersonnel, armor-piercing, and incendiary ammunitions.

This entry presents a brief overview of the development of main types of modern ammunition and their employment. It focuses on the different types of ammunition utilized by infantry, artillery, and aircraft. The likely trends of continuing evolution that follow in the development of various forms of ordnance, such as “smart” ammunition, will receive attention as well.

Development

The development of various types of ammunition corresponds with the types of conflicts at any given time in history. During the Second World War, for example, when nations committed their entire industrial base to the support of the war effort, munitions were developed that could wield the most destructive force against the enemy's industrial and human resources. As current wars follow a trend toward more low-intensity fighting, with civilian populations often utilized as cover by one belligerent or another, the creation of munitions that can be lethal in their impact yet discretionary in their targeting has received greater emphasis.

Small Arms Ammunition

The standard ammunition of the infantry soldier today, as from the beginning of the use of gunpowder weapons, is the bullet. This is generally conical in shape and varies in caliber and design based on the function it is designed to perform. It was developed in the 19th century and received its first major employment in the American Civil War. The First World War witnessed the first large-scale utilization of the cartridge, which is the system that includes the bullet, propellant, and metal shell casing. A rough survey of modern bullets includes the following varieties: armor piercing, blanks, blended metal, exploding, frangible, incendiary, lead, less lethal or less than lethal, jacketed lead, nontoxic, practice, solid, and tracer. Each of these was developed to perform a specific task in combat or in training. In recent years, greater use has been made of two new types of ammunition: nonlethal projectiles and what are often referred to as smart bullets. Nonlethal

projectiles include ammunition such as rubber bullets and, more recently, pepper bullets. Both of these forms of projectile are designed to stop targets but not with lethal force. The latter not only causes pain on impact but contains a heavy dose of pepper irritant as well. The term *smart bullet* encompasses a range of projectiles designed to alter their course in flight in order to intercept a target, or to explode at a certain designated point. For example, U.S. forces recently utilized a form of smart bullet in Afghanistan, a projectile designed to detonate at a precise distance from a designated target. While this attribute has existed for some time in artillery, it is a radical new development in small arms.

Artillery/Tank Ammunition

Artillery can trace its ancestry in the West back to the Middle Ages, when the first large cannons were developed for siege warfare in Europe. Insofar as modern artillery ammunition is concerned, there are three basic types: antipersonnel, armor piercing, and highly explosive. Incendiary rounds are often grouped with the third type. These are differentiated by the type of damage they are designed to inflict on an opponent. Likewise, artillery projectiles are differentiated by the manner in which they are assembled. There are four types: (1) fixed shells, in which the projectile comes as a complete round; (2) semifixed, in which the cartridge and propellant are separate but in the same container; (3) separate, which are used in larger guns in which there is a sealed cartridge and a separate propellant; and finally (4) separate loading, in which the projectile, propellant, and fuse all come separately. A recent development in the realm of artillery munitions is the introduction of the depleted uranium round. These are essentially armor-piercing shells manufactured with depleted uranium, which is a very heavy element and thus very useful for penetrating armor. These were utilized by the U.S. forces extensively in the 2003 Iraq War against Iraqi armor. Some groups have raised concerns over the use of this form of ammunition due to concerns about the long-term health effects it may have on both the users and recipients.

Aircraft Ammunition

The first use of aircraft in warfare took place in World War I. World War II witnessed a drastic

expansion of aerial bombardment. The great weakness of this form of attack was seen as lack of accuracy concerning the delivery of ammunition to a specific target. This led to the development of the first guided munitions during the Second World War. The most recent developments in guided munitions fall in the general category of smart bombs, weapons that are guided to their target using lasers, optical navigation system, global positioning satellite, or inertial navigation system. Likewise, some of these projectiles are designed to be able to alter their trajectory in flight to better accomplish the task of hitting their intended target. Traditional or dumb bombs simply fall from their plane, without the ability to control their descent to guarantee a direct hit on the intended target. Beginning in the 1960s, an additional type of bomb began to develop known as the dual-purpose improved conventional munitions or cluster bomb. Aircraft, likewise, can deliver nuclear weapons.

Conclusion

Smart bombs and nonlethal projectiles, like other guided ammunition, form part of a trend in current ordnance development directly linked to the types of conflict prevalent in the world at the present time. Much of the fighting occurring in present conflicts occurs in the midst of civilian populations. To minimize the injuries inflicted on civilian populations, a greater need for precise ammunition has arisen.

AMPHIBIOUS VEHICLES

Amphibious operations have occurred for millennia when attacking forces landed on shores of oceans, lakes, or rivers held by enemy forces. Speed and overwhelming force were essential to tactical success, because the assault forces needed to get sufficient numbers of troops and equipment ashore before the defenders could drive them back into the sea. Transporting the assault forces to shore required specialized boats, but these vessels were limited in the places where they could land troops. Shores had to be accessible to the shallow draft boats and free of obstructions like reefs or sandbars above and below the waterline. Only true amphibious vehicles could traverse such obstacles. It was not until the 20th century that amphibians were developed and utilized in these operations. This entry discusses the evolution of amphibious vehicles and their equipment and specifications.

Premodern

From antiquity until the modern eras, sail- or oar-driven boats only moved assault troops a few miles per hour. Julius Caesar and his Roman legions conducted an assault from the sea when they invaded Britain in 55 BCE, and William the Conqueror and the Normans made an amphibious landing on England in 1066. Typically, assault troops landed directly on the beaches by running their boats aground, or they waded ashore after disembarking close to the shore. Once on the beach, the assault forces needed to be resupplied by sea at least until they gained control of food sources in subsequent operations. This required those sail- or oar-driven boats to be able to be extricated from the shoreline, which was not always possible given terrain, weather, currents, tides, and other factors.

The Second World War

With the advent of steam-driven and later combustion engines in the 19th and 20th centuries, motor-driven amphibious assault boats could run more effectively and thus decrease the restrictions caused by wind, currents, tides, or weather and reduce the time of the ship-to-shore stage of an assault. Making this transit as rapidly as possible grew more critical because of the advances in weaponry that made

artillery more accurate and deadly at longer ranges. This gave the defending forces a decided tactical advantage.

The photographs and films of the U.S. military's LCVP (landing craft, vehicle, personnel) landing on the Normandy beaches on D-Day in 1944 are an iconic image of amphibious operations. But even the LCVP was not a truly amphibious vehicle because it was a boat. Its ability to transport troops ended at the shoreline. A vehicle with amphibious capabilities needed mobility on water and on land. In fact, a more descriptive term should be *amphibian* vehicles.

The first significant amphibian assault vehicle appeared in the late 1930s in the LVT (landing vehicle, tracked). It was not originally designed with military applications in mind. On the contrary, the so-called Alligator boat was designed to be a rescue vessel used to save downed aviators or hurricane victims in the Florida Everglades. The Alligator possessed no propeller. Instead, it had dozens of metal paddle-wheel tracks like a tank's tracks. The treads provided propulsion in the water and gave the vehicle the ability to climb onto land, over sandbars, and across coral reefs. The first version, the LVT-1, was 20 feet long and 8 feet wide and weighed 8,000 pounds. Carrying 20 troops or 4,500 pounds of equipment, it could make 5 miles per hour at sea and 25 miles per hour on land. Later versions of LVTs achieved better speeds, but they offered minimal armor protection to their passengers and crew. One version—the LVT (A)—was mounted with a turreted 37-mm cannon to provide fire support for immediate amphibious assault forces on shore until heavier tanks could be debarked. LVTs could be seen by the hundreds during every American amphibious assault during World War II.

Similar in capability to the LVT was the DUKW. In this acronym, the *D* indicated that it was designed in 1942, the *U* stood for utility (amphibious), the *K* indicated that it had an all-wheel drive, and the *W* meant that it had twin rear axles. Literally an amphibian truck, the DUKW was a boat hull mounted on a standard General Motors Corporation 6 × 6 truck frame and fitted with a propeller. The wheels enabled the vehicle to move on land and the propeller on water. The DUKW proved its value in being able to carry 5,200 pounds of equipment, weapons, or troops well inland after its ship-to-shore transit. It weighed 20,000 pounds fully loaded

and could make 11 miles per hour on water and 50 miles per hour on land. DUKWs were 32 feet long and 8 feet wide. They offered good mobility, especially on land, but they were not very seaworthy in rough weather and offered little armor protection to passengers and crew. Some 21,000 DUKWs were built during World War II.

The Cold War

The LVT concept remained for many decades in the U.S. military. By 1972, the newest iteration—the LVT-7 or officially the AAV (amphibious assault vehicle)—came on line. U.S. Marines call them “amtracks.” The AAV was a significantly upgraded version of its predecessors of the 1940s and 1950s. Among the upgrades was propulsion in the water provided by twin waterjets. These jet systems have become the most common means of propulsion since the 1970s. Despite weighing 29 tons, the AAV offered good speeds of 9 miles per hour during the ship-to-shore transit and an impressive 45 miles per hour on land. Its thicker armor gave more protection to its three-man crew and 25 full-equipped men. The AAV also possessed greater armament, a .50-caliber machine gun and either an Mk 19 automatic grenade launcher or an M242 Bushmaster. Other nations have developed amphibian vehicles, including the Soviet Union’s PTS (Plavayushchij Transporter–Sryednyj), which is a tracked amphibious transport vehicle driven by propellers in the water, and China’s various amphibious assault tanks driven by jet propulsion systems.

Perhaps the most creative innovation in amphibian assault vehicle designs can be seen in the LCAC (landing craft, air cushion). Its antecedent dated back to a design in Finland in the early 1930s. The LCAC finally adopted by the U.S. Navy in 1987 was a departure from the wheels, tracks, propellers, or jet systems seen in other amphibians. Instead of these means of propulsion, the LCAC rides on a cushion of air forced downward against water or ground below it. Large skirts around the edges of the vehicle hang down vertically and keep the downward air flow from dissipating or escaping laterally. In the case of the LCAC, this provides a remarkably stable ride for a vehicle capable of traversing obstacles on land or water up to 6 feet high. The LCAC has a length of 87 feet and a beam of 47 feet. Its armament includes a combination of cannon,

machine guns, and grenade launchers. Two engines provide lift, and two more provide propulsion. When fully loaded, the LCAC is capable of running at 45 miles per hour and has a range of at least 200 miles. It boasts an impressive payload of 60 tons or the equivalent of one main battle tank. The LCAC’s long range and high speed give it the ability to fulfill an over-the-horizon strategy during an amphibious assault. In other words, the vehicle can be loaded 25 or more miles from the assault area and then make the ship-to-shore transit in decisively quick fashion. The LCAC can be employed in both military and humanitarian operations. The United States is not alone in developing air cushion amphibious capabilities. Chinese forces use the Jingsah II class LCAC, which is similar to the U.S. Navy’s LCAC. The Russian, Ukrainian, and Hellenic navies use the massive Zubr class LCAC, a vehicle capable of carrying 130 tons of equipment at speeds in excess of 40 miles per hour.

Post–Cold War

Since the end of the Cold War, nations with maritime strategic interests have continued to develop new amphibious vehicles capable of faster, more survivable ship-to-shore movement of troops and better capabilities ground operations. In the United States, however, budget cuts and a willingness to utilize existing technology in new ways has resulted in the cancellation of the most significant new development in amphibious vehicles. The EFV (expeditionary fighting vehicle) represented the next generation in amphibians for the U.S. Marine Corps. Initially scheduled to enter service in 2015 to replace the aging AAV in the American inventory, the EFV was to be able to achieve three times the AAV’s speed on water at 29 miles per hour. On land, the EFV was to be capable of running 45 miles per hour, with an operational range of 75 and 325 miles on water and land, respectively. Armed with the potent 30-mm MK 44 cannon and a 7.62-mm machine gun and equipped with ceramic and composite armor to protect its crew of 3 and 17 fully equipped U.S. Marines, the EFV represented the next logical evolution of U.S. amphibious capability. In January 2011, Secretary of Defense Robert Gates cancelled the EFV project, citing budget shortfalls and the ability to project power from the sea utilizing existing air and sea assets in most plausible scenarios. With this development, the deployment of

LCAC (landing craft, air cushion) in the U.S. Navy.

new amphibious vehicles appears, at least in the near future, to be in doubt.

ANTHRAX

Known to be lethal since ancient times, anthrax is an airborne and cutaneous infectious disease, caused by the spores of the *Bacillus anthracis*. This entry examines the development and epidemiology of the disease and discusses anthrax as a biological weapon.

Background on the Disease

The microbe has a long relationship with laboratory science. Discovered by the German microbiologist Robert Koch in 1876, anthrax was the first pathogen

observed by microbiologists and the first to be cultured. Transmitted through ingestion or open wound contact with the bacilli's spores, anthrax spreads rapidly throughout the body, exploiting the host body's lymphatic system. Mortality is caused by the microbe's production of two exotoxins—edema toxin and lethal toxin—which cause general fluid retention in the lungs and shock in hosts. Death results within days or weeks at the most. The disease has a 90% mortality rate. Anthrax spores are remarkably resilient; capable of surviving extreme temperatures, they may lie dormant in the soil for years until activated on being consumed by grazing animals. Natural occurrences of anthrax in the industrialized world are quite rare, as infected animals are generally isolated and destroyed. More frequent (yet still rare) are cases caused by contact with infected animal products imported from areas (e.g., Africa, Central Asia) where the disease is more common and control mechanisms are lacking.

Treatment of anthrax rests on massive doses of intravenous and oral antibiotics, though the antibiotics are useless after exotoxins appear. Antitoxins are currently in development but as of now are not available to the general public.

Anthrax as a Biological Weapon

History

The first efforts to employ anthrax as a weapon were made by the Germans during the First World War. Several covert programs were initiated to infect Allied livestock supplies in Romania, Mesopotamia, and Argentina. The prospect of biological warfare was sufficient to cause it to be included with chemical weapons in the 1925 Geneva Protocol banning gas and germ warfare. Nevertheless, weaponized anthrax was tested by the British army over the summer of 1942–1943 at Gruinard Island, Scotland. Results indicated that both aerial bombs and artillery shells would suffice to spread the disease throughout swaths of pastureland or small cities, though postconflict decontamination would be virtually impossible, thus rendering the sites uninhabitable for decades. In China during 1941 and 1944, the Imperial Japanese Army's Unit 731 also tested anthrax delivery systems, including the *Uji* bomb, a small aerial bomb using a porcelain case to hold its payload.

The combination of lethality and the durability of the microbial spores made anthrax a favored choice of biological weapons programs in the United States,

the Soviet Union, and other countries in the Cold War. Centered at Fort Detrick, Maryland, the U.S. Army's Biological Warfare Laboratory oversaw the testing and production of various agents and delivery systems, including anthrax. Various tests using live animals and human volunteers were conducted through the 1950s and 1960s, verifying the efficacy of anthrax as a multivector infectious agent, deliverable through aerosol or aerial bomb, contaminated food, and direct skin-to-skin contact. In 1969, President Richard M. Nixon declared a halt to all biological weapons programs in the United States and ordered Fort Detrick to complete its transition to peaceful biological research under the direction of the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID).

The Soviet Union's interest in anthrax is also relatively well documented, including a September 1979 accident at a Sverdlovsk production facility, which resulted in the death of more than 100 persons. Such incidents did not deter Soviet development, however. According to Ken Alibek, the former first deputy chief of the Biopreparat, the Soviet Union's biological weapons program, hundreds of tons of weaponized anthrax strains were stored at Vozrozhdeniya Island in Kazakhstan by the Soviets' security agency, the KGB, and the army until the Soviet Union's collapse in 1991. Abandoned in 1992, the stockpiles of anthrax and other weaponized disease agents were destroyed in a joint U.S.-Kazakhstan program in 2002.

American interest in anthrax continued after the 1969 Biological Weapons Ban. Following the destruction of all weaponized stocks, new strains were investigated and modified in small stocks for vaccine research purposes by USAMRIID in the 1980s. The most successful effort, the so-called Ames Strain, was developed in 1981. Noted for its uniformity and virulence, the Ames Strain was used in the September 2001 bioterror mailing incidents that claimed five persons and infected 17 others. Bruce Ivins, a biowarfare expert employed by USAMRIID, was suspected but not charged; he committed suicide in 2008 on learning that federal prosecutors were about to indict him for the crime.

The Post-Cold War Era

More recently, anthrax and other biological weapons agents were considered an immediate threat in the case of Saddam Hussein's Iraq. In the 1980s, Iraqi researchers developed weaponized

anthrax for use against external and internal threats. The prospect of facing biological weapons prompted the United States and its allies to inoculate its soldiers for anthrax before launching the 1991 liberation of Kuwait and invasion of Iraq in Operation Desert Storm. Following its defeat, the Iraqi regime dismantled its biological warfare program, destroying all existing stockpiles of biological agents.

The specter of future terror attacks was used to expand American research efforts in defensive biological weapons programs, with authorized public spending growing from \$1.6 billion in 2001 to more than \$36 billion in 2006. National Institutes of Health funding for biodefense outstripped spending on influenza research and prevention by a margin of more than 14:1—\$1.76 billion versus \$120 million. While ostensibly intended as a safeguard against future attacks on the homeland, even defensive biological warfare research violates the letter and spirit of the 1972 Biological Weapons Convention, which forbids the creation, production, and stockpiling of new and existing pathogens.

Prior to the start of Operation Desert Storm, an experimental anthrax vaccine was administered to U.S. and British forces serving in Kuwait and Saudi Arabia. In December 1997, mandatory anthrax vaccination was implemented by the order of Secretary of Defense William Cohen in response to publicized claims of weaponized anthrax being maintained by Iraqi forces. Within a short time, soldiers receiving the vaccine reported a series of symptoms including localized swelling, fever, malaise, and long bouts of lethargy.

The controversy over the vaccine continued to build as links were offered between the vaccine and “Gulf War Syndrome,” a neurological disorder associated with the destruction of chemical weapons stocks following Operation Desert Storm. Such reports prompted a series of investigations by the Department of Defense, USAMEDD (U.S. Army Medical Department), and the General Accounting Office. These surveys concluded that the existing vaccine was not sound, as the protective antigen factor in each shot varied, due to production problems. Ongoing reports of acute lingering side effects prompted a series of congressional investigations into the safety of existing vaccine stocks. Since 2003, court injunctions halting mandatory vaccination have stalled the Department of Defense’s mandatory vaccination program, despite Food and Drug Administration statements clearing the vaccine for use.

Terrorism

The problem of biological weapons employed by independent nonstate actors—terrorist groups or demented individuals—is quite real. The 2001 anthrax incident reveals that the greater threat is a terrorist cell’s release of a weaponized biological agent. Unlike nuclear and advanced chemical weapons, formulas for producing large quantities of biological agents are readily obtainable online. A diverse potential market exists, with threats ranging from al Qaeda to domestic antigovernment groups suspected of seeking the means of delivering a biological strike against the U.S. government.

Prevention and detection are both acknowledged as essential defenses against a biological agent release. Efficiency highly depends on training and technology, both of which remain insufficient. Effective detection remains out of reach, with current state devices considered too large and expensive for use outside the laboratory. Training is likewise confused; state and local communities demand protection while also rejecting intrusion into their jurisdiction. Meanwhile, the federal response effort is locked up in interagency rivalries, with various “acronymal” agencies—DOD, HSA, FBI, CDC—competing for funding and recognition.

Any serious biological terror or warfare attack in the United States would likely result in massive panic and high mortality. In the case of anthrax, mass civilian vaccination would be impossible, given the scant supply of existing stocks and the time required to produce new supplies. According to the Centers for Disease Control and Prevention, quick response to a bioterror anthrax release is the key. In a perfect response, with a vaccination program implemented on the first day of an outbreak, the projected mortality for a population of 100,000 is still 5,000 persons. This figure increases incrementally with each passing day, reaching 35/100 if vaccination is deferred for 6 days. Given the general ignorance of anthrax and its symptoms, the later response is considered the norm.

Conclusion

Anthrax remains a threat as much in the abstract as in the real. Prevention, protection, and defense planning against a deliberate release compel the United States and other nations to expend billions of dollars against the much feared outbreak that, hopefully,

may never come. Yet as the extent of threat from asymmetrical actors grows in the 21st century, so too does the prospect of individuals or organizations acquiring weapons of mass destruction capable of wreaking a horrible return on their investment. In the end analysis, societies have little choice but to prepare and plan for the worst-case scenario, even as the woeful realities of practical funding place the best plans out of reach.

ANTHROPOLOGY AND WAR

Anthropologists have long been fascinated with the subjects of war and aggression. Over the years, there have been numerous theories regarding the origin of human aggression and warfare. Some anthropologists have posited an innate drive or even gene for human aggression, seeing, perhaps, a killer ape as a human ancestor. Others have looked at socialization and enculturation processes as the source of individual aggression and warfare. Out of these basic ideas have sprung many refinements, leading to particular theories of aggression and warfare. This entry discusses anthropological theories of war and violence and examines the involvement of anthropologists during wartime.

Anthropologists have looked at warfare as a political relationship between groups in which groups use or threaten to use force against each other. Violence, real or threatened, is the key element of anthropological studies of warfare. War, then, is not individual violence but violence between groups of people. Therefore, most anthropologists disdain biological or psychological explanations of warfare. There are notable exceptions. The type of questions that anthropologists ask cannot be answered by reduction to a killer instinct passed on by a killer ape ancestor. Rather, anthropologists are interested in the variations easily discerned in the frequency and intensity of warfare. There are societies in which warfare is rare or even nonexistent. There are others in which it is all too frequent.

There are three dominant ideas about war in anthropology: (1) a materialist theory, dealing with competition for scarce resources; (2) the social structuralist explanation, in which various structural arrangements either increase or lessen the frequency of warfare; and finally (3) a phenomenological perspective on warfare, which focuses on cultural values and beliefs as a means for understanding the frequency of warfare. Each of these perspectives has had a long history in anthropology and has offered a good deal to the understanding of war and its effects.

Sociobiology is but the latest phase of seeking cultural explanations, including warfare, in biological causes or a universal human nature. Edward O. Wilson, the founder of sociobiology, claims it to be the logical application of Darwinian evolutionary ideas to cultural behavior. All human activity is reduced to the issue of survival of one's genes. Every social organization and cultural system is directed toward that one purpose. In popular terms, the concept is expressed as "the selfish gene." Wilson borrows from earlier scholars, particularly Thomas Hobbes and Herbert Winfield Spencer, agreeing that there is a natural tendency toward violence. Moreover, he agrees with Robert Ardrey, Robin Fox, and Lionel Tiger in holding the descent of modern humans from killer apes. In this view, war is not only natural, that is, innate, but also functional in ensuring the survival of the fittest. In Wilson's view, it is not the individual that is the fittest but certain genes that help preserve the best traits.

For Wilson, even altruism can be subsumed under the rubric of evolutionary fitness. He writes, "Compassion is selective and often ultimately self-serving" (quoted in Jensen, 2011). Sociobiologists often forget or overlook the qualifying terms in Wilson's formulation. They focus on his general idea of there being a genetic basis for human group aggression and the selfishness of most if not all humans. Marvin Harris, among many other cultural anthropologists, attacked Wilson for asking the wrong questions in his research. These anthropologists point out that Wilson ignores the question of why human culture is so much more complex than that of any other animal. Moreover, Harris indicated that seeking a genetic basis for war is as foolish as finding one for brushing teeth. War, like tooth brushing, is a learned response and not a genetically programmed one. Echoing the majority of anthropologists, Harris noted that sociocultural explanations are more valid than sociobiological ones. They are so because they can account for all types of change, not simply glacially slow evolutionary ones, at best.

Sociobiology comes from a long line of similar theories based on Darwinian ideas, although not necessarily put forward by Darwin himself. A few of these theories illustrate the point. Raymond Dart, for example, put forward his theory of human inheritance of a violent human nature. He did so in his 1953 article "The Predatory Transition from Ape

to Man." In 1970, Robert Ardrey popularized the idea in *African Genesis*. This is the famous "killer ape theory," which, simply put, states that humans are different from other apes and are distinguished by their aggression, a trait inherited from their direct primate ancestors. Although it convinces many people in the general intellectual world, it has very little solid evidence to convince anthropologists. Moreover, it does not explain why one sociocultural group would be more violent than another.

A variation on the killer ape theory is one that Michael Harner puts forward. Harner advances the idea that humans are violent because of the nature of the human psyche. He advances an idea of the collective human memory in which insults, losses, injuries, and other psychic pain are stored and to relieve this pain, groups seek revenge. The theory explains violence in specific cases in the Amazon, long a focus of anthropological studies of violence. However, Harner's theory explains only some violence among the group he studies, the Jivaro. It does not explain external violence, such as warfare or raids. Thus, it explains personal feuds but cannot explain broader cases of group violence.

Definition and Origin of War

Keith Otterbein has become a major figure in the field of the anthropology of war. One of his major works, "A History of Research on Warfare in Anthropology" (1999), reviews the immense amount of material on warfare. Otterbein goes beyond a simple review to the use and abuse of anthropological material by anthropologists and other social scientists. Otterbein has long held to a typology that distinguishes among types of violence, including personal feuds, raids, and warfare.

The definitional problem has been a long-standing one within anthropology. Paul Roscoe has listed a number of sources in anthropology that have struggled with this definitional problem. What is clear in this confusion is the fact that for anthropologists there is a cultural basis for warfare and that most "simpler" societies may have violence but do not have organized violence on a level we can term warfare.

Otterbein has reviewed the numerous theories on warfare that anthropologists have put forward. He holds that by 1973, there were at least 16 of these theories, mainly the result of the Vietnam War.

Interestingly, he maintains that no new theories of warfare have emerged since that period and only half or so of these theories still have serious backing. Otterbein notes that all remaining theories are based on research focusing on nonindustrial socio-cultural groups and three premises. He lists these as ultimate causes of warfare, proximate causes, and consequences of warfare.

By ultimate cause, Otterbein means that which sways people to fight. These include the struggle for desired and scarce resources, warfare over women, or internal division between organizations of related men. By proximate causes of war, Otterbein refers to things such as militarism and leaders who have goals that will lead to warfare with others. Consequences of war refers to the results of war, which improve a group's ability to prevail against its enemies.

Otterbein acknowledges that some anthropologists, particularly Napoleon Chagnon, maintain that human beings have an inherent propensity toward violence.

One interesting thing about anthropological theory is that no theory ever entirely dies. While few people still discuss the killer ape theory today, except in popular science fiction movies, there are those who do see a struggle for survival leading to modern humans and who still campaign politically on that theory, arguing that it is the basis of civilization. Theories that blossomed during the Vietnam War are still very much alive today, as recent wars demonstrate clearly. In common with most anthropological theories, these theories are still with us in some form or other.

Sociobiological Theory

At this point, we are back to sociobiology as some anthropologists apply it. Napoleon Chagnon may be its best known proponent among cultural anthropologists. As Chagnon states his case, the high levels of violence in the Amazon are due to fighting over women but not because women are scarce. Rather, warfare over women ensures that the strongest males survive to donate their genes to the next generation. The stronger the male fighter, the more women, and therefore children, he has. He maintains that this idea is evolutionary and that sociobiology explains it. There have been battles within anthropology over Chagnon's theory. The least confrontational holds that Chagnon's theory does not even begin to explain

warfare in general and may be badly off base even regarding raids among the Yanomamo. The most confrontational objections have to do with charges of secret research trying to discover for the military ways to breed super warriors.

The Yanomamo (Also Known as Yanomami)

The Yanomamo, also known as the Yanomami or Yanomama, are a tribe of about 20,000 people distributed between Venezuela and Brazil in around 250 villages in the Amazon rainforest. The entire population of a village lives in a large compound named a *shabono*. The Yanomamo have become famous in anthropological literature because some anthropologists have stated they have an innate violent nature. Napoleon Chagnon has been foremost among these anthropologists. Leslie Sponsel, among others, has opposed these views.

Brian Ferguson has joined the battle over the meaning of the Yanomamo for broader anthropological theory. Ferguson notes that there have been three major perspectives on warfare in anthropology. These are materialist, cultural, and biological. Ferguson examines each of these three perspectives as it applies to the Yanomamo. Ferguson rejects the cultural and biological theories and puts forward a materialist explanation of Yanomamo warfare. He particularly rejects Napoleon Chagnon's view of inherent fierceness among the Yanomamo, noting that the Yanomamo did not suddenly appear on the world scene in the 1950s but had a long history with Europeans dating back to Spanish invaders.

Blood revenge is one of the most commonly cited causes of violence and warfare in tribal societies, yet it is largely ignored in recent anthropological theories of primitive warfare. A theory of tribal violence is presented showing how homicide, revenge, kinship obligations, and warfare are linked and why reproductive variables must be included in explanations of tribal violence and warfare. Studies of the Yanomamo Indians of Amazonas during the past 23 years show that 44% of males estimated to be 25 years or older have participated in the killing of someone, that approximately 30% of adult male deaths are due to violence, and that nearly 70% of all adults over an estimated 40 years of age have lost a close genetic relative due to violence. Demographic data indicate that men who have killed have more wives and offspring than men who have not killed.

Adaptive Behavior Theory

Marvin Harris was a major opponent of Napoleon Chagnon and sociobiology. He put forward a theory that war is primarily an adaptive strategy. One does not have to put forward a mythical killer ape of biological imperative to conquer. Warfare in the Amazon is simply a rational response to the difficult demographic and ecological conditions of the area. Harris emphasized the dangers that low blood sugar levels had on fostering violence in the Amazon. Harris's idea came to be termed the *scarce protein theory*.

Harris, one of the proponents of cultural materialism, argued that humans need to draw energy from their environment. If a sociocultural group cannot draw sufficient energy from its environment to meet the needs of its people, it will turn to violence to attain sufficient energy to meet its needs. Stresses from the environment lead to violence to return a group to equilibrium. Women are a scarce resource, one needed for reproduction. Violence over women is not related to a genetic imperative to reproduce the strongest warrior. Rather, it is the result of the general need to meet scarce resources, including women. To make matters worse, to conserve resources, many groups practice female infanticide, helping to keep women a scarce resource. Later in his career, Chagnon confided to Frank Salamone that he had come to accept Marvin Harris's ideas of the scarce-protein idea of Amazonian warfare.

There are a number of anthropological theories of violence and warfare that emphasize cultural transmission and learning. Rather than looking to genetic or other overly deterministic theories, learning theories or those leaning heavily on acculturationist views look to internal cultural processes and even to human rational and conscious agency to explain warfare.

Theories of Learned Violence

Internal Theory

The internal theory states that ideas of violence are transmitted from elders to younger men. The first theory is of violence learned within the community. Elders do so to enforce customs and traditions. Thus, young boys are taught to be rough with other males, relatives and friends alike. Elders provide

instruction in the use of weapons and teach the skills of warfare. Therefore, the processes of socialization and enculturation can account for warfare among groups as a boundary mechanism, separating "us from them."

External Theories

Brian Ferguson has long argued against any theory that singles out Amazonian Indians as inherently violent or even violent because of internal factors. He clearly places the blame for high levels of violence on the nature of European contact with indigenous Amazonian people. European actions have been to encourage warfare among the Amazonian peoples. European contact has also increased diseases among indigenous peoples and led to warfare. Moreover, the introduction of European goods led to fighting over trade connections. Ferguson does not present a romantic notion of the Amazonian Indian, a "noble savage" view. He knows that there was indigenous violence there. What he does argue is that European contact led to vastly increased levels of violence.

Fraternal Interest Group Theory

Fraternal interest group theory has the merit of being compatible with any of the other anthropological theories mentioned above. This theory is put forward by Theoden van Valzen, W. van Wetering, and both Keith and Charlotte Otterbein. The theory turns to social structural explanations, stating that in societies with high internal dissension, there are male residential kinship groups to protect the interest of the group. We find such groups where patrilocal residence (residing with or near the husband's family) is rife, whereas in matrilocal groups (residing with or near the wife's family), males are not able to give such support to one another. Add the factor of decentralization to the mix, and then the existence of male residence kinship groups and violence is common.

The Zulu Example

A frequent example anthropologists use in discussing warfare is that of the Zulu. Many anthropologists believe that true warfare is a prerogative of the state. The Zulu demonstrate a case of state formation. The Zulu Kingdom became a state in the 19th century. Its formation illustrates both circumscription theory and institutionalized leadership

theory. Robert Carneiro's circumscription theory sees warfare as the key element in state formation. For Carneiro, warfare occurs in areas where agricultural land is limited. Scarcity of land leads to the acquisition of weaker villages by the stronger, better organized ones.

Anthropological Involvement in Vietnam

The Vietnam War was a serious trial not only for the country in general but also for the anthropological profession. At times, it almost tore the profession apart and did set people against one another as well as tearing departments apart. Gerald Hickey presents a firsthand account of one anthropologist's involvement in the war, from his original field work in 1956 to his leaving 18 years later after working for the RAND Corporation on a government contract to study the highland tribes. Hickey hoped to help the tribes, but his account is a cautionary tale of what happens to groups whom the military seeks to make allies in the midst of a war. Hickey provides an account of the disintegration of the Montagnards (indigenous people from the mountains of Vietnam) and the loss of their culture over a long period of time.

Anthropological Involvement in the Military

There has long been controversy concerning anthropological involvement with the American government's war efforts. Opposition goes back at least to Franz Boas's public opposition to anthropological involvement in World War I. After the end of the war, Boas wrote a blistering attack on several archaeologists who spied for the American government in Mexico while posing as scientists. World War II provided an exception to the general anthropological opposition of working with the government for war aims. Some helped develop the forerunner of the Central Intelligence Agency, the Office of Strategic Services. Others worked for the Office of War Information. However, there have been criticisms of some anthropologists who worked in Japanese internment camps on the west coast of the United States, with allowances made for those who worked to alleviate conditions and obtain compensation for those interned.

There have been many attempts to discover anthropological intrigue in the Cold War period. Certainly, Project Camelot was one such effort. Generally speaking, however, most anthropologists

appear to have spoken out against Cold War actions and opposed the Vietnam War. On the other hand, there were many anthropologists who unfairly lost their teaching positions at the instigation of government agents and the hysteria fanned by McCarthyism as David Price has so aptly demonstrated. There was some complicity between anthropologists and the military during the Vietnam War, and there is evidence of the American Anthropological Association's recruitment of anthropologists for various governmental military projects during the Cold War. Meetings of the American Anthropological Association in the 1960s led to strong antiwar resolutions and ethical statements. It is debatable whether the current association is as strongly against the militaristic adventures of the United States as it once was.

It is a simplification to state that American anthropologists have become more radical without adding a number of qualifications. Certainly, there has been more use of postwar ideas like modern feminism, the works of Michel Foucault and Edward Said, the various posts—postmodernism, postcolonialism, poststructuralism—and various types of Marxism. However, there are still strong strains of more moderate positions, ranging from conservatism through more traditional liberalism. Many members have not been happy with what they consider the watering down of the 1960s ethic statements and the use of anthropologists in war zones to combat counterinsurgency. Similarly, there is a general ban on the sharing of secret information with any government, including one's own.

The recent wars in Afghanistan and Iraq have elicited almost unanimous opposition to the use of anthropologists, since 2007, as embedded cultural advisers to combat army and marine troops. The American Anthropological Association has strongly condemned the practice since its beginning. Most of the so-called anthropologists in the project are either students or nonanthropologists. Moreover, the practice is a violation of anthropological ethics that prohibits anthropologists from endangering the people among whom they work in any way. The prohibition goes back at least to Franz Boas's condemnation of the anthropologists who became spies in World War I. Cultural knowledge is dangerous, to understate the case, when used in military situations. Moreover, a number of anthropologists have been killed over the years, especially during the Cold

War, after wrongly being accused as spies. The overwhelming feeling among anthropologists is to keep a distance from any work that may be classified as secret or used by the military to harm people.

ANTISUBMARINE WARFARE

Antisubmarine warfare (ASW) is the area of naval operations that, narrowly defined, has as its mission the denial to an enemy of the effective use of the enemy's submarine force at sea either by their destruction or their neutralization. More broadly, antisubmarine warfare may include action to destroy, disable, or disrupt the associated command, control, and support infrastructure in addition to carrying out direct attacks on enemy submarines. This entry discusses the emergence of the submarine threat and then examines the weapons and systems deployed to defeat the submarine's attack.

Defeating a modern submarine threat requires the coordinated efforts of a complex force composed of

multiple sensor systems, ships, submarines, aircraft, and weapons. National sensor systems cue specialized attack submarines and direct them to intercept enemy ballistic missile submarines. Ship-aircraft teams protect lines of communications to maintain freedom of the sea for civilian commerce and to permit accomplishment of other friendly force missions such as the establishment of protected havens for power projection and amphibious operations. The modern ASW force has been developing for more than 100 years.

Early Attempts

The first attempts to build submarines provoked little reaction from naval strategists and often proved more of a danger to the inventor than the intended target. Concern with underwater threats began to grow after the invention of the first successful self-propelled torpedoes by Robert Whitehead in the 1860s. The marriage of the improved descendants of Whitehead's weapons with the first viable submarines in the early years of the 20th century created a threat that changed the face of naval warfare.

Considerable work was done at the end of the 19th century to create defenses against torpedo attacks. Special torpedo boat destroyers were built, antitorpedo nets were hung around warships, and searchlights were installed to mark attackers for destruction by quick-firing guns, but little of this work would aid against the torpedo-armed submarine.

The most significant problem was detection of the submarine before it attacked so that it might be killed or neutralized. Then antisubmarine forces needed weapons capable of destroying a submerged submarine. Battered by U-boat attacks during World War I, the British worked to solve both of these problems.

World War I

Though some early efforts were amateurish, by early 1916 an effective purpose-built weapon designed for shipboard use—the depth charge—was available. The detection problem was much more difficult. Except for the top few meters, the ocean is not transparent, and searching its depths required the creation of whole new technologies.

In a pattern repeated later, the British Admiralty relied on scientific experts to help solve the problem. The Admiralty established the Board of Invention

and Research in mid-1915 with a combined scientific and naval staff to evaluate antisubmarine warfare proposals, and at the end of 1916, the Admiralty added the Anti-Submarine Division to deal with other issues, including sensor development. The division established protected shipping lanes near land and adopted new tactical approaches, including the extension of aircraft patrols over merchant shipping near Britain. Though not effective in attacking and sinking U-boats, early air patrols forced submarines to submerge and reduced their movement, and thus their ability to freely locate targets.

The Anti-Submarine Division's effort to develop a sensor that could penetrate the water sheltering German U-boats was incomplete at the end of the war. It would eventually yield an effective search sensor called *sonar* (sound navigation and ranging), which used acoustic echo-ranging to locate a submarine. Experiments were also conducted with magnetic detection of submarines, but during World War I, the most effective method for defending shipping from submarine attack was use of the protected convoy.

World War II

The most important advance of the interwar period was the installation of effective active sonar systems in escort ships. This was followed during World War II by the installation of radar and new antisubmarine weapons such as acoustic-homing torpedoes. Mass production of escorts and new ship types, especially small aircraft carriers, allowed effective protection of convoys and pursuit of offensive ASW operations using hunter-killer groups.

The Battle of the Atlantic was one of two significant ASW theaters in World War II. In the Pacific, the Japanese navy had much less success against Allied submarines as they devastated Japan's sea lifelines. One reason for the disparity was that in both the theaters the Allies read much of their opponents encoded message traffic; the Japanese naval culture, which assigned the antisubmarine warfare mission a lower priority than what were perceived to be more worthy pursuits for true sea warriors, also contributed to the Japanese inability to protect their merchant fleet.

The Cold War

The postwar submarine threat was largely defined for the North Atlantic Treaty Organization navies by the

buildup of a large Soviet submarine force based on captured German technology. Allied wartime tactics formed the foundation of postwar ASW; however, nuclear power soon revolutionized submarine warfare by creating a true air-independent submersible. This threat demanded improved sensors and weapons.

Dedicated maritime ASW aircraft were built to carry improved sonobuoys (sonar buoys; small, independent acoustic sensors), magnetic anomaly detection devices, radar, and ASW torpedoes. New long-range acoustic sensor networks (Sound Surveillance System) were installed on the ocean floor and connected to command and coordination centers. These centers analyzed the data collected from the sensor networks and used the information to direct the aircraft to their targets.

Surface ships were paired with helicopters that were able to carry sonobuoys, magnetic anomaly detection devices, radars, and ASW torpedoes. Surface ships provided data collection, display, and analysis capabilities; communications suites; additional sensors including electronic warfare receivers; and a long-range weapon, the antisubmarine rocket. The integrated ship-helicopter team, providing extended multisensor area coverage, became a basic component in ASW and other mission areas.

Addition of nuclear propulsion made submarines a more formidable threat at sea, but the introduction of ballistic missile submarines able to launch nuclear weapons from unknown locations with no warning, thereby threatening national decapitation, raised the consequences for ASW's failure to prevent national destruction. The creation of the ballistic missile submarine expanded the role of the torpedo-firing submarine. Arguing that the best hunter of one submarine is another submarine, nuclear attack submarine crews concentrated on finding and killing ballistic missile submarines.

Early Soviet propulsion systems were noisy, and most tracking operations used passive sonar systems. Improved quieting through the addition of sound absorbing material to the hull and machinery isolation required development of new search technologies that continued into the post-Cold War period.

Post-Cold War Era

The basic structure of antisubmarine warfare—now a part of undersea warfare in Western navies—mirrors

the late Cold War structure. Maritime patrol aircraft, attack submarines, and the ship-helicopter team, now aided by satellite, Surveillance Towed Array Sensor System, and high-power, low-frequency active and other sensors, still form the ASW foundation. Most improvements in antisubmarine warfare capabilities will result from incremental improvements in those areas.

Still, new research continues. Blue-green lasers, submarine-generated pressure waves, and infrared signatures on the ocean surface have been examined as tools and clues for submarine location, but acoustic methods are still important. After long reliance on passive sonar systems, quieter submarines have led to a renewal of interest in active sonar, especially low-frequency active sonars that also provide better search capability in shallow-water regions.

The nuclear submarine threat has receded somewhat after the Cold War. The most significant current threat is posed by improved diesel-electric submarines and nonnuclear air-independent propulsion submarines operating in shallow near-land areas where acoustic conditions are particularly difficult. Low-frequency active sonar is designed to help find submarines in these areas, and other new systems, like unmanned underwater vehicles, integrated sensor networks, scalable and deployable surveillance systems, advanced signal processing, and new warships and weapons, are under development.

ANZUS SECURITY TREATY

ANZUS refers to the security treaty signed in 1951 by Australia, New Zealand, and the United States. It is a military alliance that currently binds Australia and the United States and Australia and New Zealand together on defense planning issues in the Pacific. New Zealand and the United States are no longer mutually under the governance of ANZUS owing to a 1984–1985 dispute between the two nations over visiting rights for nuclear-armed or -powered American naval vessels at New Zealand ports. Regular meetings between the U.S. secretary of state and the Australian minister for foreign affairs take place annually. These bilateral meetings replaced the original ANZUS Council of Foreign Ministers meetings. ANZUS, unlike the North Atlantic Treaty Organization alliance system, does not have an integrated defensive command structure or forces. However, both nations' militaries take part in combined training exercises as well as maintaining cooperative defense facilities, primarily housed in Australia. This entry covers the origins, signing, effect, and current state of the ANZUS Treaty.

Background of and Reaction to ANZUS

The roots of ANZUS lie in the post–World War II era and were intimately tied to the crafting of a formal peace treaty with Japan and the onset of the Cold War in the Pacific. Both Australia and New Zealand exhibited deep concerns over a lenient peace with Japan due to fears about the possible resurgence of a rearmed Japanese nation as well as over possible economic competition from a revived Japan. These fears led both nations to hold out against American calls for a quick peace treaty. The United States wanted a peace treaty with Japan signed to integrate that nation into a defensive shield against the growing threat of communism in East Asia. These fears were heightened by the 1949 victory of communist forces in China, but the critical issue was the North Korean invasion of South Korea in June 1950. This produced great worry in Washington, D.C., that Japan would be targeted by communist forces, domestically as well as externally. The collapse of China placed Japan at the center of American post-war security policy in Asia, and thus the outbreak

of the Korean War was seen as a potential threat to those plans.

Both Australia and New Zealand viewed the American desire to conclude a rapid peace treaty with Japan as an opportunity to gain a formalized defensive commitment from the United States. Consequently, many historians have viewed ANZUS as a diplomatic quid pro quo. To garner support for the Japanese peace treaty, President Harry S. Truman sent Republican, and future secretary of state, John Foster Dulles on a tour of Pacific nations in February 1951. During meetings with the Australian and New Zealand officials in Canberra, Dulles acceded to a tripartite security agreement beyond the original scope of what the United States had hoped to agree to. Another point that led to the U.S. acquiescence to ANZUS was the agreement by the Australian government to supply possible reinforcements for the defense of the Middle East in the event of a war with the Soviet Union. For the Americans, ANZUS was initially more about global defense than regional defense. The ANZUS agreement was formally signed on September 1, 1951, in San Francisco as part of the formal signing of the peace treaty with Japan. Almost immediately, the treaty came under criticism from Great Britain and other Pacific nations, chief among them the Philippines.

The British protested their exclusion from any formal defensive or treaty arrangement in the Pacific. They argued that their involvement in fighting the communist insurgency in Malaya as well as their position as a senior member of the British Commonwealth secured their right to be represented in ANZUS. The Philippines and other Asian states viewed ANZUS as a distinctly Western or “White man’s pact” that sought to extend European influence in Southeast Asia and the Pacific. For its part, the United States did not resist the Filipino argument and actually sought the inclusion of the Philippines as well as Japan to transform ANZUS into a more general agreement among Pacific nations rather than the formalized defensive treaty for which Australia and New Zealand had pushed. The Australians, in particular, fought against both the British and Filipino efforts to be included in ANZUS because Canberra believed that any dilution of the treaty relationship with the United States would threaten the Australians’ close relationship with Washington that had been engineered over the course of World

War II and the early Cold War. The discussions among the ANZUS member states about the inclusion of the British and the Filipinos would serve as the basis for discussions for the creation of another, more inclusive, regional defensive system that would become the Southeast Asia Treaty Organization (SEATO).

ANZUS After 1951

Between 1951 and the early 1970s, ANZUS was not widely viewed as a significant regional diplomatic force. This was partly due to Australia and New Zealand remaining closely identified with Commonwealth diplomatic and defense efforts. The most controversial use of ANZUS forces in this period was the commitment of Australian troops and New Zealand support forces to South Vietnam in 1964. This was triggered by the inability of SEATO to meet the Laotian crisis of 1961–1962 and pushed ANZUS into an active phase of diplomatic and defense cooperation. The United States came to a greater appreciation of the support of its ANZUS partners because of their regional political power and also because, unlike other nations sending forces to Vietnam, Australia and New Zealand did so without monetary inducement. The reduced role of New Zealand in ANZUS stemming from the 1984–1985 disagreement with the United States in effect made ANZUS a Washington-Canberra bilateral agreement as New Zealand's importance dissipated from the American perspective. ANZUS provided the rationale for Australian support of American initiatives in the Persian Gulf War as well as in the 2001 invasion of Afghanistan and the 2003 invasion of Iraq. ANZUS today has become an institutionalized part of both U.S. and Australian foreign policies and remains central to the continued relationship between both the nations.

APPROPRIATIONS, MILITARY

The military appropriations process in the United States is a multistep process that involves key elements of the executive and legislative branches, resulting in congressional appropriation bills signed into law by the president. The budget process was first established by the Budget and Accounting Act of 1921, which requires the president to submit a federal government budget to Congress every year. Originally, the act created the Bureau of the Budget for this purpose; the name of the bureau was later changed to Office of Management and Budget (OMB). The Congressional Budget and Impoundment Control Act of 1974 (1974 Budget Act) specifies the role Congress plays in the budget process.

The budget funds all branches of the U.S. military: army, navy, air force, and Marine Corps. Salaries, benefits, training, arms, equipment, research, and operations related to the U.S. military are specified in the military budget. This entry explains the budgeting process, describes the roles of the Armed Services Committees, and defines terms related to appropriations legislation.

Budgeting Process

The starting point of the military appropriations process is the development of a military budget by the executive branch, under the control of the OMB. The president's budget is designed to accomplish three primary fiscal objectives:

1. Project the next fiscal year's government deficit (or surplus) by proposing aggregate spending levels and tax revenues.
2. Prioritize individual federal programs and groups of programs (called "budget accounts").
3. Communicate to Congress any changes to spending and tax policies recommended by the president. Such changes would include new tax laws and revisions to mandatory spending programs.

The major cabinet departments participating in the preparation of the military budget are the

Departments of Defense, Energy, and Treasury. Other major contributors of budgetary data include the Government Accountability Office (GAO) and the Congressional Budget Office. Since 1988, Defense Department and related budgets have been prepared on a *biennial* basis, that is, the budget represents program budget estimates for a 2-year period, in which fiscal year requirements remain separate and distinct.

The military budget authority specifies the proposed level of spending requested for various military programs and agencies and is part of the full government budget usually released in February for the following fiscal year beginning October 1. In 2008, the proportion of budgetary spending devoted to the military and homeland security was 23%. However, through fiscal 2009, much of the costs for the wars in Iraq and Afghanistan had not been funded through regular appropriations bills but through emergency supplemental appropriations. This changed in 2010, when most of the costs for the two wars were included in the president's budget.

The president's budget proposal is a critical input to congressional deliberation. The House and Senate Budget Committees are mandated by the 1974 Budget Act to draft budget resolutions by April 15, though this deadline is not enforced because the accompanying 1974 Budget Enforcement Act was allowed to lapse by Congress.

A distinction must be made between an *authorization* bill and an *appropriations* bill. Authorization bills arise from the budgetary process but only provide actual funding for *mandatory* programs—such programs (including military retirement benefits and veterans' disability benefits) do not require additional funding legislation. Budgeted *discretionary* spending, such as most military spending, is included in the authorization bill but requires subsequent congressional appropriations legislation before money can be spent on a nonmandatory budget item.

A budget resolution is a concurrent congressional resolution, and though binding on Congress, is not a law, cannot be filibustered in the Senate, and is not signed by the president. The total budget resolution is first sent to each body's Appropriations Committee. The budget resolution report includes the "302(a) allocation table," which divides the overall budgeted amounts into functional accounts. The military portion of the budget is designated as Function 50; Function 970 designates spending on

the international war on terror. The Appropriations Committee then assigns each function, via a procedure referred to as a "302(b) sub-allocation," to the appropriate congressional committee. The budget for the military functional account is reported via 302(b) sub-allocation to the House and Senate Armed Services Committees.

Draft resolutions are meant to create an overall cap on spending, including military spending. Each committee holds hearings, debates the president's budget, and often makes substantial modifications to it. The bills reported out by each committee must be approved by a full vote of the respective bodies. A House-Senate conference committee then reconciles the two bills, and the resulting conference report must be passed by another full vote of each congressional body to become binding on Congress.

Defense Department budgetary spending stood at more than \$685 billion for fiscal year 2010. This figure represents 19% of the federal budget and 28% of estimated tax revenues. If one includes non-Defense Department military spending, these percentages rise from 25% to 29% and 38% to 44%, respectively. The U.S. defense budget (not including spending for the wars in Iraq and Afghanistan, Homeland Security, and Veterans Affairs) is approximately 4% of the gross domestic product. Adding these other costs puts defense and homeland security spending at 5% to 6% of gross domestic product.

There are many elements of military spending that are not included in the Defense Department budget, including nuclear weapons, veterans' affairs and pensions, and counterterrorism. Total Defense Department budget requests for 2012 total \$676 billion.

The components of 2012 Defense Department budget, in descending order, are as follows:

- Operations and maintenance: 37%
- Military personnel: 25.8%
- Procurement: 20.4%
- Research, development, testing, and evaluation: 13.6%
- Military construction: 2.4%
- Family housing: <1%
- Revolving and management funds: <1%

Part of the U.S. Defense Department's budget is classified and is referred to as a *black budget*. Military projects not available for public scrutiny, known as

black projects or *covert operations*, are funded by black budgets. The estimate for the 2012 Defense Department black budget is \$59.3 billion (7.7%).

In 2012, the budget percentages allocated to each of the armed forces services is 25.9% for the army, 29.1% for the navy and Marines, and 27.1% for the air force. The remaining 17.9% of the military budget was allocated to defense-wide spending. For the 2011 fiscal year, the top five budgeted amounts for defense-related programs were (1) F-35 Striker aircraft, (2) ballistic missile defenses, (3) *Virginia*-class submarines, (4) brigade combat team modernization, and (5) Aegis-operating destroyers.

Defense Appropriations

The power of appropriation derives from the U.S. Constitution, which in Article I, Section 9, provides that “no money shall be drawn from the Treasury but in consequence of appropriations made by law.” The House and Senate Armed Services Committees are charged with establishing, continuing, and/or modifying the funding ceilings on each defense program and providing the budgetary authority to appropriate funds for use by federal agencies. In addition, Congress often leverages its authority to help mold defense-related policies. The sweep of the Armed Services Committees’ prerogatives allows them to effect changes to any number of Pentagon priorities and procedures, such as procurement for materiel and services, personnel policy within the Defense Department, and timely reporting to Congress from executive branch departments and agencies charged with carrying out defense and homeland security policies. For instance, Congress can kill a weapons system, close down military bases, or mandate armed forces troop-staffing levels.

Political considerations certainly can play a role in deciding the fate of specific defense programs and systems. For instance, a weapons system that has geographically dispersed the components built by a network of subcontractors may be easier to preserve than one that is localized in just one area. Nonetheless, obsolete or overpriced weapons programs can be terminated any year by Congress: In 2009, the F-22 stealth fighter was not included in the 2010 Authorization Act signed into law, effectively killing this weapons system.

A standard appropriation bill is related to a single fiscal year—the funds have to be obligated

during the fiscal year for which they are provided; they lapse if not obligated by the end of that year. However, no-year (available until spent) and multi-year appropriations are permitted.

The Armed Services Committees have historically reserved the May–June time period prior to the start of the next fiscal year to deliberate and mark up defense-related appropriation bills. By precedent, appropriations originate in the House of Representatives. The House Armed Services Committee holds hearings, debates, and marks up its appropriation bill. On passage by the full House, the Senate Armed Services Committee takes up the House bill and produces its own version.

Rules in the Senate allow any member to raise a budget *point-of-order* on any bill in which budget allocations are exceeded or tax revenues are cut below budget minimums. Thereafter, three fifths of the Senate must vote in favor to adopt the rule that is the subject of the point-of-order. (The House only requires a majority vote to override a budget point-of-order.) This is an important self-enforcement mechanism to keep appropriations within budgetary constraints.

Another budget constraint mechanism, PAYGO, was reestablished by legislation in 2007. Simply stated, PAYGO disallows any change to spending or taxing that increases the federal deficit. Any increase to the deficit must be revenue-neutral or offset by savings in other programs. In 2009, the rule was modified to provide for emergency expenditures. PAYGO does not apply to mandatory spending; discretionary spending, such as spending on defense, is subject to PAYGO rules. A point-of-order can be raised for any bill that violates PAYGO rules.

The ultimate budget constraint is a presidential veto of an appropriations bill. The president may return an unsigned bill to Congress within 10 days of receipt to effectuate a veto. Congress can override the veto with two-thirds majorities in both houses.

After Senate passage, the House and Senate Defense Appropriation Bills are reconciled into a single report by a House-Senate joint conference and then voted by each body. The bill is then sent to the president for the president’s signature, which when affixed provides the required authority for the executive branch to spend funds on the approved programs.

Appropriations for nuclear weapons programs are drafted by the House and Senate Energy and Water Appropriations Subcommittees and are

included in the final Appropriation Act signed by the president.

Supplemental Appropriations and Continuing Resolutions

The House and Senate Defense Appropriations Subcommittees throughout the year can prepare *supplemental* appropriation bills to provide funding requested outside the usual authorization and appropriations procedure. Supplemental appropriation acts provide additional spending authority during the current fiscal year when regular appropriations are insufficient to finance activities not provided for in the regular appropriation process.

Emergency supplemental appropriations are nominally utilized for unexpected expenses and as such are not part of the normal budgetary process. However, the wars in Iraq and Afghanistan were completely funded via emergency supplemental appropriations during the years 2003–2009. These incremental costs are estimated at no less than 1 trillion dollars over the course of both wars and were in addition to normal military spending. Beginning in 2010, the wars in Iraq and Afghanistan were categorized as “Overseas Contingency Operations” and included in the budget. There was, however, additional military funding sought by supplemental appropriations. For the fiscal year 2010, supplemental war funding amounted to \$37.1 billion but included money for the Afghanistan conflict as well. The total costs of war-related supplemental appropriations represented 4% of federal spending for the years 2001–2008, according to the Congressional Budget Office.

A *continuing resolution* (CR) is a type of appropriations legislation that acts as a stopgap when spending legislation has not been approved before the start of a new fiscal year. Continuing resolutions allow money to be spent at the same rate as previously authorized, until a new appropriations bill is enacted. Both houses of Congress must pass, and the president must sign, a continuing resolution before it takes effect. The extra time provided by a continuing resolution gives Congress the opportunity to resolve conflicting political views on levels and types of spending without jeopardizing important federally financed programs, including military programs. In recent history, five CRs on average have been passed each fiscal year.

Fiscal Cliff and Other Uncertainties

At the time of this writing, the outcome of the so-called U.S. fiscal cliff budget deficit reduction remained unresolved. The Budget Control Act of 2011 mandates substantial cuts to many discretionary portions of the U.S. budget as part of a deficit reduction scheme. The magnitude of proposed spending cuts is \$1.2 trillion over a 10-year period, with the first substantial cuts occurring on January 1, 2013. Half of all cuts, about \$55 billion per year, will come from military spending in a process called *sequestration*. This will lower project defense discretionary spending to 1.5% annually for the 2013–2021 periods. By way of comparison, this spending grew at an average annual rate of 8.2% from 2000 to 2011, which included spending on the wars in Iraq and Afghanistan.

Whatever the outcome of the sequestration debate, large deficits and fiscal uncertainties will no doubt exert a drag on the growth of military spending over the next decade.

ARAB AMERICANS

The term *Arab American* refers to the more than 4 million people living in the United States who trace their ancestry to any of the 22 nations in the Middle East and North Africa that are members of the Arab

League. Communities of immigrants from Arabic-speaking countries began forming in the late 1800s, mostly in the industrial cities of New York and Boston, but immigrants from what was then known as Greater Syria (now Lebanon, Palestine, Jordan, and Syria) quickly established enclaves in many major cities, such as Houston, Pittsburgh, Detroit, San Francisco, Birmingham, and Minneapolis, and smaller towns in Iowa, North Dakota, Oklahoma, and other states. Arabs continue to immigrate to the United States because of economic opportunities, chain migration, or because they are refugees of war and political violence. Religion is an important marker of identity for Arab Americans. The majority of Arab Americans are Eastern Orthodox or Catholic Christian, and a large percentage are Shi'a or Sunni Muslim, with smaller numbers of Druze and other sects. Because of this diversity and the fact that the U.S. Census does not recognize Arab or Middle Eastern as a distinct racial category (all people of Middle Eastern descent are officially classified as White), exact numbers are difficult to determine, both for the general population of Arab Americans and for those who serve or have served in the U.S. military. This entry discusses the role of Arab Americans in the U.S. armed forces.

Early Military Service

Although there has never been a lengthy historical investigation of Arab Americans in the military, historians and Arab American organizations recognize the long history of Arab American service in the armed forces. The Arab American National Museum in Dearborn, Michigan, lists that 13,965 Arab Americans served in World War I, most of whom were Christians from Greater Syria, a number that comes from a 1924 study by a Princeton professor named Philip Hitti. This figure is often cited as evidence that large numbers of Arabs, both Christian and Muslim, have been living in and fighting for the United States for at least 100 years. In fact, Hitti claimed that the Syrians contributed more soldiers to World War I than any other ethnic community in the United States at that time. Regardless of the accuracy of this claim, Arab American leaders and writers often refer to this World War I figure to reinforce the notion that Arabs can be and are loyal, patriotic Americans.

Some historians and organizations trace the roots of Arab military service in the United States even further, claiming that hundreds or even thousands of Arabs and Muslims, mostly former slaves from North Africa, fought in the U.S. Civil War. In fact, there is evidence that a former slave from Morocco served as a guide for General Thomas Sumter during the Revolutionary War. Again, although it is difficult to ascertain the accuracy of figures from these early U.S. wars, many Arab Americans are proud of their community's military record. As Arabs living in the United States have often been the victims of discrimination and suspicion as a result of U.S. foreign policy interests in the Middle East, military service is one visible method of demonstrating loyalty to the United States.

While it is true that people of Arab ancestry have been living in the United States for centuries, to claim that there is a continual and singular Arab American presence in the United States and its military since the U.S. colonial period is to elide the historical differences between slaves from North Africa who fought in the Civil War; Syrian immigrants who fought in World War I; second- and third-generation Lebanese Americans who fought in World War II, the Korean War, and the Vietnam War; and Arab Americans from a dozen different nationalities who are veterans of the U.S.-led Gulf Wars. In addition to these generational and national differences, there is a vast diversity in religious traditions, economic and citizenship status, political viewpoints, and self-identification (as some Arabic-speaking people do not readily identify as Arab). All of these factors, combined with the fact that the military did not record religious or ethnic/racial demographics, make it nearly impossible to determine exact figures of Arab American veterans. Most of the figures on Arab American military service, including the oft-cited 13,965 number from World War I, were determined by amateur and professional historians who scoured local and national military records, relying mostly on last names as a determining factor in a person's Arab heritage. This is problematic for numerous reasons, including the fact that many non-Arab Muslims (the majority of Muslims worldwide and in the United States are not Arab) have Arabic or Arabic-sounding last names and that many Arabic-speaking Christians

changed or Americanized their names as early as the 1880s.

General Military Experience

Even though Arab Americans are too diverse to speak of monolithically, it is possible to generalize about some aspects of their history with the U.S. military. In many ways, the experience of the Arab American community with military service is similar to other ethnic groups: Arab American newspapers, churches, and community organizations celebrated their “Syrian doughboys” during World War I, extolled the virtues of purchasing Liberty Bonds throughout both World Wars, and memorialized their veterans and created Veterans of Foreign Wars’ posts in the decades after World War II. Institutions like the Arab American National Museum and organizations like the Association of Patriotic Arab Americans in Military, founded by the U.S. Marine Jamal Baadani, continue to highlight the military service of Arab Americans as an important part of their overall history.

Stories of World Wars I and II veterans abound in the many regional and national directories that Arab American organizations published and in the histories that individuals, communities, churches, and mosques have recorded since the early 1900s. A good example is the 1943 Syrian-Lebanon Directory of Michigan, which was dedicated to the “American Boys of Syrian-Lebanon Origin, fighting for the Noble cause of Democracy” and included numerous pictures of men in military outfits and dozens of advertisements imploring the reader to purchase war bonds. In addition to print materials, many Eastern Orthodox and Catholic churches have plaques, memorials, or even associations that honor their veterans, such as the “Four Star American Legion Post” of St. John Maron Church in Williamsville, New York, named for the four Lebanese American soldiers from the parish who died in World War II.

The diversity of Arab American religious identity is also evident in the history of religious recognition in the military. It was Arab Americans who first pushed for recognition of Eastern Orthodox (Sam Matook of Rhode Island during World War II) and Muslim (Abdullah Igram of Iowa in the early 1950s) on dog tags instead of the previously used

“X,” which denoted no religion. As late as 1998, there were only three Muslim chaplains across all branches of the armed forces. Muslim chaplains did not even exist until after the Persian Gulf War, even though Arab Muslims have been serving since World War I or before. The first Muslim chaplain was an African American Muslim, but Arab American Abdullah Hulwe, who began his career in the U.S. Army as a mechanic, completed his education and became the only Muslim chaplain in Iraq in 2005.

Arab American Military Service, 1991 to the Present

According to the Association of Patriotic Arab Americans in Military, there are more than 3,500 Arab American men and women in the military as of 2011. Because of the broad range of ways that Americans with Arab ancestry self-identify, the exact number is difficult to ascertain.

James Zogby, director of the Arab American Institute, is quoted in a 1991 *Economist* article as saying,

Two words have collided and both of them are ours. . . . Suddenly in the spotlight, Arab-Americans are torn between the urge to stress their loyalty and the alarm they feel about the latest turn in Middle East events. They are represented both in the armed forces and in the peace marches.

Although this quote refers to the Persian Gulf War, it aptly applies to the position of Arab Americans within the Global War on Terrorism.

Especially after the Persian Gulf War, Arab American military personnel have been the focus of media attention for a perceived inherent conflict in serving in the military. Newspaper and magazine articles tend to single out a soldier of Arab ancestry and highlight the tensions that could exist while fighting for the United States in the Middle East. While there have been some thoughtful approaches to these issues, namely, Alia Malek’s profile of Lance Corporal Abraham Al-Thaibani in her 2009 book, *A Country Called Amreeka*, media coverage can sensationalize the position of Arab Americans in the military, which draws on the long history of Arab American positionality in the United States. One veteran of the Persian Gulf War, interviewed during

research for the Arab American National Museum's exhibit "Patriots & Peacemakers: Arab Americans in Service to Our Country," expressed concerns about what prolonged war does to the perception of Arabs among U.S. troops and also reiterated his "unwavering patriotism" that drove his decision to serve in the military in the first place.

While it is important to note that some soldiers might be conflicted, it is dangerous to generalize that all soldiers of Arab ancestry (who may or may not identify as Arab American) would be reluctant to fight in a Middle Eastern country. Furthermore, just as the Arab American community is linguistically and religiously diverse, the attitudes toward war and military service are equally diverse. In the early 1900s, the racial classification and citizenship status of Arabs were a matter of debate in several court cases. Later in the century, U.S. political and economic interests in the Middle East worked to turn popular culture and popular opinion in the United States against Arabs. This perilous position continues today with the various incarnations of the USA PATRIOT Act and military engagements in the Middle East, and the consequential heightened suspicion of Arabs, particularly Arab Muslims.

Arab Americans have held military rank from privates to four-star generals, John Abizaid and George Joulwan. While it is true that serious discrimination of Arab American service personnel has occurred, it is not necessarily the experience of every soldier of Arab, or even Muslim, descent. Many more service personnel of these backgrounds describe their service as any of their colleagues would, with anecdotes ranging from horrific to humorous, from having to deal with minor annoyances like missing their families to significant problems with injuries or posttraumatic stress disorder.

The Arabic language has become increasingly important to the U.S. military, and Arab Americans have contributed to crucial roles in translation and language instruction. According to Aladdin Elaasar, Arabic became the biggest language program at the Defense Language Institute, where he had formerly worked as an instructor, following the attacks of 9/11. Many Arab American service members became interested in military careers because of their language skills, and the U.S. military and other government entities (notably the Central Intelligence Agency) have been strategically appealing to Arab

Americans for their language skills and cultural competency. For example, in 2005, a number of Arab American veterans received letters from the Marine Corps asking them to utilize their language skills by enlisting or reenlisting in the marines. In some instances, the persons receiving these letters were 60 and 70 years old.

Conclusion

While some view the service of Arab Americans as controversial in the context of current U.S. wars abroad, their presence has led to better cultural understanding among their fellow soldiers and continued dialogue about military actions. Like Arab Americans at large, the stories of military personnel are numerous and diverse. There are veterans whose stories have been told in history books, such as Kasaam Ramadan, an Arab American Muslim who was granted citizenship in 1919 after his service in World War I, or have been enshrined in the Arab American National Museum, such as Jamal Baadani. But countless others have not yet shared their stories, or their stories may be complex and not celebratory of the U.S. military, but each new story shows how difficult it is to generalize about the Arab American military experience.

ARCHIVES, MILITARY

Military historians have a variety of choices when researching military archives. Military archives range in size from the largest, the National Archives and Records Administration, to the smallest state and local historical societies. The various armed forces history offices and archives as well as universities, military academies, and war colleges provide ample records for the student of military history. This entry describes many of the resources available for researching military records and other information, including online resources.

National Archives and Records Administration

The largest collection of federal military records is located in the National Archives and Records Administration (NARA) at Archives I and II. Established in 1934 by President Franklin D. Roosevelt, NARA holds records dating back to 1775. Archives I is located in Washington, D.C., and holds records of the U.S. Army, Navy, Coast Guard, and Marine Corps. Most military personnel and pension records prior to 1917, including records of Confederate veterans, are located at Archives I. In addition, one can find navy deck logs, army unit records, quartermaster records, and campaign medal records to name a few.

Archives II is located in College Park, Maryland, and holds modern military records from World War I through Vietnam. A list of record groups (RG) can be found on the National Archives website, www.nara.gov. A few of the more interesting RGs follow. RG 120 covers the American Expeditionary Forces (World War I) and includes unit records. RG 92 (Office of the Quartermaster General) has detailed burial files of World War I soldiers. Records of the U.S. Marine Corps are in RG 127 and include command chronologies. RG 38 (Office of the Chief of Naval Operations) includes very detailed action

reports and ship war diaries from World War II. RG 18 (records of the Army Air Forces) contains mission reports of bomb groups and other air units. In recent years, RG 226 (Office of Strategic Service) records were declassified; most recently, NARA released Office of Strategic Services' personnel records filed by name. RG 407 (Adjutant General's Office) contains army unit records, including after-action reports, combat journals, and maps. Finally, Archives II has a complete collection of foreign military studies compiled by high-ranking German officers after World War II as well as microfilm collections of captured German and Japanese documents that were returned to their respective countries after the war.

In addition to textual records, Archives II has the Still Pictures Branch, the Cartographic and Architectural Branch, and the Motion Picture, Sound, and Video Branch. The Still Pictures Branch has the Matthew Brady photographic collection as well as the complete Signal Corps photo collection and official navy photographs and some Department of Defense photographs. The Cartographic and Architectural Branch holds military maps, including Army Map, Service maps, and the corresponding aerial reconnaissance photographs on rolls of oversize negatives. Finally, the Motion Picture, Sound, and Video Branch holds thousands of combat and military films from World War I through the Vietnam War. Much of the National Archives collection can be searched online on the NARA website.

National Personnel Records Center

The National Personnel Records Center (NPRC) in St. Louis, Missouri, is the primary source for 20th-century military personnel records. The NPRC holds millions of records of discharged military personnel from all services as well as their medical records. A fire in 1973 destroyed 80% of army records for soldiers discharged from November 1912 to January 1960 and 75% of air force records of personnel discharged from September 1947 to December 1964. There are some alternative methods of finding certain information, which are outlined on the NPRC website, www.archives.gov/st-louis. Only the veteran or next of kin can request complete files, when available, but researchers can obtain information not protected by the privacy act.

Presidential Libraries

Presidential libraries are another valuable source of records relating to American military history. Today, there are 13 presidential libraries covering the administrations of Herbert Hoover through George W. Bush. The libraries contain records relating to the military service of the presidents who served and records of some of their military advisors. For example, the Roosevelt and Truman Libraries contain valuable information on World War II and the Korean War. The Eisenhower Library contains volumes of records relating to his military career, including the Supreme Headquarters Expeditionary Force records on D-Day, oral histories with his military advisors, and his presidential records on the Korean War. Records relating to the Vietnam War can be found in the libraries of Eisenhower through Nixon.

Naval History and Heritage Command

The Naval History and Heritage Command in Washington, D.C., History and Archives Division, is the main repository of records relating to the operational history of the U.S. Navy. The bulk of the collection relates to the post–World War II navy and includes command reports, immediate office of the Chief of Naval Operations records, and some disestablished command records. The Operational Archives also has personal papers of naval personnel dating back to the 19th century, oral histories, official biographies of navy officers, and manuscripts. The aviation and ship records include command chronologies and deck logs (post–Vietnam War). In recent years, many collections have been transferred to the National Archives.

Air Force Historical Research Agency

The Air Force Historical Research Agency at Maxwell Air Force Base, Alabama, maintains a collection begun in World War II of more than 70 million pages relating to U.S. Air Force history. The repository maintains unit histories, unit lineage and honors, an oral history collection, end-of-tour reports, and personal papers of influential air force personnel. It also has records relating to the British Air Ministry and the German air force. Copies of the agencies' records are available on 16-mm microfilm at the National Archives.

Army Heritage and Education Center

The Army Heritage and Education Center (AHEC) at Carlisle, Pennsylvania, maintains an extensive

collection of unit histories, manuscripts, maps, photographs, oral histories, and personal papers. The center compiled valuable surveys from veterans of the Spanish-American War, World War I, World War II, the Korean War, the Vietnam War, the Cold War, and the post–Cold War era. A voluminous collection of photographs, including the collection of the Massachusetts Commandery of the Military Order of the Loyal Legion, a Civil War veterans' organization, is also available to researchers. Personal papers include those of Generals Matthew B. Ridgway, Benjamin O. Davis Sr., William C. Westmoreland, Eric K. Shinseki, and others. AHEC is also a source for the papers of veterans' organization such as the Battle of the Bulge Historical Association. Finally, the center maintains the largest collection of army unit histories.

Center of Military History, Historical Resources Branch

The U.S. Army Center of Military History (CMH), Historical Resources Branch, in Washington, D.C., maintains a library and an archive. The branch holdings consist of more than 57,000 items that support the publishing mission of the CMH. Collections of note are the *Annual Reports* of the Secretary of War/Secretary of the Army, complete War Department and Department of the Army general orders, station lists, and army registers for biographical information on officers. The CMH also maintains general officer biographical files. One of the most important RGs is the Historical Manuscript Collection, which consists of mostly unpublished narrative histories compiled by the CMH or field historians in support of the Official History of the U.S. Army. Another important collection is the Annual Historical Reports, compiled by all major commands. Finally, the CMH conducts and collects oral histories compiled by combat historians beginning in 1965. In recent years, the CMH has been digitizing its holdings and placing them online, so it is advisable to consult its website, www.history.army.mil/, before visiting it.

Marine Corps History Division Historical Reference Branch

The Marine Corps History Division Historical Reference Branch at Quantico, Virginia, contains more than 15,000 biographical files of prominent U.S. Marines. The branch also has subject files on

topics from the founding of the Marine Corps to the present. Unit files and geographical files contain working files on Marine Corps units, lineage and honors, and commanders, as well as information on installations and locations where marines served in war and in peace. Microfilmed muster rolls, unit diaries, and rosters prior to 1966 are also available.

Coast Guard Historian's Office

The Coast Guard Historian's Office in Washington, D.C., maintains more than 500,000 images and some documents. The Cutter Files contain photographs, news clippings, brief histories of each cutter, and some operational files. The historian also maintains biographical files and photographs of senior officers and famous personnel. The manuscript collection contains personal papers, photographs, and scrapbooks of famous personnel, including former commandants. In addition to documents, the office has several thousand books, manuals, and directives. Deck logs of Coast Guard ships are located at Archives I in Washington, D.C.

Military Academies

The Military Academies and their alumni associations are another good source of information on military personnel since many graduates donate their papers to the academy libraries. In addition to personal papers of general officers and civilians who were instrumental in air power development, the Air Force Academy Special Collections' Branch holds the archives of the Stallag Luft III veterans and the Colonel Richard Gimbel Aeronautical Library, which contains more than 5,000 books, manuscripts, and papers dating back to the 15th century. The Naval Academy has a collection of personal papers, while most of the Coast Guard Academy collection, except for a small collection of manuscripts, photographs, and annual reports, is located in the Coast Guard Historian's Office. The United States Military Academy Archives collects and maintains records relating to the official business of West Point, and the Special Collections holds more than 1,500 linear feet of manuscripts as well as maps, photographs, rare books, and the Sylvanus Thayer collection.

Naval War College Library Naval Historical Collection

The Naval War College Library Naval Historical Collection, located in Newport, Rhode Island, was

established in 1969. The library contains 304 manuscript collections, 460 oral histories, and the personal papers of Alfred Thayer Mahan and other notables. The Air War College and Army War College collections are at the Air Force Historical Research Agency and AHEC, respectively. The Special Collections, Archives and History Branch of the National Defense University Library in Washington, D.C., has a collection of personal papers of flag rank officers, photographs, rare books, maps, and artifacts. The personal paper and archive collection are currently being digitized and indexed.

Library of Congress Manuscript Division and the Veterans History Project

The Library of Congress Manuscript Division and the Veterans History Project (VHP) are two areas of interest to military historians. The Manuscript Division holds the papers of military personalities such as Ira Eaker, Carl Spaatz, Adolphus Greely, Samuel Eliot Morison, and the U.S. Army 92nd Infantry Division Collection. One of the most important collections is the Naval Historical Foundation Collection established in 1926 and deposited into the Library of Congress in 1949 as part of a partnership agreement. Today, there are more than 300 separate groups of papers covering naval history, and the Naval Historical Foundation continues to locate and add manuscripts to the collection.

The VHP collects oral history interviews with veterans and civilians who helped support war efforts and preserves them in the American Folklife Center. The project has interviews with veterans of World War I, World War II, the Cold War, the Korean War, the Vietnam War, the Persian Gulf War, and the Global War on Terrorism. Interviews with civilians include factory workers, United Service Organizations (USO) members, and defense contractors. Some of the interviews are available online, and they have an extensive finding aid. In addition to oral histories, the VHP also collects diaries, letters, and photographs.

University Libraries

University libraries are another valuable source for obtaining military records. The Vietnam Center and Archive at Texas Tech is the largest source of records on the Vietnam War outside the federal government. They actively collect, process, and make available donations from veterans and veterans' organizations such as Air America and have an ongoing oral

history project. The Hoover Institution at Stanford University holds the papers of many military personalities such as Generals Edward Lansdale, Joseph Stilwell, and Albert C. Wedemeyer. Other universities such as Rutgers, the University of Tennessee in Knoxville, and the University of North Texas maintain veterans' oral histories. Florida State University has the Institute on World War II and the Human Experience, and Williams College holds the papers of Major Charles Whittlesey of the "Lost Battalion." It is always worth checking university libraries because it only takes one collection to fill a gap in research.

Other Countries

Most nations have archives that can be good sources of military records. The United Kingdom's National Archives at Kew holds military records, including records from American warships captured during the American Revolution and the War of 1812, and British prize court records hold papers captured in American ships. The military records of France are maintained by the Ministry of Defense at two locations, in Vincennes and Châtellerault. French Navy records, for example, contain dossiers on John Paul Jones, Pierre Landais, and Joshua Barney. The German Federal Archives (Das Bundesarchiv) in Freiburg holds German military records from 1867, the Berlin-Lichterfelde branch holds military records up to 1866, the Berlin-Wilmersdorf branch holds military films and film-related documents, and the Koblenz branch holds the photographic collection.

Searching for Records

Overall, researchers should be resourceful when searching for military records. The larger federal archives are generally the first place one should consult, but do not discount state and local libraries, archives, and museums. In many cases, veterans donated their personal papers to their hometown libraries, historical societies, or their veterans' associations. Finally, always call in advance before you make a trip to an archive or library.

ARLINGTON NATIONAL CEMETERY

Across the Potomac River from the Lincoln Memorial and grand buildings representing American democracy is one of the most symbolic parcels of land in the United States. Arlington National Cemetery covers 624 acres and is the final resting place of American presidents, Supreme Court justices, famous historical figures, deceased veterans, and legions of American soldiers from all U.S. wars. More than 4 million people visit Arlington National Cemetery each year for a variety of reasons. Some go to walk the beautiful parklike terrain and read the names that chronicle a nation's history, some to pay respect to military heroes, others to visit a deceased family member, and many to see a fallen family member or a friend laid to rest after dying in service of the country. The new graves remind visitors of the true purpose of Arlington National Cemetery—a kept faith between all who serve and the U.S. government—that their contributions will

never be forgotten. This entry discusses the history of Arlington, some of Arlington's popular sites such as the Tomb of the Unknowns, and recent controversies.

The land that is now Arlington National Cemetery was originally purchased in 1802 by George Washington Custis and served as a functioning plantation, with the grand Arlington House as its nerve center. The plantation eventually passed to Custis's daughter Mary Custis Lee, wife of West Point graduate Robert E. Lee. The Civil War divided the nation in 1861, and Lee resigned his commission in the U.S. Army and offered his services to the Confederate States of America, with which the Commonwealth of Virginia had sided. This decision forced the Lee-Custis family to abandon their beloved home. The property's location within artillery range of the capital made it strategically important. The federal army occupied the property immediately after the Lees's evacuation.

By 1864, the Union war dead overflowed cemeteries and hospitals around Washington, D.C. Quartermaster General Montgomery Meigs decided to appropriate 200 acres of the Lee's Arlington estate for a cemetery. Within the same property was a self-sustaining settlement of more than 1,000 freed slaves established by the government known as Freedman's Village. The plantation of the Confederacy's favorite family became both a burial ground for their enemies and a national symbol of the Union's cause.

The sinking of the USS *Maine* and U.S. entrance into the Spanish-American War in 1898 facilitated a national reconciliation between the North and the South. Following the war, President William McKinley took steps to make Arlington a national symbol, not just a Northern one. In 1900, he authorized a Confederate plot to be created within the cemetery. The plot was arranged differently than all others in the cemetery and contains the remains of soldiers who fought against the Union. A large memorial stands in the center of their graves. It is one of the more controversial sites in the cemetery; it symbolizes a complex period in the nation's history that is still debated. On Memorial Day in 2009, despite appeals, President Barack Obama continued a tradition established by Woodrow Wilson by placing a wreath at the Confederate Monument. President Obama did, however, also place a wreath on a monument honoring the service of African Americans in the Civil War.

In addition to the historically preserved Arlington House, there are other sites for visitors to experience. Among the most moving of these is the Tomb of the Unknowns (a monument dedicated to unidentified American soldiers). This tomb housed the remains of one unidentified soldier from the World Wars, the Korean War, and the Vietnam War (in 1998, this soldier was identified and moved to a family plot). Since 1948, the 3rd U.S. Infantry Regiment, "The Old Guard," has stood constant guard over the remains. Before then, the Washington Provisional Guard performed the sacred duty. For all interments within the large marble tomb, U.S. presidents have presided over the ceremonies. Each Memorial Day, a representative from the current administration

A soldier in the 3rd U.S. Infantry Regiment (The Old Guard) measures 1 foot with his boot and places a flag in front of a grave marker at Arlington National Cemetery during the annual tradition "Flags In," May 21.

Source: U.S. Army.

lays a wreath in honor of the unknowns. Every day, hundreds of visitors solemnly gather to watch the changing of the guards at each half hour. The large outdoor Memorial Amphitheater is connected to the Tomb of the Unknowns; it holds state funerals and holiday ceremonies.

The grave of assassinated president John F. Kennedy is highly frequented within Arlington. President Kennedy is joined by his wife, two of their infant children, and his brothers, Senators Robert and Edward Kennedy. An eternal flame burns over JFK's grave to symbolize the enduring legacy of one of the nation's most beloved presidents. The panoramic view of the capital city from his grave site has been called one of the most beautiful in the city.

Like many other sites that represent a national identity, Arlington National Cemetery has not been without controversy. There have been debates ranging from interment qualifications to the variety of headstones offered for placement. The ever-decreasing space and the expected influx of passing World War II veterans created more rigid ground burial qualifications in 1967, although inurnment in the Columbarium is more accessible. Increased burial qualifications have at times placed burial decisions in the political realm, causing presidents to step in and provide waivers for special considerations.

The terrorist attacks of 9/11 took the lives of both uniformed military personnel in the Pentagon and civilian Department of Defense employees, who were not eligible for burial in Arlington. Many of the civilian employees were buried in Arlington, nonetheless. This sparked a very public debate. In 2008–2009, a movement was begun to end funeral policies that excluded low-ranking soldiers from the full funeral ceremonies afforded to high-ranking officers. With the unconventional warfare taking place in the Middle East during the period, it seemed unfair to follow segregating funeral policies. Beginning in 2009, all soldiers being interred in Arlington received the same honors.

In 2010, national media frenzy surrounded Arlington when it was discovered that hundreds of graves were mislabeled or missing. This shook the unwavering faith that many Americans placed in Arlington and caused administrative changes. The U.S. Army began an extensive mission to map the entire cemetery and assess exactly what the extent of the mishandling was. Regardless of the many recent controversies, Arlington remains one of the most powerful symbols of service and sacrifice to the United States of America. Careful planning and land acquisitions have ensured that the cemetery will remain active until approximately 2060; there are

Grave of John F. Kennedy and Jacqueline Lee Bouvier Kennedy Onassis in Arlington National Cemetery.

approximately 25 new burials each day in Arlington over a 5-day week.

ARMED FORCES RADIO AND TELEVISION SERVICE

The Armed Forces Radio and Television Service (AFRTS) offers 24-hour access to news, information, and entertainment. AFRTS, headquartered in Fort George Meade, Maryland, operates as part of the Department of Defense (DOD). The service communicates DOD policies, priorities, programs, goals, and initiatives. AFRTS provides stateside radio and television programming through various services to U.S. service members and DOD civilians and their families serving outside the continental United States. The AFRTS operation is enabled by three branches, of which the American Forces Network (AFN) is the operational arm: The Radio and Television Production Office, the Pentagon Channel News-Center, and the Defense Media Center (DMC). This entry examines the history and services of the AFRTS and the recent impact of the Internet and social media. The entry concludes with a discussion of AFRTS's satellite networks and the scale of its operation.

Historical Roots

The birth of the AFRTS can be traced to early military radio stations appearing in the Panama Canal Zone, Philippines, and Alaska just prior to World War II. The success of these early radio stations paved the way for the Armed Forces Radio Service (AFRS). The War Department officially established

AFRS in 1942 with a mission of providing programming, shortwave service, and broadcast equipment for U.S. military locations overseas. The AFRS grew significantly from there, with the addition of Armed Forces Television at Limestone Air Force Base, Maine, in 1953 as an experimental station. In 1954, the television mission was officially recognized, and AFRS became AFRTS. The AFRTS grew from then on, providing radio and television service to U.S. combat forces overseas, quickly expanding during the Korean and Vietnam Wars. During Operation Desert Shield/Desert Storm, AFRTS provided service to U.S. combat forces. In a few short months, AFRTS built an extensive radio network and established a limited television service in the desert, providing familiar news, sports, and entertainment programs to the thousands of troops deployed to the region. More recently, AFRTS has deployed to Somalia, Haiti, Croatia, Bosnia, Hungary, Macedonia, Albania, Kosovo, East Timor, Central America, and the Operation Enduring Freedom and Operation Iraqi Freedom areas of operations.

The Services

The AFRTS is composed of several elements serving in different roles but working toward a unified programming.

The Radio and Television Production Office

The Radio and Television Production Office produces, acquires, and approves radio and television spot announcements for AFRTS and the Pentagon Channel. As AFRTS and the Pentagon Channel have a selective audience, their commercials are tailor-made for the audience at hand. The Radio and Television Production Office is the only activity within the AFRTS system authorized to release spots for worldwide broadcast.

The Pentagon Channel (Television and Online)

The Pentagon Channel, launched in the United States on May 14, 2004, is the newest arm of AFRTS. The DOD-operated internal communications channel is also distributed by satellite overseas as a channel of the AFRTS and domestically to military bases, reserve centers, and National Guard armories. A growing number of U.S. satellite and cable carriers are also making the channel available to their viewers. The Pentagon Channel's goal is to

provide military viewers timely access to news and information about the DOD.

The Defense Media Center

The DMC is run and operated by military broadcasting personnel, as well as civilian employees, ensuring 24-hours-a-day programming. A variety of news, information, and sports programs from all the major networks is transmitted live from the DMC to the various arms of the AFRTS.

The American Forces Network

In addition, the AFN provides a mix of American television programs seen stateside on major broadcast networks as well as major cable channels. Different AFN services are carefully designed to serve different audiences, or to give the audience more choice, rather than compete for regional audience pools.

AFRTS programs are distributed without censorship, propagandizing, or manipulation, in accordance with DOD Directive 5120.20 and DOD Regulation 5120-20R. Program content is unchanged and commercial-free; therefore, all

commercials are replaced with AFN program promotional announcements, DOD internal information, and other public service spot announcements of interest to DOD personnel and their family members.

AFRTS at Present

Although the AFRTS was the largest radio and television service in the world by 1985, the advent of new media has raised issues concerning the role and place of AFRTS within the contemporary experience of DOD personnel abroad. Social and mass media have changed the way DOD personnel communicate and receive information and programming while serving. The news, television shows, and official message services can now be accessed online; however, access is contingent on satellite proximity, bandwidth access, and regional censorship restrictions. Although its goal is not to compete for an audience with main broadcast and entertainment providers, the AFRTS's creation of the Pentagon Channel in 2004 and the launch of the online version in a similar format to that of a popular social media site suggest an effort to remain relevant.

U.S. Air Force Senior Airman Natalie Anderson, of American Forces Network, broadcasts AFN Radio station 94.1 throughout Bagram, Afghanistan, December 21, 2006.

Source: Photo by Staff Sergeant Marcus J. Quartermann.

Despite the nature of mass media and social media, unrestricted access to the aforementioned services cannot be guaranteed to all DOD personnel located in the 177 countries or regions where the United States has deployed. As such, the advent of new forms of communication has not yet precluded the need for the AFRTS and its services abroad. The continued relevance and evolution of the AFRTS will depend on the demand and availability of the services offered in an increasingly individual-based communications era.

Scale of Operation

The AFRTS provides 24-hour access to news, information, and entertainment. To do so, the AFRTS employs personnel from across all branches of military service as well as civilians to meet the technical and content requirements for each aspect of the operation.

Allowing the AFRTS to bring “a slice of home” to service members and their families, two distribution networks enable the operation. A satellite network of six satellites positioned around the globe, in conjunction with the Direct-to-Sailor system of three satellites, provide television feeds. Intelsat Galaxy satellites provide service to the Atlantic and Pacific satellites. Linked Intelsat satellites over the Atlantic provide signals to serving personnel in Africa, the Middle East, as well as Iceland and Portugal. In the Pacific, two satellites carry the AFRTS signal to DOD personnel in Japan and Korea.

Due to the density and proximity of service personnel in Europe, a superstation concept is used to deliver radio and television services across the continent. Eutelsat HotBird satellites are used to disseminate and receive the feed throughout Europe, North Africa, the Middle East, and many parts of Southwest Asia.

All AFRTS satellite transmissions use the Scientific-Atlanta PowerVu® digital compression system, allowing the transmission of multiple channels (television and radio) through a single satellite transponder. This system employs digital conditional access encryption, protecting the feed from being received by unauthorized audiences or “shadow” audiences.

Although exact audience numbers are unclear, the Direct-to-Sailor alone reaches 300 military ships. The intended audience can be assumed as the

number of personnel currently serving in the U.S. armed forces; however, there exists a substantial unintended audience in areas where access is available to non-DOD employees. No official figures exist for the size of the “shadow” audience worldwide, but a study of the audience in Japan found that one fifth of the local population accessed AFRTS radio at least once a week. Similar figures can be assumed in other regions of the world.

ARMED SERVICES COMMITTEE, HOUSE

The House Armed Services Committee is a standing (permanent) committee that serves as the main body dedicated to legislative policy research and Defense as well as Energy agency oversight within the House of Representatives. It is a key component in the larger national defense establishment, including the Department of Defense, national security staff, elements of the Department of Energy, portions of the Department of Homeland Security, as well as military-industrial interest groups. This entry provides an overview of the basic public policy jurisdiction, historical development, and legislative, representative, and oversight activities, as well as organization, key personnel, and related liaison endeavors of the House Armed Services Committee. It is primarily through this committee that the House

influences the setting of American foreign and domestic policies relative to the American military. It does this in conjunction with its sister committee in the Senate, the congressional intelligence committees, and civilian as well as military intelligence agencies, the White House, Pentagon, and relevant components of the larger political parties as well as interest group communities.

Public Policy Jurisdiction

The House Armed Services Committee has jurisdiction over most public policies as reflected in the legislative, representative, and oversight roles of the larger House of Representatives as they pertain to the American national defense establishment. More specifically, this committee looks at issues, develops policies, and investigates the activities common to the defense realm. These activities can include weapons procurements, base resource allocations, governing of the Selective Service System, research and development project promotions/evaluations relative to warfighting, deterrence, as well as military peacekeeping/enforcing missions. Other such activities also under the purview of the House Armed Services Committee include military force deployments, combat and logistical training scenarios, mission assessments, funding authorizations, and disseminations to the various branches of the American military, as well as personnel education, evaluation, housing, rationing, and associate dependent civilian care. At times, policy jurisdiction is shared with various other committees in the House due to the multiple referral phenomena as well as the post-9/11 creation of the Homeland Security Committee. Also, the increased employment of committee/subcommittee task forces and commissions has further decentralized the policy process affecting intercommittee and full House relations.

Historical Development

The House Armed Services Committee was created when two previous committees, the House Military Affairs and House Naval Affairs Committees, were combined in the wake of the Legislative Reorganization Act of 1946 and the creation of the Defense Department in 1949. During the era of militia independence in the 19th century, a separate committee devoted to militia affairs, begun in 1835, was utilized for policy making and oversight in that arena. However, that committee was co-opted by

the Military Affairs Committee as part of a broader attempt to centralize military organization and administration in 1911.

The House Armed Services Committee has often been seen as a “junior partner” in security issues, often overshadowed by its equivalent in the Senate due to that institution’s larger constitutionally specified role in foreign relations. However, it has historically played and still plays a major role in military budgeting. This is particularly true in the coordination of national security goals with local constituent needs as seen in structural policy construction. The major impetus for this high-profile role in budgeting, even relative to the Senate Armed Services Committee, derives from the constitutional grant of origination for revenue bills being vested in the House rather than the Senate.

After the Republican Party gained control of the Congress in the 1994 elections, Speaker Newt Gingrich led a reorganization effort that included changing the name of the House Armed Services Committee to the National Security Committee in an attempt to refocus the committee’s efforts toward more strategic over structural policy formation. When the Democrats regained control over the House after the 2006 midterm elections, they returned the committee’s historic name. Despite a reversal of party control in the wake of the 2010 congressional elections, the Republicans have retained the traditional name of the committee. However, regardless of name, the committee has continued to expand its efforts in strategic policy influence while maintaining its dominance in structural type policy making, especially since the 9/11 terrorist attacks.

Legislative, Representative, and Oversight Roles

The House Armed Services Committee reviews all bills that pertain to its area of jurisdiction in military and naval affairs, and it conducts hearings and engages in markup sessions that write and rewrite legislation, usually after referring it to one or more of its component subcommittees. Then, the full committee votes to report the bill out for consideration by the rest of the chamber, with a committee report that recommends the legislation for passage by discussing its attributes and summarizing its main contours. Most of the members of the House Armed Services Committee come from districts that have strong military or military support constituencies;

thus, part of the representative role of these members is to provide information relevant to them and bring their concerns to the legislative construction process on the committee. Finally, most House oversight involving defense actors occurs in this committee with the prosecution of hearings, commissioning of reports, and conduction of investigations of military and related activities.

Organization/Key Personnel and Liaison Activities

The House Armed Services Committee is organized by the majority and minority parties of the House of Representatives led by a chair and a ranking member, respectively. In 2013 the chair was Howard “Buck” McKeon (R-CA), and the ranking member was Adam Smith (D-WA). The number of members in the committee is set by House Rules and always reflects an overrepresentation of the majority party. The number and jurisdictions of the subcommittees are also set by House Rules and committee desires.

There are seven subcommittees: (1) Readiness, (2) Seapower and Projection Forces, (3) Tactical Air and Land Forces, (4) Oversight and Investigations, (5) Emerging Threats and Capabilities, (6) Strategic Forces, and (7) Military Personnel. The subcommittee chairs are always selected by the majority party, but seniority is the primary determinant of rank within the various subcommittees and the committee as a whole within each party block. The committee and its attendant subcommittees have ongoing relationships with various elements of the national defense establishment, including the military branches, defense contractors, and relevant labor as well as policy interests. In the past, these relationships were seen to be largely elitist in orientation, constituting subgovernments or iron triangles (policy-making relationships between congressional committees, executive agencies, and interest groups); today, they are seen as more pluralistic issue networks composed of shifting coalitions regarding the construction of military and naval policies.

In conclusion, this entry has examined the major policy, historical, political, and structural characteristics of the House Armed Services Committee.

ARMED SERVICES COMMITTEE, SENATE

The Senate Armed Services Committee is the main legislative body responsible for policy construction and oversight relative to the American armed forces. This entry provides a brief overview of the committee’s purpose, organization, historical development, and place within the larger national security community.

Legislative and Oversight Purpose of the Senate Armed Services Committee

The committee’s sphere of public policy includes all legislative and oversight activities that the Senate engages in relative to the American military and its corresponding policies. The committee has primary legislative review of bills and resolutions that deal with military activities and prerogatives such as basing, funding, weapons procurement, strategic and structural policies, personnel recruitment/retention, training, and real-world force deployments, as well as the evaluation, revision, and articulation of military mission parameters, objectives, and overall national security strategies.

The committee plays a prominent role in national security policy construction, with entrenched relations between it and the president, the National Security Council, its sister committee in the House, the Senate and House Foreign Relations/Affairs Committees, the Pentagon, foreign and domestic intelligence agencies, and relevant aspects of the domestic and foreign interest group communities. The committee has primary oversight of the Pentagon and conducts the majority of hearings,

investigations, and associated legislative markup activities on bills/resolutions as well as issues that the Senate deals with relative to the American military establishment. As a corollary to the above activities, the majority of the members of the Senate Armed Services Committee represent state constituencies that have large military/veteran populations, military bases, and military-industrial corporations/businesses as well as associated civilian work forces.

Organization

The Senate Armed Services Committee is led by a chair, Senator Carl Levin (D-MI) in 2013, and a ranking member, Senator James M. Inhofe (R-OK). The committee's membership and subcommittee composition are controlled by both committee rules and larger senatorial rules. As of now, the committee has six subcommittees devoted to several specific areas of defense policy activities: (1) Airland, (2) Emerging Threats and Capabilities, (3) Personnel, (4) Readiness and Management Support, (5) Seapower, and (6) Strategic Forces. The composition of the committee and component subcommittees is always weighted in favor of the majority party; however, this committee has a long history of bipartisanship, though this norm is declining.

Historical Development

The Senate Armed Services Committee was created out of the merging of the Senate Military and Naval Committees due to the Legislative Reorganization Act of 1946. This was part of a larger centralization of military capabilities that established the National Military Establishment, the Central Intelligence Agency, the National Security Council, a separate Department of the Air Force, and the Department of Defense by 1947. Prior to this, the Senate Militia Committee, a by-product of federalism, was merged with the Senate Military Affairs Committee in the wake of the First World War to improve oversight and legislative markup capacities within the Senate.

Due to the Senate's prominent constitutional role in foreign affairs, this committee has always been seen as a power committee within the Senate, unlike its counterpart in the House. Also, the general prominence of all senators relative to representatives as well as the prominence of America's strategic situation in the world order has given this committee a strong voice in the promotion, evaluation, and revision of American military policy since its inception.

For a brief period, the Armed Services Committee declined in prominence with the end of the Cold War; however, the Persian Gulf War and the post-9/11 Afghanistan and Iraq Wars have all contributed to the reemergence of this committee as a power player in senatorial and broader national politics.

Place in the Broader National Security Community

The Senate Armed Services Committee has been seen by theorists to be governed by two competing notions of policy influence and construction. Earlier work claimed that the committee was largely an elitist cabal that created policy in subgovernments with the relevant portions of the defense and military-industrial sectors. However, in the wake of the Vietnam War, these iron triangles (policy-making relationships between congressional committees, executive agencies, and interest groups) were displaced by larger issue networks of shifting coalitions that redefined defense policy making in a more pluralistic manner. The 9/11 attacks have made the committee a decisive place of political action regarding debates over support or opposition to the executive branch's national security agenda. Furthermore, this activity has taken on an increasingly partisan character, fundamentally altering the legislative-executive dynamic in this area of public policy.

Finally, the committee plays a prominent role in the appointment process for commissioning officers in the armed services. This power derives from the constitutional fiat to "give advice and consent" relative to presidential appointments. All officers of the armed forces are tacitly appointees by the president and hence subject to review and confirmation (by a simple majority vote) in the Senate. This is a largely unused authority, defined more by acquiescence to the routines of the commissioning and promotions process. However, it has been employed by the Senate (and the Armed Services Committee in particular) as a way to check presidential power or, at the very least, bring attention to issues of concern. The 1991 Tailhook scandal was one such example of the committee exerting political pressure on the executive branch by holding up promotion confirmation reports to call for a deeper investigation into the sexual assault allegations.

In conclusion, this entry has examined the role that the Senate Armed Services Committee plays in the larger political milieu of American military

affairs. In particular, the entry looked at the committee regarding its authority and composition, historical development, relationship to the rest of the Senate, the political-military-industrial complex, and the executive branch including the presidency.

ARMOR, BODY

The concept of body armor has existed from the dawn of humanity as people developed weapons and sought to defend themselves against their aggressors. As weapons have grown in sophistication, so has body armor. Body armor is a piece of protective equipment worn on or around the torso to prevent damage to a person's vital organs. There are many different types ranging from ancient hoplite (Greek) leather vests and medieval plate armor to modern-day flak jackets and ballistic vests. Armor can be of two varieties, soft or hard. Soft armor consists of multiple layers of protective fabric. Soft armor is generally used by police officers, civilians, and bodyguards. Hard armor consists of a vest with pockets in which the wearer places metal or ceramic plates to increase the level of protection. Hard armor is utilized by military combat personnel and police tactical units. Body armor is an ever-evolving piece of equipment that will continue to change as the nature of weapons is altered. This entry discusses the

development of body armor and describes the types of body armor used by U.S. and other armed forces, with a focus on the U.S. military.

Background

Pre-1941

Though ancient and medieval armies made wide use of body armor, its usage generally ceased with the advent of gunpowder weapons; however, researchers took up its development again in the 1860s. One of the first successful attempts at bullet-resistant armor was developed in Korea following its 6-week engagement with the French during 1866 in response to the increasing firepower of Western armies. The model consisted of a vest made with 13 layers of cotton, the minimum amount determined necessary to stop a bullet.

One of the earliest documented usages of modern body armor occurred during a police shootout in 1880 with the Australian bushranger Ned Kelly. The armor consisted of plough mouldboards that covered his torso, upper arms, and upper legs. Though the armor withstood the projectiles, it could not protect his legs from the wounds that slowed him down and led to his capture. Using his design to develop various models, which were all too heavy to be practical, including the Brewster Body Shield, weighing 40 pounds, developers sought to create more durable armor with better protection while simultaneously making it lighter following World War I.

Post-1941

During World War II, armor development shifted focus from the ground to the air. Great Britain developed the early-model flak jacket for use by the Royal Air Force (RAF). The flak jacket, which weighed 25 pounds, consisted of a vest of ballistic nylon with manganese plates sewn into it and was designed to protect aircraft crew from low-velocity shrapnel fragments caused by the destruction of other planes or the explosion of artillery shells. It was too bulky for RAF pilots in their bombers, so the RAF offered the equipment to the U.S. Army Air Forces, for whom it became a defense standard, and U.S. Navy aircraft carrier personnel.

In 1969, after the failures of the M-1951 and the T65-2 armor models due to their inability to stop bullets, the Barrier Vest was created by American Body Armor. The Barrier Vest mixed the concepts of soft

armor and hard armor by combining quilted nylon with steel plates. In the 1970s, DuPont created a more effective and popular bullet-resistant vest made with a new material named Kevlar. Kevlar armor functions by redirecting the energy of the bullet as it strikes the vest, resulting in the dissipation of force at the point of impact and causing a mushrooming of the projectile. Kevlar armor was flawed in that if high-velocity bullets struck the vest, the energy that was dissipated from the impact point could result in lethal blunt force trauma. As such, further protection has been developed for current use.

Current Armor

The nylon flak jacket was gradually phased out after the invention of the Personnel Armor System for Ground Troops Vest (PASGT-V), which was also designed to reduce shrapnel damage. The new vest, part of an overall protection package called the Personnel Armor System for Ground Troops, that included a new style of helmet as well, was created in the early 1980s and continued to be used up until its phase-out in 2004. The PASGT-V used Kevlar for the first time in a U.S. military vest as opposed to the ballistic nylon. This armor was created with a better fit and weighed anywhere from 7.5 to 11 pounds, depending on the size of the vest. Because of its manner of construction, the PASGT-V offered greater movement, flexibility, and compatibility with other clothing than any previous model.

The PASGT-V can also be upgraded with the Interim Small Arms Protective Overvest, which offers an increase in protection from small arms fire in the front and back of the vest by adding more plate layers to both sides. The Interim Small Arms Protective Overvest can also be used to augment the Ranger Armor Vest and the Combat Integrated Releasable Armor System (CIRAS) vest to improve the wearer's protection from small arms to the back.

Ranger Armor Vests and CIRAS vests were used exclusively by U.S. Special Operations Command troops. CIRAS vests are unique in that they come equipped with a release cable. One pull of this cord releases the vest from the body and makes treatment by medical personnel vastly easier.

From 2004 until today, the PASGT-V has been gradually replaced by the Interceptor model of armor. The Interceptor protects from both shrapnel and ballistic damage more efficiently than the previous

models by making better use of protective plates in conjunction with woven Kevlar and weighing less than previous models. The newest models of armor have two variants, the original Outer Tactical Vest (OTV), used with the small arms protective insert plates, and the Improved Outer Tactical Vest (IOTV), used with the enhanced small arms protective insert plates. The OTV was used from 2004 to 2007, when it was replaced with the IOTV for the U.S. Army. The U.S. Marines adopted the OTV but soon scrapped it and developed a system of armor of their own called the Modular Tactical Vest. Some U.S. Navy ground troops utilize the MTV, while others use the IOTV. All models of the Interceptor include pockets that hold the protective plates that are made of steel, ceramic, or lightweight carbon boride. All modern armor also has the ability to attach groin and neck protection.

Classifications

All armor used in the United States is rated by the National Institute of Justice of the U.S. Department of Justice. The National Institute of Justice has six formal classifications for rating armor: Types I, II-A, II, III-A, III, and IV; higher number types protect from more damaging ammunition and higher velocities. Military-grade armor must have a protection rating of at least III-A, though most have a rating of III.

Future Developments

Currently, researchers are working to continue making the armor as light and effective as possible. One major improvement coming soon is a change to the Interceptor model. Currently, the model uses 20-plus layers of Kevlar, but there are plans to replace the Kevlar with a new M-5 fiber that has a weight about one third of Kevlar.

Looking into the next 5 years, a new fabric is being developed by Dow Corning named Deflexion. The theory behind this silicon-based fabric is that it will be the best of both the soft and the hard armor concepts. The Deflexion armor will be flexible and soft when the wearer is in motion, but on impact, it will harden to a near-solid state providing maximum protection. The secret of this fabric lies in its molecular structure. The molecules move around freely under normal conditions, but on impact, they become compressed and spread the impact across the surface of the armor.

Another innovation that could potentially be coming to body armor stems from the inspiration given by a deep-sea mollusk. The mollusk has a shell consisting of three layers. The first layer is made of iron sulphide particles. The second layer is spongy. The third layer is a general layer of protection. Translated into armor, this would result in a three-layer model, where the first layer would form tiny cracks on impact so as to prevent more extensive damage to the rest of the suit, the second layer would absorb the majority of the impact, and the third layer would provide the remainder of the needed protection.

ARMORED VEHICLES

In broad terms, armored vehicles provide protection for their occupants and vital systems while transporting them on the battlefield. While many aircraft and watercraft incorporate armor, in the modern military lexicon, *armored vehicles* generally refers to ground combat and support vehicles. Armor is not an end in itself but provides protection to increase a vehicle's survivability for it to fulfill a purpose. Armies since World War I have employed armored vehicles in a variety of roles including, but not limited to, transporting infantry, security operations, command and control, air defense, chemical warfare, artillery support, reconnaissance, medical evacuation, and recovery operations. Many law enforcement and paramilitary organizations also use armored vehicles. Armored vehicles range in size and weight from the main battle tank to armored trucks. However, the term *tank* generally refers to a specific category of vehicles and often leads to

assessments of a military's strength in terms of tanks *and* armored vehicles. Therefore, this entry focuses on vehicles other than tanks.

Historical Background

Designs of armored vehicles correspond with their purpose in a given threat environment. Armor and propulsion are not ends in themselves but a means of protecting mechanical, electronic, and human systems and facilitating their effects on the battlefield. Additionally, armored vehicle design and capabilities should correspond to an army's tactical doctrine. One of the most important functions armored vehicles perform is the movement and protection of dismounted infantry. As warfare became increasingly mechanized in the second half of the 20th century, the need to support rapidly moving armored units spurred the development of armored infantry carriers, a departure from the armored cars introduced in the pre-World War I era. During World War II, Allied and Axis armies employed infantry carriers combining wheels and continuous track systems, called half-tracks. These vehicles featured open transport bays that offered poor protection for the infantry. The postwar period saw the emergence of the armored personnel carrier (APC), such as the American M113 series, designed to move the infantry into the battle area protected against the effects of small arms and artillery. The M113 and similar armored vehicles were "battle taxis," meant to bring the infantry close to the battle, where they dismounted and fought on foot.

The Soviet Union changed the nature of infantry transport in 1970 when it began producing the Boyevaya Mashina Pekhoty (BMP), the world's first infantry fighting vehicle (IFV). Unlike armored personnel carriers, the IFV incorporates specific design features that allow the infantry to remain in and fight from the vehicle or dismount and fight on foot. The United States produced the M2/M3 Bradley fighting vehicle in response to the Soviet's BMP program. Both IFVs had ports through which the infantry could fire and offered increased protection against nuclear, biological, and chemical weapons. Most IFVs mount powerful weapon systems with an offensive capability, in contrast to the medium- and heavy-machine guns commonly found on armored personnel carriers. The development of antitank missiles in the 1960s provided a lightweight,

tank-killing weapon that U.S. and Soviet designers quickly married to their respective IFV platforms. These vehicles comported to Soviet and American doctrine that called for close coordination between tanks and supporting infantry.

A single armored platform often supports vehicle variants meant to fulfill a number of battlefield roles. For example, the M113 family of armored vehicles provided a number of variants, including command and control, antitank missile, medical evacuation, engineer, and fire support vehicles. Variants of the Bradley IFV have included a Stinger missile air defense variant, a combat engineer variant, reconnaissance variant, and fire support variant. The purpose of these vehicles is to protect these systems in a combat environment.

Armored vehicles operate most effectively in environments that facilitate their mobility and allow their weapon systems space for long-range targeting. In environments where vehicles must remain on established roads, they become vulnerable to ambush, mines, and improvised explosive devices (IEDs). In the 1980s, the Afghan mujahideen effectively targeted the Soviet Union's armored vehicles in regions of Afghanistan where that country's severely mountainous terrain restricted vehicle movement to narrow, poorly constructed roads. Similarly, during the Vietnam War, the Viet Cong mined the roads of Vietnam and ambushed U.S. armored vehicles that could not venture into the swamps and jungle. Urban environments offer perhaps the most dangerous environment for armored vehicles. Multistory buildings give enemy antitank teams vantage points from which to employ close-range antitank weapons against vehicles' thinly armored top decks and turrets. Snipers and hidden machine guns force vehicle crews to button up, limiting their visibility and ability to engage dismounted threats. Cities with underground sewer systems permit the placement of explosives underneath armored vehicles, the least protected area for those platforms lacking mine-resistant, v-shaped hulls and high ground clearances. The Russian army's experience fighting in Grozny in the late 1990s demonstrated the vulnerability of armor, unsupported by dismounted infantry, in an urban battlefield.

Characteristics and Roles

The purpose that the vehicle serves dictates its characteristics, which one can describe in terms of mobility,

firepower, and survivability. *Mobility* refers to the ability to traverse various types of terrain, often without the benefit of well-established road networks. Heavy woodlands, marshes, jungles, and mountains all present significant mobility challenges to all forms of armored vehicles. The key to cross-country mobility is the distribution of weight across the greatest possible surface area. Vehicle propulsion systems consisting of continuous tracks or "caterpillar" tracks have proven very effective at providing cross-country mobility, allowing for heavy-armor and -weapon systems. Because tracked armored vehicles require significant logistical infrastructure for support and maintenance, they are less cost-effective for paramilitary organizations and militaries with limited budgets. Tracks also tend to destroy vegetation and tear up roads. These tendencies, combined with their intimidating size, often make tracked armored vehicles less than ideal for security and assistance operations requiring close relationships with the local population.

When mission requirements dictate that forces primarily travel on established roads or when forces wish to maintain a less imposing presence, wheeled armored vehicles offer an alternative. Wheeled vehicles distribute the vehicle's weight across four to eight tires, which make them less effective at cross-country travel but also less destructive of road networks. Less weight means not only less armored protection and firepower but also fewer logistical requirements. For example, to idle for 8 hours, the American M1A2 Abrams main battle tank requires 300 gallons of diesel, while an M1126 Stryker Infantry Carrier Vehicles will not exhaust its 55 gallon fuel tanks. Wheeled vehicles also offer a less imposing image to local populations, making them better suited for use in operations other than high-intensity maneuver war.

In addition to tactical mobility, different types of armored vehicles possess differing levels of operational and strategic mobility. Operational mobility is the ability to move within a theater of conflict. Moving tracked armored vehicles several hundred miles within a theater without causing significant wear on their tracks and engines requires heavy equipment trailers. Conversely, wheeled armored vehicles can move rapidly within a combat theater under their own propulsion without any significant maintenance requirements. Strategically, wheeled armored vehicles can travel into a combat zone as cargo on heavy lift aircraft more efficiently than

heavy tracked vehicles. As a matter of practice, however, deploying large numbers of wheeled or tracked armored vehicles requires sealift capabilities and extensive port infrastructure.

Armored vehicles possess various levels of firepower depending on their purpose. *Firepower* describes the weapon systems a vehicle possesses, although one could also include, where appropriate, the firepower of the infantry soldiers a vehicle carries into battle. Vehicles designed to carry infantry and to engage in direct-fire combat such as the Russian BMP series and the American M2/M3 Bradley fighting vehicle have weapon systems capable of defeating other armored vehicles and even tanks. In contrast, armored vehicles such as the mine-resistant ambush-protected vehicles' series, which the United States purchased for counterinsurgency operations in Iraq and Afghanistan, mount medium- or heavy-machine guns primarily for close protection of the vehicle. While mine-resistant ambush-protected vehicles often engage in direct-fire combat, they are not designed to encounter other armored vehicles and, therefore, require less firepower. Armored, self-propelled artillery possesses extremely powerful weapons, but to provide indirect fire support, not to engage other armored vehicles. Recovery, fire support, and command and control vehicles also possess limited firepower.

The thickness and design of a vehicle's armor determine the level of protection the vehicle offers to its crew and internal systems. The term *survivability* refers to the combination of all systems that protect the vehicle and crew from enemy weapons. Fire suppression systems, compartmentalization, reactive armor, and the location of ammunition and fuel tanks all affect vehicle survivability. Battlefield threats include direct-fire weapon systems, artillery, air attack, mines and other buried explosive devices, and vehicle obstacles. Here again, the vehicle's purpose dictates the level of protection, generally characterized by the vehicle's capability to withstand damage from battlefield threats. Armored vehicles characterized as "heavy" armored vehicles can withstand significant damage from all but the most powerful antitank systems. That protection comes at the cost of increased weight from armor and tracked propulsion systems. "Medium" armored vehicle carry enough armor to prevent artillery shrapnel and heavy-machine gun rounds from penetrating the vehicle, but antitank systems are often too powerful

for these vehicles. For this reason, the United States upgraded its Stryker vehicles with "slat" armor to defeat rocket-propelled grenades before deploying those systems to Iraq. Most small-caliber weapons cannot penetrate "light" armored vehicles, but most heavy weapons can defeat their armor. There is no such thing as impenetrable armor; for example, armor-piercing ammunition may allow heavy machine guns and large-caliber sniper rifles to penetrate medium- and even heavy-armored vehicles.

Armies and paramilitary organizations faced with few threats from antitank weapons or armored vehicles, but with many threats from mines and improvised explosives, require vehicles with unique armor profiles. This was especially true when circumstances dictated that the U.S. military execute counterinsurgency operations in Afghanistan and Iraq, where insurgents quickly adopted the improvised explosive device as their weapon of choice. The U.S. armor vehicle fleet was, up to 2003, optimized for maneuver warfare against similarly armed enemies, so a heavy emphasis went to maintaining large fleets of tanks and heavy armored vehicles. Counterinsurgency operations required large numbers of vehicles to patrol the streets of Baghdad and roads of Afghanistan. After initial attempts to increase the survivability of unarmored vehicles proved ineffective, the American military deployed vehicles designed specifically to defeat the improvised explosive device threat. These vehicles had long been present in the inventories of nations dealing with low-intensity security threats. South Africa's security forces developed similar vehicles during the last decades of the 20th century to defeat similar threats.

Conclusion

For almost a century, armored vehicles have operated on almost all the world's battlefields, as a means to increase the mobility, survivability, and lethality of soldiers and systems. Specially designed versions have demonstrated their worth in peacekeeping, peace enforcement, internal security, and counterinsurgency operations. Vehicles operating in environments for which their developers intended them have, in general, been very effective. When armies mismatched vehicles to the environment and mission, the results have often been devastating. However, armored vehicles, despite their cost and

logistical demands, will likely remain present in the inventories of the world's armies for the foreseeable future.

ARMS, SMALL

Small arms comprise weapons designed to be carried by individual personnel into combat—most notably service rifles, sidearms, and specialized weapons. These weapons utilize the concept of direct fire, that is, an uninterrupted line of sight through which to engage a target. Their main role is to neutralize enemy infantry units in medium- to close-range combat. Each type of weapon has specific attributes that make it best for a distinct situation. This entry describes the types and features of small arms used by the U.S. military.

Service Rifles

Modern service rifles are known as assault rifles, meaning they combine the power of a traditional single-shot rifle with a faster rate of fire and high-capacity ammunition magazines. This makes them

multipurpose weapons capable of performing a variety of soldierly tasks. The primary service rifle of the U.S. military is the M16 assault rifle—a lightweight, 5.56-milimeter, gas-operated, air-cooled, magazine-fed assault rifle with a rotating bolt actuated by direct impingement gas operation and capable of semiautomatic and full automatic fire. Developed in the 1960s, it was first used in combat in Vietnam. Since adoption by the U.S. military, it has undergone four model changes, each designed to make specific improvements to the weapon. The most recent version, the M16A4, has many improvements that make it superior to the original model. It boasts improved iron sights, a larger capacity magazine, and an especially ingenious forward assist button. The forward assist button was added to prevent the possibility that the weapon would jam and be unable to fire.

Another unique feature of the M16 is the possibility for customization of the weapon. Although it is ready to use as is, the M16 has two key features that allow it to be modified to suit the operator. First, the carrying handle can be removed so that the iron sights can be replaced by more modern optics. The realities of modern-day combat require that virtually every infantry soldier upgrade either to a rifle scope or close combat optic, often abbreviated to CCO. These advanced optics allow the user to acquire a target faster than when using the traditional iron sights. Second, the stock of the M16 is detachable, allowing the attachment of two different stock options: adjustable and fixed. An adjustable stock allows the total weapon length to be decreased, particularly important in urban environments. Along with its accuracy and affordability, the ability to modify the M16 has made it the longest continuous service rifle in U.S. military history.

To complement the M16, the U.S. military has also approved a more compact version of its standard service rifle, the M4 carbine. The M4 is fundamentally a smaller copy of the M16 and has similar capabilities. It fires the same size bullet (5.56 NATO), uses the same magazine, and contains a number of the same replaceable parts. Because of its size, it is favored in military operations in urban terrain, also known as MOUT.

Another addition to the M16's capabilities is the M203 40-mm grenade launcher. Designed to be attached beneath the barrel of an M16/M4, the M203 was implemented to add firepower to a

service rifle platform, allowing soldiers to engage fortified defensive positions and lightly armored vehicles. The grenade launcher can fire an assortment of ammunition types, including high explosives, smoke, flares, and buckshot pellets.

Sidearms

The term *sidearm* normally refers to a pistol that a soldier carries in the event of a service rifle failure or when all available rifle ammunition has been depleted. Not every soldier is expected to carry or is even issued a sidearm. Sidearms are primarily supplied to noncommissioned officers, commissioned officers, or those not usually issued a service rifle—pilots or military police officers in a noncombat deployment. The longest serving sidearm in U.S. military history was the Model 1911A1 .45, mainly due to its reliability and incredible power. Serving since the First World War, it was replaced in 1990 by the M9 9-mm, the current sidearm of the majority of the U.S. military. The M9, although it fires a smaller size round, has a 15-round magazine (compared with between 7 and 9 rounds for the 1911A1) and is considerably more accurate than its predecessor.

Specialized Weapons

Specialized weapons are carried by soldiers whose roles differ from those of an ordinary infantry soldier. There are two main types of small arms that are considered specialized weapons: sniper rifles and shotguns. Sniper rifles, as the name implies, are issued to snipers, who are expert military sharpshooters. With the capability to engage targets at extremely long ranges, the sniper rifle allows the soldier to eliminate enemy soldiers with precise accuracy and surprise. Each military branch employs a number of different rifle types depending on the combat situation expected.

Despite the diverse number of sniper rifles, most have similar operating systems and features. The main sniper rifles used by the U.S. military, such as the M24 or M40, are bolt-action rifles. This means that after each shot the bolt must be manually pulled back, the spent shell ejected, and a new shell pushed into the barrel. This process makes the weapon more accurate and more consistent but produces a very slow rate of fire. Sniper rifles are also fitted with a long-range rifle scope. The scope gives the operator the ability to see and engage targets at distances far

greater than the human eye can see. This gives the operator a great advantage over conventional enemy infantry.

Shotguns are designed to be used in extremely close combat. Shotguns have an advantage in urban combat because of their power and ability to spread shot projectiles instead of firing a single bullet. Their main disadvantage is that they are not effective beyond close ranges. Like sniper rifles, there is no single model type used by every branch of service. However, the most popular type is the 12-gauge pump shotgun; pump meaning it is manually reloaded after each round.

These varieties of small arms make up the modern arsenal for the U.S. military. Modern technology dictates that new weapons may soon replace existing weapons with more futuristic models. Contemporary designs are seeking to improve on small arms by adding high-tech equipment such as infrared cameras, night vision, and advanced weaponry into one, all-purpose service rifle. Until then, the small arms of today will bear the standard for the modern U.S. military.

ARMY, DEPARTMENT OF

Founded in 1789 as the Department of War, the Department of the Army (DA) was reorganized as a service department under the National Security Act of 1947 and charged with the administrative affairs of the U.S. Army. Composed of the Office of the Secretary of the Army, the Office of the Army Chief of Staff, the Army Staff (ARSTAFF), and support agencies, DA is responsible for recruiting; organizing; supplying; equipping; training; servicing; mobilizing; demobilizing; administering; constructing and

repairing military equipment, buildings, structures, and utilities; and acquisition of real property necessary to support the army. This entry describes the mission, function, and organization of the DA.

Mission and Function

The army's statutory obligations are summarized in Article 1, Section 8 of the Constitution of the United States as executing the laws of the Union, suppressing insurrections, and repelling invasions. Expanding those roles, Chapter 307 of Title 10 of the United States Code (10 USC) establishes that the army will be organized, trained, and equipped primarily for land combat operations to preserve peace and security; provide for the defense of the United States, the Commonwealths and possessions, and any areas occupied by the United States; support national policies; implement national objectives; and overcome nations responsible for aggressive acts that imperil the peace and security of the United States. Chapter 303 of 10 USC establishes that through authorities residing with the secretary of defense, and subsequently the secretary of the army, DA will administer the army to execute its constitutional obligations.

Department of Defense Directive 5100.1, *Functions of the Department of Defense and Its Major Components*, codifies the roles, responsibilities, and authorities of DA according to existing law as prescribed in 10 USC. Department of Defense Directive 5100.1 stipulates both common departmental and service-specific functions that DA carries out. Common functions include the following: recruiting; organizing; supplying; equipping (including research and development); training; servicing; mobilizing; demobilizing; administering (including the morale and welfare of personnel); maintenance, construction, outfitting, and repairs of military equipment; construction, maintenance, and repair of buildings, structures, and utilities; and the acquisition, management and disposal, and management of real property and natural resources in support of each service.

Through the authority of the secretary of defense, the secretaries of the military departments are also responsible for the operation and efficiency of their departments; formulation of policies and programs that are fully consistent with national security objectives and policies established by the president and the secretary of defense; effective and timely

implementation of policy, program, and budget decisions and instructions of the president or secretary of defense relating to the functions of each military department; carrying out the functions of the military departments so as to fulfill the current and future operational requirements of the Combatant Commands; effective cooperation and coordination between the military departments and agencies of the Department of Defense (DOD) to provide for more effective, efficient, and economical administration and to eliminate duplication; presentation and justification of the positions of their respective departments on the plans, programs, and policies of the DOD; the effective supervision and control of military department intelligence activities; and other activities prescribed by law or by the president or secretary of defense.

As a military service, the army has functions that are common to the navy, air force, and Marine Corps. The secretary of the army is responsible for the following service-related functions: determine force requirements to support the national security strategy and requirements of the Combatant Commands; recommend the assignment and deployment of forces to the Combatant Commands and to the Joint Chiefs of Staff; administer service forces; provide logistics support to service forces; develop doctrine; conduct testing and evaluation; provide joint training and exercises; operate organic vehicles; and participate in the development of doctrines, training, and equipment for joint operations.

As the distinct land component of the DOD, DA is responsible for the preparation of land forces necessary for the effective prosecution of war and other military operations. The primary function of the army is the organization, training, and equipping of land forces to defeat enemy land forces and seize, occupy, and defend land areas. Furthermore, the army is responsible for organization, training, equipping, and providing joint forces for air and missile defense, space operations, amphibious operations, airborne operations, special operations, psychological operations, and, more recently, cyberspace operations.

Organization

DA is composed of the Office of the Secretary of the Army (the secretariat), the Office of the Army Chief of Staff, the ARSTAFF, and various support

agencies. Within the Office of the Secretary of the Army are the offices of the secretary, the under secretary, the assistant secretaries, the general counsel, the administrative assistant, the chief information officer, the inspector general, the auditor general, the chief of legislative liaison, the chief of public affairs, the director of small business programs, and the deputy under secretaries. The secretariat is responsible for army-wide policy development, promulgation, and oversight of their assigned functional areas. As such, the secretariat advises the secretary of defense on army capabilities and requirements to perform its statutory missions; presenting and justifying army policies, plans, programs, and budgets; communicating army policies, plans, programs, capabilities, and accomplishments to the public; and managing the external affairs and the compliance functions of the army with the advice and assistance of the chief of staff of the army (CSA).

The CSA serves as the senior military advisor to the secretary of the army in all matters and has responsibility for the effective and efficient functioning of army organizations and commands in performing their statutory missions. Among the responsibilities of the CSA are serving as the senior military leader of the army; assisting the secretary of the army in the external affairs, including presenting and justifying army policies, plans, programs, and budgets; presiding over the ARSTAFF to ensure the effective and efficient function of the headquarters; serving as a member of the Joint Chiefs of Staff in providing independent military advice to the secretary of defense, president, and Congress; and representing army capabilities, requirements, policy, plans, and programs in Joint forums.

The integration and coordination of DA policy, position, and procedures across functional areas of responsibility are conducted by the ARSTAFF. The ARSTAFF comprises five deputy chiefs of staff (G-1, Personnel; G-2, Intelligence; G-3/5/7, Operations, Plans, and Training; G-4, Logistics; G-8, Resource Management); the chief of engineers; the surgeon general; the chief, National Guard Bureau; the chief, Army Reserve; the judge advocate general; the chief of chaplains; and the sergeant major of the army.

ARMY, U.S.

In 2012, the U.S. Army had just concluded one major conflict the previous year (Iraq), remained engaged in another conflict (Afghanistan), and still maintained a significant presence on the Korean peninsula. The Army's active-duty strength was approximately 550,000, which was organized into three field armies (Third, Seventh, and Eighth), four corps (I, III, V, and XVIII Airborne), and 10 divisions (1st Armored, 1st Cavalry, 1st–4th and 25th Infantry, 10th Mountain, and 82nd and 101st Airborne). Numerous separate brigades, groups, regiments, and even separate battalions also existed in the combat, support, and service branches. A small number of U.S. Army forces were also permanently attached to the U.S. Special Operations Command, a joint organization that controlled the most important elite units within all of the services, including the U.S. Army Special Forces (Green Berets), U.S. Army Rangers, Air Force Special Operations Command, and U.S. Navy SEALs.

In the early 21st century, the U.S. Army was undergoing a major reorganization that was itself begun in the late 1990s as Force XXI. Force XXI was an effort to restructure army divisions to take advantage of new technology and allow smaller formations to control a larger battle space. Ultimately, Force XXI had a major role in the organization of modular brigades and the brigade combat team concept found in the army during Operations Enduring Freedom and Iraqi Freedom. Organizational change has been a common theme in the history of the army. From the American Revolution to the Global War

on Terrorism, the army has adapted to whatever environment it found itself in, all but one of those times successfully. This entry discusses the history of the U.S. Army, including its organization, the use of conscription, downsizing and other challenges, and the army's role today.

Early History

Organized around the militias of the 13 original British colonies, the Continental Army (as the U.S. Army was originally called) of the American Revolution only became a professional force over time. The militia that first reported for duty under the command of Major General George Washington in 1775 had little or no formal military training. A few more senior officers, like Washington, had combat experience in the French and Indian War (1754–1763), but the majority of the militia had no experience other than some minor skirmishes with Native Americans. Over time, the experience of combat and the training offered by some European volunteers (most particularly Major General Friedrich von Steuben) turned the militia into professionals.

Unfortunately, after the American Revolution, the U.S. Army was all but eliminated by Congress. At its low point, the entire army consisted of a single artillery battery located at West Point, New York. The defeat of a militia force in the Northwest Territory (modern-day Ohio, Illinois, Indiana, and Michigan) by Native Americans in 1791 led to the formation of the Legion of the United States, the first postrevolution reincarnation of the professional army. The legion, which contained a mix of infantry, cavalry, and artillery, continued only until 1796, when a more traditional regimental structure was created. The War of 1812 caused a large increase in the size of the army and provided another opportunity to demonstrate the benefit of professionally trained soldiers over ill-trained militia soldiers. The majority of soldiers during the War of 1812 were members of U.S. Volunteers, who formed regiments designated only for wartime service. This system of using predominantly volunteer formations during wartime continued until the National Defense Act of 1916, which reorganized the army between the Regular Army, National Guard, and National Army. The National Army included the Regular Army and National Guard, as well as volunteers and draftees designated for service during wartime only.

In the period from the War of 1812 to the Mexican-American War, the U.S. Army remained small and underfunded. The outbreak of the Mexican-American War in 1846 led to yet another temporary expansion in the size of the army. Greatly outnumbered and having to rely on substantial numbers of militia, European observers did not expect the U.S. Army to defeat the European-organized and -trained Mexican Army. Nevertheless, the United States succeeded with an army led by officers who were long-serving professionals and frequently graduates of the United States Military Academy (founded in 1802). The extensive combat experience gained by these officers proved important when the United States was torn by civil war less than two decades later.

The Civil War to 1917

The secession of South Carolina and the subsequent attack on Fort Sumter in Charleston Harbor in April 1861 marked the beginning of the American Civil War. Since this conflict was internecine, the combat experiences gained during the Mexican-American War did not benefit only the U.S. Army. For instance, both Confederate President Jefferson Davis and Confederate general-in-chief Robert E. Lee were graduates of the United States Military Academy and combat veterans of the Mexican-American War. The Civil War saw the first widespread use of African Americans in the armed forces, and approximately 190,000 African Americans served by the end of the conflict. By the end of the Civil War in 1865, the U.S. Army was ranked among the most powerful military forces in the world. However, the U.S. Congress again reduced the size of the army to nothing more than a constabulary strong enough to patrol the Western frontier and battle Native Americans.

During the post-Civil War period, the U.S. Army resumed a constabulary role, which had occupied the majority of its time during the 19th century. While the U.S. Colored Troops, formed during the Civil War with African American volunteers, were demobilized following the war, four Regular Army regiments (9th and 10th Cavalry and 24th and 25th Infantry Regiments) were organized largely from Civil War veterans. From 1865 to 1877, the army was the enforcing arm of Reconstruction in the former Confederate states. While admirably performing

its role in Reconstruction, the overall policy failed largely due to congressional parsimony and a lack of political will on the part of Northerners. During the 1870s and 1890s, the army was torn between frontier policing against Native Americans, on the one hand, and involvement in labor disputes during the uglier phases of the American Industrial Revolution, on the other.

Not until the Spanish-American War in 1898 did the U.S. Army again increase in size. The short duration of the war—less than 4 months—meant that very little actual combat experience was gained by the soldiers. However, the end of the war found the United States with new territorial possessions throughout the globe that now needed to be administered and, in some cases, pacified, which required an increase in the size of the regular army. As a colonial power, the United States was not only involved in Puerto Rico, Guam, and the Philippines but also participated in the Western Expedition to relieve the besieged Peking legations during the Boxer Rebellion in China in 1900.

While the rest of the world was engulfed in World War I, the U.S. Army found itself involved in Mexico. On March 9, 1916, the Mexican revolutionary Francisco “Pancho” Villa raided Columbus, New Mexico, and killed 17 American soldiers from the 13th Cavalry Regiment. In response, U.S. president Woodrow Wilson ordered Brigadier General John J. Pershing into Mexico to find and capture Villa and his men. The Punitive Expedition was significant both for being the last horse-mounted campaign in American history and for being the first U.S. Army campaign to use mechanical vehicles. The Punitive Expedition dragged on for almost a year of hard campaigning with numerous chases and small skirmishes, but since Villa was never captured, it was deemed a failure.

The Punitive Expedition ended in February 1917, and the United States entered World War I just 2 months later, in April. By the time the United States declared war on the Central Powers, the war was almost 3 years old, and the conflict had taken on a rather distinct character. Trench warfare, poison gas, and massive artillery bombardments created a horrific situation for the soldiers, and the end of the war resulted in a worldwide antiwar movement that manifested itself in the United States as an isolationist attitude toward the rest of the world. For the first time in American history, the United States used conscription

from the beginning of its participation in World War I. While conscription had been used during the Civil War, it showed some level of desperation on the part of both the Union and the Confederate governments, since, historically, enough men had always volunteered for military service in times of war. The need to force military service through conscription became a standard facet of 20th-century American warfare and had negative side effects during the Vietnam War.

The Interwar Years and World War II

On June 2, 1920, less than 2 years after the end of World War I, the U.S. Congress passed the National Defense Act, which defined the organization of the U.S. military during the interwar period. Rather than creating a new and more powerful peacetime U.S. Army, the act returned the army to the status quo ante, chronically underfunded and only large enough to serve as a skeleton for future wartime buildups. The act officially established three new branches of the U.S. Army (Air Corps, Chemical Warfare Corps, and Finance Corps), while at the same time abolishing one wartime branch (Tank Corps). Unfortunately, the act did not reflect a change in national military policy, but rather it was a continuation of the *de facto* standing policy since the American Revolution. Historically, Americans were hostile to any large standing army regardless of changed geopolitical circumstances or the consequences on the state of military preparedness or national defense.

The National Defense Act of 1920 created a two-decade-long bleak period for the U.S. Army. During the 1920s and 1930s, the army had little money for training—let alone technological development. The U.S. Congress justified the drastic reduction in size of the army by pointing out that frontier constabulary duty in the American West and colonial possessions had ended. Without money for a large or high-tech force, the army turned inward and came to value education and training. While the army never adopted a true German-style general staff system, institutions such as the Command and General Staff School at Fort Leavenworth, Kansas, represented an effort to institutionalize professionalism in the officer corps. The Army War College, then located in Washington, D.C., took things a step further and involved students in military planning for the War Department.

The invasion of Poland by Nazi Germany on September 1, 1939, found the U.S. Army as the 18th largest army in the world, behind nations such as Greece, Poland, Portugal, and Turkey. After the German conquest of France in 1940, the U.S. Congress finally procured the funds necessary to modernize the army. Nevertheless, the December 7, 1941, attack on Pearl Harbor still found American soldiers equipped with World War I-era weapons and equipment. The final surrender of American and Filipino forces in the Philippines in May 1942 has often been attributed to the benign neglect of the army during the interwar period.

During World War II, the U.S. Army found itself fighting both on the islands of the Pacific and the continents of Africa and Europe. In the Pacific, the infantry performed almost all of the ground operations conducted by the army. In Europe, traditional infantry units were joined by the newly formed Armored Force, which encompassed not only tanks but also mechanized infantry and mechanized field artillery. At its high point in World War II, the army encompassed three army groups (6th, 12th, and 15th), 11 field armies (1st–10th and 15th), 24 corps (1st–16th, 18th–24th, and 36th), and 95 divisions (1st–14th, 16th, and 20th Armored; 1st and 2nd Cavalry; 1st–13th, 17th, 24th–38th, 40th–45th, 63rd, 65th, 66th, 69th–104th, 106th Infantry, Americal, and Philippine). By the end of the war, the army was a profoundly changed institution. The size of the army set the standard by which the organization has measured itself ever since. In addition, the gasoline engine had, once and for all time, changed the definition of horsepower. During World War II, women were finally accepted into the military and within the army both as nurses and as members of the Women's Army Corps, freeing men for the front by performing state-side administration and maintenance tasks. While the Women's Army Corps was intended only as a war-time temporary measure, it became a permanent part of the army via congressional legislation.

The Cold War

After another drastic downsizing, the U.S. Army was confronted with a dismemberment when the U.S. Air Force became a separate military service in 1947. The decision to create an independent air force had two major consequences for the army. First, the air force was the largest single recipient

of funds in the Department of Defense from 1947 to 1960, which meant that the budgets of the other three services were frozen or reduced. Second, the army now found itself without dedicated close air support, which led to the development of rotary-wing army aviation (helicopters), which played an important role in the Vietnam War.

Following a short interlude of occupation duty in Germany and Japan, the outbreak of the Korean War in 1950 caused a temporary increase in the size of the U.S. Army. The Korean War was fought almost exclusively with World War II weapons, equipment, and tactics and frequently with the previous war's veterans. The remainder of the 1950s saw the army marginalized on the nuclear battlefield and attempting to reorganize. To remain relevant, the army created the Reorganization of the Current Infantry Division, most commonly referred to as the Pentomic division. This new division structure was organized around five infantry battalion-plus sized battle groups rather than the more traditional three infantry regiments.

The early 1960s found the U.S. Army again reorganizing for conventional warfare with the Reorganization of Army Divisions structure. This new division organization returned to the triangular organization of World War II, but with three combat brigades rather than with three combat regiments. This divisional organization was used by the army during the Vietnam War. This war proved to be the most divisive conflict in American history other than the Civil War. While the army was able to boast that it never lost a battle in Vietnam, the American people and their representatives decided to end the war—leaving South Vietnam vulnerable to conquest from North Vietnam, which occurred in 1975. While the army exhibited genuine innovation, principally in the form of air mobility doctrine, the unconventional nature of the conflict proved too difficult to conclusively defeat before the American people ran out of patience. Conscription, which had been used successfully during the World Wars and the Korean War, became a major factor in the decision to withdraw American troops.

In the aftermath of the Vietnam War, the U.S. Army was torn by racial strife and a serious drug abuse problem. One of the first changes was the abolition of conscription and the return to the volunteer military, which was the norm in American history prior to World War I. In addition, it took the efforts of a dedicated group of officers in the period

from 1973 to 1990 to transform the army back into the world's leading military force. Not only individuals and new doctrine but also new weapons systems helped bring about this transformation. The arrival of the M1 Abrams tank and the M2/M3 Bradley fighting vehicle provided the army with the best tanks and mechanized infantry vehicles in the world.

The Post-Cold War Era

Ultimately, the final proving ground for this reformed U.S. Army was not the combat with the Soviet Union in the Fulda Gap between East and West Germany. Instead, the army tested itself in the deserts of Kuwait and Iraq. Following the invasion of Kuwait by Iraqi dictator Saddam Hussein in 1990, the United States committed military force to liberate Kuwait in Operation Desert Storm, or the Persian Gulf War as it is more commonly known. The liberation of Kuwait began in January 1991 with an air campaign that lasted for 1 month before the ground campaign began on February 24. While the United States did not represent the only combat force of the 34-nation coalition, it did provide almost 75% of the strength.

The ground combat phase of Operation Desert Storm lasted a mere 100 hours and was a case of overwhelming technological superiority on the part of the U.S. Army and its allies against the Iraqi Army. The war played to the strengths of the U.S. Army and involved large, armor-heavy forces on both sides. Also, the M1 Abrams and M2/M3 Bradley were even more effective than anyone had anticipated. Only 149 Americans were killed in action, while approximately 25,000 Iraqis were killed. Ironically, though the location was different, the type of warfare was exactly what the army had been training for since the end of World War II.

From Operation Desert Storm through the opening phase of Operation Iraqi Freedom, the U.S. Army's armored and mechanized forces dominated the conventional battlefield. Operation Desert Storm was such a resounding and quick victory that most Americans, even many in the Department of Defense, believed that the army was virtually unbeatable. This attitude led to complacency during the 1990s, which allowed for a drastic downsizing in the army. For instance, the active-duty army was reduced from 18 divisions (1st–3rd Armored; 1st Cavalry; 1st–9th, 24th, and 25th Infantry; 10th

Mountain; and 82nd and 101st Airborne) in 1989 to 10 divisions by 1995. In addition, it led to the cancellation of several weapons systems that were seen as unnecessary but that the armed forces believed were indeed necessary if America was to maintain a technological advantage over the rest of the world.

Despite the cuts to the U.S. Army and the rest of the armed forces during the 1990s, the post-Cold War world presented many challenges for the United States. Even in the 1990s, the U.S. military's conventional dominance was challenged long before combat in Afghanistan and Iraq. The most important and perhaps prophetic of these challenges to American conventional military power was the Battle of Mogadishu in 1993 (commonly known as Black Hawk Down from the book and movie of the same name) in Somalia. The conflict in Somalia represented an effort by the United States to impose order on a failed state. Though only 18 Americans lost their lives versus as many as 2,000 Somalis, it was the United States that left Somalia without completing its goals. This confrontation between a Western power with technological superiority and Muslim unconventional warriors who fought against Western culture/influences became a theme of the early 21st century.

Global War on Terrorism

The Global War on Terrorism (later simply the War on Terrorism), which began after the September 11, 2001, attacks on New York and Washington, D.C., included further combat situations in which firepower was matched by the terrorists' use of unconventional warfare and a willingness to incur heavy losses—most particularly through suicide bombing. During the conflict, the U.S. Army was forced to continue to be technologically and tactically innovative in order to confront the new threat. However, American defense policy also had to undergo many profound changes to meet the unconventional nature of the war.

The Taliban's involvement in the September 11 attacks led to the initial campaign to topple the Taliban as the de facto rulers of Afghanistan. This campaign found U.S. Army Special Forces, along with U.S. air power, allied with anti-Taliban elements in Afghanistan, most particularly the Northern Alliance. While the Taliban was quickly removed from power, their influence in Afghanistan and its society remained. Even after 10 years of combat and

the formation of a democratically elected government, Afghanistan still more closely resembled a failed state than a stabilized nation. The question for much of the world remained whether it would ever be possible for Afghanistan to be truly stable.

While the opening phase of the war in Iraq involved the use of conventional power against the Iraqi army, the U.S. Army quickly found itself in an unconventional fight against both former Saddam Hussein loyalists and the international terrorist organization al Qaeda. For several years, the U.S. Army appeared unable to deal with the unconventional nature of the fight. This apparent inability to stabilize Iraq was coupled with illegal or dubiously legal incidents that embarrassed the United States internationally. Beginning with the 2007 appointment of General David Petraeus as the commander of the Multi-National Force, the situation in Iraq began to stabilize. Following the withdrawal of all American combat forces in December 2011, Iraq remained relatively stable, though concerns remained regarding the future.

The Global War on Terrorism could not have been fought without the U.S. Army Reserve and National Guard, both of which had been only lightly used since the Korean War. While much tension existed between the active and reserve forces early on, the number of deployments and amount of combat seen by the reserves gained them the grudging respect of their active-duty counterparts. More tension exists between the U.S. Army and U.S. Marine Corps, on the one hand, and the U.S. Navy and U.S. Air Force, on the other. The army and the marines, both as organizations and as individual members, had the perception that the navy and air force did almost nothing to contribute to the fight. While that is certainly an overstatement, there is no doubting that the army and the marines have done the majority of the fighting and dying, while the navy and the air force have been primarily focused on transportation and logistics.

ARMY CORPS OF ENGINEERS

The U.S. Army Corps of Engineers is one of the oldest continuously operating branches of the U.S. military establishment and has contributed in a number of ways to the military and civilian progress of the nation. This entry briefly outlines the beginnings of

the corps, its current organization, and its continuing role both in domestic and international actions.

Early History

The U.S. Army Corps of Engineers was founded on June 16, 1775, by order of General George Washington. The recognized founder of the engineers was Louis Le Bègue de Presle du Portail, a French engineer and Continental Army colonel, who headed the branch from 1777 until 1782. It became a separate and independent branch of the U.S. Army on March 16, 1802. The first duty of the corps encompassed the construction and maintenance of the United States Military Academy at West Point.

Since its inception, the corps has played a significant role in the military history of the United States. In the 20th century, it has branched out to make important contributions to the country's civilian development as well. During the early period of the corps, it focused primarily on supporting logistics during periods of conflict, such as the Mexican and Civil Wars. Preparedness occupied much of the corps's attention as well; thus, they built coastal fortifications. During times of peace, it mainly supported internal improvements to the nation. This work included surveying roads and canals and mapping the western frontier to the Pacific Ocean, a monumental accomplishment in its own right. The Corps of Engineers also worked on the construction of national monuments as well as government buildings.

The mission of the Corps of Engineers began to expand radically in the 20th century as it became a federal flood control agency as well under the Flood Control Act of 1936 and Flood Control Act of 1944. The task of flood control pushed the Army Engineers to gain greater knowledge of environmental science and the possible environmental consequences of their projects. In addition, during the Great Depression, the corps was utilized in many of the public works' projects that featured prominently as a part of the New Deal.

World War II and the Cold War

Another major turning point for the Corps of Engineers came in 1941, when the War Department tasked it with the construction of facilities for the U.S. Army and its air wing, which later became the

U.S. Air Force, both at home and abroad. This mission led to the construction of numerous military bases in the United States, as well as the building of temporary military establishments both for U.S. troops and for allies all over the globe.

Through the end of World War II and the onset of the Cold War, the corps became more involved with new projects that supported U.S. global strategy. Internationally, this translated into the construction of numerous infrastructure improvements for various U.S. allies. On the domestic front, the corps played a significant role in the construction of the Kennedy Space Center.

Beginning in the late 1960s, the environmental mission of the corps expanded as well to include natural resource management and protection of the nation's wetlands. In addition, the corps assists the various military services in environmental management at both current and former installations. Under the Water Resources Development Act passed by Congress in 1990, promoting the environment was designated a central mission of the corps.

Present Organization and Mission

Although the Corps of Engineers is a branch of the U.S. Army, most of the 34,000 members are civilians. The permanent divisions include the North Atlantic Division, South Atlantic Division, Mississippi Valley Division, Great Lakes and Ohio River Division, Southwestern Division, Northwestern Division, South Pacific Division, Pacific Ocean Division, and Transatlantic Division, which includes districts in Europe, the Middle East, and Afghanistan. Other commands that form part of the corps include the Engineer Research and Development Center, the Huntsville Engineering and Support Center, the Transatlantic Programs Center, and the 249th Engineer Battalion. The mission of the corps remains to provide vital engineering services in peace and war to strengthen our nation's security, energize the economy, and reduce risks from disasters. This mission has played out in a variety of ways in recent years.

The corps aided in the cleanup efforts after the attacks of September 11, 2001, and continues to play a significant role in the continuing Global War on Terrorism. This includes numerous reconstruction and infrastructure improvement activities, as well as overseeing the construction of American

military bases and other infrastructure. In Iraq, the efforts included not only reconstruction after the 2003 invasion but also the modernization of parts of the Iraqi oil production facilities at Basra. The corps, along with the wider American efforts in Iraq, has been criticized within the press and within Congress for lax oversight of contractors and the scores of projects that were overbudget or uncompleted.

At the same time that it has taken a significant part in the Global War on Terrorism, it has maintained its domestic responsibilities in the United States. Some of the handling of these internal challenges has led to criticism. In 2005, the corps came under heavy scrutiny for the failure of some 53 levees in and around the city of New Orleans during Hurricane Katrina. The failure of the levees along with the failure of pumping facilities led to Katrina being one of the most destructive hurricanes in the nation's history. Environmentalists were especially critical of the corps for favoring dams and levees over more less environmentally evasive ways to minimize flooding.

ARMY NURSE CORPS

Founded on February 2, 1901, the U.S. Army Nurse Corps (ANC) has provided medical care for soldiers and their families during wartime and peace for more than a century. Before the founding of the corps, the U.S. military relied on nurses to

provide medical care for soldiers but hired them to serve only as contract nurses. Thousands of nurses worked in army hospitals in the Revolutionary and Civil Wars, but as contract nurses they held no permanent status in the army. Following the Spanish-American War, however, the army deemed a permanent nurse corps necessary and created the ANC within the Medical Department. Since its founding, the corps has evolved in size and makeup, and nurses have attained greater professional status and respect. Today's ANC serves both in the United States and around the world, with approximately 9,200 nurses serving on active duty and in reserve status. This entry discusses the history and makeup of the ANC.

History: World War I to the Present

When the United States entered World War I, only 403 army nurses were on active duty, but the corps quickly grew to more than 21,000, with approximately 10,000 nurses deployed to Europe. These nurses served in a variety of hospital settings, from dressing stations that provided initial first aid to hospital trains and transport ships, as well as field hospitals, evacuation hospitals, and base hospitals located farther behind the front lines that provided increasing levels of care. In addition to war wounds—including new types of wounds and conditions particular to industrialized war—nurses worked to fight the worldwide influenza epidemic of 1918. Approximately 100 died during the war, most from influenza.

During World War II, the corps grew from fewer than 7,000 nurses on active duty before the bombing of Pearl Harbor to approximately 57,000, with 32,500 serving overseas in the European, Asian, and African theaters. Many of these nurses joined through the Cadet Nurse Corps program, which coordinated and paid for nurses' education in exchange for national service for the war's duration. As in the previous world war, nurses worked in a variety of types of hospitals and treated all manner of wartime wounds and illnesses. About 500 nurses trained to become the army's first flight nurses, and 17 among them died during the war. Overall, 201 army nurses died in the war, while another 83 were captured and held as prisoners of war, most of them in the Philippines.

Operating Room of the Malinta Tunnel Hospital in Corregidor, Philippines, 1937.

Source: Army Nurse Corps Archives, Office of Medical History, Office of the Surgeon General.

Although the number of nurses on duty declined dramatically following the war's end, the Cold War brought additional conflicts in which army nurses served. Approximately 540 nurses deployed to Korea, many working in the newly developed Mobile Army Surgical Hospitals. Five thousand nurses served in the Vietnam War between 1956 and 1973, with thousands more serving on active duty around the world. Nine army nurses died in that war (seven women and two men), one as a result of active enemy fire. In the late 20th and early 21st centuries, army nurses have deployed to conflict zones and sites of natural disasters around the world: from Grenada and Panama to the Middle East and Eastern Europe. During the Persian Gulf War of 1990–1991, approximately 2,200 nurses served in theater, most from Army National Guard units or

the Army Reserve. In 2010, nurses were stationed in both Iraq and Afghanistan.

Working in the ANC

While nurses' work has always been crucial to the army, nurses did not always find themselves treated as equal members. During World War I, nurses held no rank. After the war, Congress granted nurses relative rank, a status that provided them some authority in hospitals but less pay than other officers of the same rank. Nurses continued to hold only relative rank during World War II until June 1944, when Congress granted nurses temporary commissions with equal pay for the war's duration plus an additional 6 months' pay. The Army-Navy Nurses' Act of 1947 granted nurses permanent commissions

44th U.S. Army Mobile Surgical Hospital, Korea, 1954.

Source: Army Nurse Corps Archives, Office of Medical History, Office of the Surgeon General.

with equal pay, dependency allowances, and retirement benefits. Still, even as officers, nurses faced limitations on their careers because of restrictions on the rank women could attain. Although Congress increasingly opened more slots in ranks for women, only in 1967 did it remove restrictions that limited women to the rank of colonel, and in June 1970, ANC Chief Anna Mae Hays became the army's first female brigadier general. Beginning in 2004, the ANC chief held the rank of major general.

The gendered and racial makeup of the corps has also changed dramatically since its inception. At its founding, the "Nurse Corps (female)" admitted only single White women. Although the formal name of the corps changed in 1918, the corps steadfastly refused to admit men until 1955, when it began admitting men to the Reserves. In 1966, men secured full admission to the Regular ANC. Since then, men have become an even greater proportion of the corps, and in 2000, William T. Bester became the first male chief of the corps. In 2010, approximately one third of the corps was male. Additionally,

the corps remained a segregated institution until the 1948 integration of the military. During World War I, 18 African American women joined the corps, while the demands of World War II pushed the corps to admit even more African American women. Even then, however, the ANC segregated the 500 Black nurses who joined the corps and limited them to care of African American troops or prisoners of war. Only after the racial integration of the military did the corps end its policy of racially based assignments. Hazel W. Johnson became the first African American ANC chief in 1979.

As the corps became more diverse, it also gradually changed restrictions that limited female nurses' ability to combine their army career with marriage and family. During both World Wars I and II, the army temporarily lifted restrictions that prohibited married women from serving on active duty. In 1964, the army lifted restrictions on married women serving in the corps, and throughout the decade, it also granted some waivers to women with children who wished to remain in the service. In 1975, the

First Lieutenant James Mitchell of the 10th Mountain Division treating a civilian child, Afghanistan, 2003.

Department of Defense finally ordered that the military would no longer discharge women who became parents.

ARMY WAR COLLEGE

Located at historic Carlisle Barracks in south-central Pennsylvania, the Army War College is the premier institution within the U.S. Army for educating just over 500 military officers and selected civilians about the use of landpower within the U.S. national security strategy in a 10-month accredited master's degree program. This entry describes the

founding, curriculum, and supporting institutions of the Army War College.

Founding

Elihu Root recognized the need for significant reform to the primarily domestically focused army when he assumed the position of Secretary of War (1899–1904) under the presidencies of William McKinley (1899–1901) and Theodore Roosevelt (1901–1909) at the beginning of the 20th century. The military had performed adequately against an exceptionally weak Spanish foe in the War of 1898, but Root realized that the resulting colonies that the United States won would require changes to the army. In 1901, he oversaw the establishment of the Army Senior Service College at Roosevelt Hall in southwestern Washington, D.C., with the initial students arriving in 1904. The college educated senior-level officers to examine the use of land power by the United States.

With the advent of World Wars I and II, the nation began incrementally realizing that new institutions with an ever broader grasp of strategy were required. Many of these became interservice, then “joint” institutions, such as the Army Industrial College becoming the Industrial College of the Armed Forces after World War II. The Army War College, with its emphasis on the various branches of the U.S. Army and use of landpower in instances of strategy, had closed at the beginning of World War II and lost its building at the newly renamed Fort Lesley J. McNair when the National War College opened in 1946. The college reopened at its present location in 1951.

Curriculum

The Army War College offers a senior service school education for lieutenant colonels and colonels in the army, along with civilians and some officers from other services, for a 10-month master’s degree accredited by the Middle States Association for Higher Education. The Service War Colleges—the Army War College; the Marine War College at Quantico, Virginia; the Navy War College in Newport, Rhode Island; and the Air War College at Maxwell, Alabama—each has a greater portion of its students from its home service with a smaller number of civilians and officers from the other services than do the two entirely “joint” schools, the Industrial College of the Armed Forces and the

National War College. The Army War College also has a number of international officers from around the world, invited at the behest of the chairman of the Joint Chiefs of Staff, to learn about the United States, the Army, and the U.S. national security community while sharing their nations’ views.

The curriculum at Carlisle has three primary drivers: (1) strategic leadership, (2) strategy theory, and (3) strategic practice. The college organization conforms to these concerns, but the students take courses more broadly linked to the mission, such as national security policy and strategy, instruments of power, theater strategy, change in complexity, and strategic leadership. The seminar method is the primary educational tool to foster debate and critical thinking. The Army War College also has a significant number of students enrolled in a distance learning option rather than attending courses in Carlisle.

The faculty is a mix of active-duty officers, agency personnel seconded to the college for a fixed period of time, and Title X civilian academics hired under fixed contracts. This faculty teaches, engages in outreach, and provides research for the broader community and the army itself. The research of some of the faculty has provided some of the most compelling material for debate on the army’s doctrine, operational decisions, strategic concepts, and overall national security strategy, making it a highly desirable location for teaching eager, challenging, fully engaged students in an environment fostering highly respected discussion. At Carlisle, a national group of academics within and outside the professional military education community has been engaging in cutting-edge assessments of whether the appropriate approach to teaching strategy is being implemented and considered around the nation.

Students study and live on post at Carlisle Barracks, with their families. The curriculum involves seminars, lectures, reading, and physical activities. The intention is to broaden students’ ability to analyze beyond their superb operational skills to the higher level decision making required to “master the strategic art.”

Supporting Components

The Army War College has a superb array of supporting institutions for its overall mission. The Center for Strategic Leadership, known as the Collins Center, supports the army and Joint Staffs

through research, war-gaming, and conference activities that allow unfettered discussion along with serious analysis, through writing and simulations, of pending and potential leadership challenges for the army and the nation.

The Peacekeeping and Stability Operations Institute, created in the 1990s, is pivotal to the development of the army's doctrine on peace operations and stability concerns. It also serves as a magnet for discussions on government policy in this area, with representatives from nongovernmental organizations, foreign armies, and other interested parties.

The Strategic Studies Institute is probably the most prolific research organization for any of the senior service schools in the U.S. military. The Strategic Studies Institute does research directly for the army and Joint Staffs while also hosting conferences at Carlisle. The Strategic Studies Institute also hosts a dazzling array of meetings in conjunction with academic institutions around the nation. In most cases, both hard copy and electronic summaries of the conference proceedings offer a continuous mechanism for debate in the national security field.

The Army War College has two other less academic but important bodies under its control in Carlisle. The Army Heritage and Education Center allows a better understanding of the army's history through a large collection of manuscripts, books, maps, artifacts, and photographs, open to the public. Similarly, the Army Physical Fitness Research Institute assists with keeping the force in the most effective condition. These centers operate as part of the Army War College community.

ARMY-NAVY GAME

The Army-Navy game represents one of the most important rivalries in college football and dates back to 1890. The football contest pits the military's two oldest commissioning institutions against one another, and the yearly game has come to embody the spirit of interservice rivalry. This entry discusses the history of the Army-Navy game and some of the game's traditions.

History

The cadets of the United States Military Academy and the midshipmen of the United States Naval Academy first met on the gridiron in 1890 when a newly formed Army football team challenged a Navy team that had been in existence since 1879 to a game at West Point. The experienced Navy team shut out the cadets and began one of the most storied college football rivalries. The teams have played every fall since then, except for a 10-year span in the late 1890s and early 1900s, and the midshipmen hold a slight advantage in the series.

Both academies have football programs steeped in tradition and glory, fielding Heisman Trophy winners such as Army's Glenn Davis and Navy's Roger Staubach. In the first half of the 20th century, the

Army-Navy was the most important football game in the nation, often having national championship implications. Beginning in the 1960s, with the coming of the Vietnam War and the increasingly unpopular attitudes toward the military, the luster of the game began to fade. Nonetheless, its significance to the military academies remained. Each year, cadets and midshipmen in both academies, serving members of their respective military branches, and alumni look forward to the one fall day in which their branch of military can prove its superiority and gain bragging rights. The game highlights a competitive interservice rivalry and symbolizes the competitive achievement of the U.S. military.

The Game

American football is often compared with war. Coaches are generals and their staff the officer corps. The players are the soldiers, each position's job being well defined and hierarchically ranked. Two teams meet on a field of battle and violently clash with one another for an hour, attempting to obtain victory from a prepared strategy. The cadet and midshipmen football players understand the fantasy of this metaphor. Unlike nearly all other college football players, for the Army and Navy players, football is the easiest part of their strictly regimented life. The players on each team are among the best and brightest their country can offer. They are at their respective academies to become commissioned officers serving their country. When their 4 years of schooling are over, they are committed to years of military service. The seniors (first classmen) playing for victory in the Army-Navy game often find themselves serving side by side for their country the following year. In times of war, this becomes one of the most poignant aspects of the Army-Navy rivalry.

In the early years of the Army-Navy game, when both teams represented the most elite football programs in the nation, several important factors helped ensure the importance of the contest. College football was not the training ground for the National Football League (NFL) it is today, officer pay was generally much better than a professional football player's, military drafts meant that many of the nation's best athletes had to serve their country, and the undefeated record of the United States in war enticed many young men to serve. All of these things created an atmosphere in which the military

academies were juggernauts in the football world and explain why an Army football team won three consecutive national championships from 1944 to 1946.

Once the Cold War began, some of the prestige surrounding the armed forces began to wane. The wars fought in Asia did not possess clear-cut objectives, and achieving victory became much more problematic. Young men were more reluctant to commit to a military academy, especially after the draft ended. At the same time, the National Football League emerged as a more profitable league. Football players needed success in college to prove themselves worthy of lucrative professional pay. The rigid height and weight requirements at the military academies, along with the mandatory military commitment immediately following college, were detrimental to recruiting. Eventually, they just could not field teams that could play teams like Notre Dame or Penn State competitively each season.

Faltering national competitiveness lessened the media frenzy around the Army-Navy game but in no way affected its well-entrenched tradition. The game continues to be nationally televised and attracts a respectable number of viewers. Attendance at the game, usually played in Philadelphia (a neutral site roughly halfway between Annapolis and West Point), is also exceptionally good. The Army-Navy game is the last game of the season for both academies and also the last regular season college football game, giving it sole possession of the national spotlight. The outcome sometimes decides where the yearlong home of the Commander in Chief's Trophy will be, although since the Air Force Academy entered the mix in 1982, the point has often been moot.

Spectators witness a type of football rarely seen during a Division I season. Both academies generally field players considered undersized and undertalented by today's National Football League standards. The amount of passion seen in the players, however, is second to none. The game is usually characterized by hard-hitting defenses and offenses that rely on a grinding running game. No matter what the talent difference between the teams, the game is often low scoring and close. When the final whistle blows, both schools stand side by side and sing each other's alma maters in front of their student bodies (the winning team's is sung last). Players' emotions during this tradition often come to the surface because winning

the game is of great significance to both schools. This symbolic act demonstrates that although each academy wants nothing more than to beat the other, the U.S. Armed Forces are a unified body. The singing of the alma maters is the most moving aspect of the game to many Americans. This 120-year rivalry stands as one of the great athletic traditions in the United States and provides American civilians a rare look at the composure and resilience of the future leaders of their armed forces.

ART, COMBAT

Traditionally, artists have recorded scenes of fighting as illustrators or in a fine arts tradition with battles based on secondhand observation or created in the artist's imagination. Gradually the concept of the combat artist emerged as an artist who had witnessed military action on the spot, a soldier first, an artist second. These artists were given freedom of expression and subject matter. They made sketches and photographs in the midst of battle and then finished their work in a studio setting. Combat art recorded the human experience of war: a brutal reality interspersed with quiet moments of waiting. The combat artist added an important third dimension to the battle experience, one that photographs and videos cannot capture.

The combat art program began in World War I, when the U.S. Army commissioned eight artists into the Corps of Engineers to record the activities of the American Expeditionary Forces in France. In 1943, a World War II War Art Unit and War Art Advisory Committee was formed, which eventually selected 23 active military artists and 19 civilians to

record and interpret military operations. On August 31, 1943, Congress withdrew funding, but private corporations stepped in to finance the military art programs. By June 1944, Congress reinstated the soldier-artists, who eventually portrayed campaigns worldwide. No official artists worked during the Korean War, but combat art programs were reinstated during the Vietnam War for both military and professional artists. The combat art program has continued to exist to the present. However, due to budget cuts, the number of working combat artists has diminished, down to one in each service. Although separate branches of the military maintain their own collections, all services work together to document military history, to inform the public about what the services do, and to record the war-time experience of fellow soldiers through art. This entry describes combat art and records activities of the different services.

Combat Art Programs

The U.S. Army's War Art Unit in World War II combined both military and private ventures. The Army's War Art Advisory Committee worked with Abbott Laboratories (which funded artists to record medical activities) and with *Life* magazine, with consultants from Associated American Artists, and with *Yank* magazine and the *Stars and Stripes*. Between 1960 and 1975, the Army's Vietnam Combat Artist Program selected both civilian and military volunteer artists, sending 57 artist-soldiers for 60 days into the war zone in two- to five-man teams on a continually rotating basis. Since 1966, the program has covered operations worldwide under the Army Artist Program. In 1992, the Staff Artist program began, where one official soldier-artist served at a time. This body of work evolved into the U.S. Army Art Collection cared for by the U.S. Army Center of Military History, which now comprises 15,000 works of art and objects. Currently, there is an Artist in Residence at the U.S. Army Center, MSG Martin Cervantez. The Army also holds artifacts (uniforms, weaponry, and tanks), has a portrait collection, and maintains 60-plus smaller museums.

The Navy Combat Art Program was founded in 1941 by a soldier-muralist, Griffith Baily Coale, who convinced navy commanders to send eight active-duty artists into the field. Navy artists completed regular duties first; art work was off-hours.

Also, Abbott Laboratories supplied civilian artists to record naval operations in World War II: naval aviation, medicine, submarine warfare, and the U.S. Marines. Abbott gave 300 works by 18 artists to the Navy Art Collection after the war. Two navy military artists served during the Korean War. The revived Navy Combat Art Program in Vietnam operated with the help of the Salmagundi Club of New York, which supplied civilian artists paid by the military to cover naval combat areas. The Navy Combat Art Program merged with the Naval Historical Center, sending artists to noncombat venues as well.

Since 2003, navy artists have covered specialized support operations for Iraq and Afghanistan in the Mediterranean Sea, as well as medical rehabilitation at Walter Reed Medical Center. The artist Morgan Wilbur, staff member of the Naval Historical Center, lived and worked on an aircraft carrier and recorded Navy Medicine's programs in Iraq as well as coalition activities in Baghdad. The Naval Art Collection at the Washington Navy Yard includes navy painters, historical naval prints, and important American artwork by Gilbert Stuart and Thomas Hart Benton.

The Marine Corps Combat Art Program began after Pearl Harbor and diminished after Vietnam. During the Cold War, the program developed a mission-based program with short-term assignments to flare-up situations. The Global War on Terrorism changed this format. Since then, mobilization of reservists-artists can be for extended terms. Since 2006, Sergeant Kristopher J. Battles, combat artist in residence, has been on a yearly tenure, painting in Iraq, Afghanistan, and Haiti. A new studio at Quantico allows the artist time to grow and time to experiment. The marine program prides itself on its high artistic standards and on its human vision of war. The program continues to cover current U.S. Marines' combat, support activities, and humanitarian roles. There are now 8,000 works in the current collection. Many are housed at the National Museum of the Marine Corps, which has received 2 million visitors since 2006.

The Coast Guard Art Program and the U.S. Air Force Art Program cannot technically be considered combat art because artists do not work in war situations. Coast Guard artists are volunteer professional artists chosen in a partnership with the Salmagundi Club in New York City. There are 1,800 works in

the collection. The Air Force Art Program recruits artists through professional groups such as the Society of Illustrators in New York. There are 9,000 works in its collection.

Critics label combat art programs as impractical, out of step with high-tech war, losers to Hollywood glitch, and subject to military cutbacks. Soldier-artists must now lobby commanders to be deployed, and control of art has increasingly moved to museums. Yet the artist-soldier tradition remains with committed supporters and shall probably continue in the future.

ARTILLERY

Artillery is the science of using mechanical advantages, most frequently using combustible propellant, to deliver a projectile with formidable violence against a target at considerable distance. Artillery is classified as cannon, mortar, and howitzer. Cannon are capable of firing only at a flat trajectory, at targets directly within view of the gun. Today, cannons are typically employed only on tanks or infantry fighting vehicles such as the Bradley. Mortars are capable of firing only at a high angle and are, thus, able to attack targets in a defile, hidden behind buildings, structures, vegetation, or terrain. Howitzers are a hybrid weapon, capable of firing at both low angle for direct engagements and high angle for indirect engagements. Nearly all artillery pieces employed today are howitzers, with mortars being relegated as infantry weapons. This entry describes the

development of artillery, types of artillery, technology, and current use.

History

Ancient armies including the Greeks and Romans used various devices such as catapults, ballistae, and trebuchets to pummel their opponents. By the early 13th century, primitive cannons were employed in Europe against castles, using black gunpowder to propel solid projectiles that could batter their way through stone or earthen walls. This prototypical artillery was heavy, slow-loading, and lacked maneuverability. The earliest projectiles were nothing more than massive, roughly round stones that lacked accuracy or range. However, by the middle of the 18th century, artillery was a well-established field with bronze cannons that were relatively lightweight and mobile, accurate at extended ranges, and capable of firing various types of projectiles.

The 19th century was marked by remarkable technological improvements, which created the field artillery as it is known today. By the time of the American Civil War, rifled artillery cannon were being mass produced, and the first efficient and effective breech-loading cannon also saw employment in that conflict. By the Spanish-American War of 1898, smokeless gunpowder was in widespread (although not yet universal) use. The single greatest advancement in artillery occurred with the development of the French 75-mm cannon in 1897, which for the first time employed an effective recoil mechanism. Although various recoil techniques had been proposed since the middle of the 19th century, the French 75 mm was the first gun to be mass-produced and deployed with such a system. An artillery recoil system is a hydraulic, pneumatic, or spring-type shock absorber that decreases the energy of the recoil and eliminates the “opposite reaction” of the gun that moves it backward in response to the “action” of the gun’s firing and, thus, requires it to be re-aimed after each shot. The recoil mechanism permitted effective indirect artillery fire for the first time in history (engaging targets that the gun cannot see through the use of observers) and revolutionized the use of field artillery.

Today, most mortars rarely contain any recoil system, remain smooth bore, and are fired by dropping projectiles down the muzzle, which considerably reduces their weight and enables these systems

to be carried by the infantry. Modern field artillery systems are nearly exclusively breech loaded, rifled, and contain recoil systems of various designs. Ranges in excess of 30 kilometers can be achieved with accuracy by most modern 155-mm field artillery systems, and even the heaviest 155-mm system can sustain rates of fire well above one round per minute.

The advent of recoil systems, indirect fire techniques, considerable enhancements in accuracy, advanced projectile effectiveness and lethality, significant improvements in the flexibility of projectile types (e.g., smoke, gas, high explosives, and shrapnel), and much better reliability and precision brought artillery into preeminence in the First World War. A formal system of controlling and directing fires was established, consisting of forward observers serving with the combat arms to request, observe, and adjust fires; a fire coordination element with headquarters units to coordinate the use of field artillery; a fire direction element to translate the forward observers’ directions into firing commands to the guns; and the artillery pieces themselves. During World War I, World War II, the Korean War, and the Vietnam War, field artillery and mortars were the greatest killers on the battlefield. By 1914, artillery enjoyed a reputation as “The King of Battle” as indirect artillery fires dominated any engagement. During these years, the artillery mastered refinements such as manipulating the fall of projectiles to conform to a terrain feature such as a ridge or trench line; massing of artillery pieces to command a point on the battlefield; integrated missions with different types of guns or projectiles; “time on target” fire missions, at which artillery rounds fired from dispersed artillery units at varying ranges and with different times of flight would arrive simultaneously; rolling barrages designed to advance at the rate of an infantryman; box barrages designed to isolate a specific target to facilitate raids and attacks; and zone and sweep missions capable of ranging artillery projectiles across a piece of terrain of varied dimensions.

The Electronic Numerical Integrator and Computer, the world’s first electronic, digital computer, was developed to calculate field artillery ballistic firing tables during World War II. By 1959, electronics had advanced to the point that the Field Artillery Digital Automatic Computer was fielded. Essentially a large, heavy table with folding legs, it

had limited capability, and an efficient manual fire direction center could beat it, yet it represented the initial tactical computerization of the artillery.

The Post–Cold War Era

By 1990, North Atlantic Treaty Organization and Warsaw Pact field artillery had achieved the pinnacle of development as an industrial warfare force that could command the battlefield with firepower and lethality. The U.S. Army fielded the Tactical Fire Direction System, which consisted of an integrated digital fire control system and a console-sized battery computer system used for all fire direction computations, and individual firing data could be electronically transmitted to each firing piece by a device called the gun display unit. Digital phased array radar systems known as the Firefinder facilitated rapid and accurate counterfire. Conventional field artillery pieces were augmented by the multiple-launch rocket system, a single launcher of which is capable of simultaneously placing devastating fires on an entire square kilometer. Conventional field artillery could employ a wide and diverse range of customized projectiles far beyond the conventional high explosive round, including antipersonnel such as flechette rounds (short-range rounds developed by the U.S. Army for Vietnam, containing a multitude of small metal darts), various poison gas rounds, scatterable antipersonnel and antivehicular mines, obscuring smoke, white phosphorous for marking objectives or targets, antitank, illumination, improved conventional munitions capable of engaging different target types over a large area with deadly effects, and even remotely delivered sensors. The result was an integrated, robust, highly mobile, and flexible system that absolutely controlled the battlefield. North Atlantic Treaty Organization and U.S. artillery systems played a major role in Operations Desert Shield and Desert Storm in the Saudi Arabian–Kuwaiti–Iraqi deserts in 1990–1991. Since then, refinements such as the Advanced Field Artillery Tactical Data System have continued to accelerate and miniaturize field artillery support systems.

However, the field artillery has proven less versatile and capable in the military operations other than war that have dominated the globe since the Persian Gulf War. Field artillery has seen significantly reduced employment in counterinsurgency operations of the later decades of the 20th century.

In the Somalia deployment by the U.S. Army in 1992–1994 (originally to provide humanitarian aid, later to end rival clan conflicts), a single artillery illumination round was fired. Artillery saw no employment whatsoever in operations in Haiti in 1994–1995 (to restore to power the democratically elected president of Haiti). This is because field artillery was not capable of precise targeting, and the absence of such precision artillery tends to cause extensive collateral damage such as the destruction of adjacent structures and inflict serious civilian casualties. An early effort to improve accuracy was the M712 155-mm Copperhead laser-guided artillery round, fielded in the early 1980s by the U.S. Army and only recently withdrawn from active service (in 2007). The Copperhead followed the guidance of a laser beam to strike with considerable accuracy, although the “footprint” within which it could operate was limited, it could only be used on static targets, and its accuracy was dependent on technical limitations of the laser beam itself. The round was also prohibitively expensive at nearly \$500,000 apiece.

The increased growth in field artillery systems was also to blame for this reduction in utility, as subsequent field artillery systems became so heavy as to demand considerable transportation assets. They are difficult and slow to deploy, complex and challenging to sustain, and have limited tactical flexibility to respond to hybrid wars and insurgency. U.S. secretary of defense Donald Rumsfeld realized this when in the spring of 2002 he cancelled the U.S. Army’s cherished “Crusader” 155-mm field artillery concept, a hideously expensive and technically intricate, 41-ton behemoth of an artillery piece, whose effectiveness was limited to conventional combat with an industrial-age mechanized force supported by a well-established logistical tail.

Artillery is also constrained in current Global War on Terrorism operations due to range and terrain restrictions. The artillery has always been concerned with range, and various methodologies have been explored to increase range, such as rocket-assisted projectiles, which generally lacked accuracy but retained larger payload capacity and are favored by the U.S. Army, and various types of base bleed/extended-range projectiles favored by European militaries (which significantly extend range without a deterioration of accuracy but have limitations in payload and thus explosive capability). Rocket-assisted

projectile rounds contain a rocket motor that provides additional thrust, while base bleed/extended-range projectiles contain a small quantity of propellant in the end of the round that does not provide any thrust but increases the air pressure at the base, thus extending its range, and also contain an aerodynamically enhanced shape. In Afghanistan, most fire missions are necessarily conducted at a high angle because of the extremes of topography, which reduces accuracy and causes increased wear to the carriages. The heavy weight of the M198 155-mm howitzer (16,000 pounds) has also limited its use in remote locations in Afghanistan, as the road system in that country is poor and the terrain demanding. The extended ranges at which artillery is being employed in Afghanistan often require maximum propellant charges, which place additional stresses on the carriages and frequently demand the use of rocket-assisted projectile rounds, which further degrades accuracy.

The recently fielded M777 155-mm howitzer is a considerable improvement in mobility; this is the first 155-mm howitzer fielded by the U.S. Army and the United Kingdom to weigh less than 10,000 pounds, and it has proved invaluable in operations in Afghanistan. The M777 155-mm howitzer can sustain rates of fire of two rounds per minute and can achieve a maximum rate of fire as high as five rounds per minute (although this rate of fire cannot be maintained). Its reduced weight enables it to be maneuvered relatively easily and rapidly across various types of ground, considerably enhancing its utility in challenging terrain such as Afghanistan. Although field artillery has not been extensively employed in Iraq, the considerable distances, comparatively lower density of population, and isolation of numerous forward operating bases and combat outposts in Afghanistan have led to considerable employment of artillery-delivered firepower there. For example, for 15 months in 2007–2008, the 2nd Battalion, 503rd Airborne Infantry of the 173rd Airborne Brigade Combat Team employed 36,225 artillery and mortar projectiles in Nuristan and Kunar Provinces.

The U.S. Army recently (2007) fielded the M982 155-mm artillery projectile Excalibur, which may prove to be the most significant field artillery advancement since the recoil mechanism was perfected by the French more than a century ago. As recently as the late 1980s, electronic technology had

not sufficiently matured to enable delicate, precision electronics to survive the brutal G-forces and rotational spins generated by a modern howitzer. The Excalibur exploits recent miniaturization and “hardening” of electrical components to install Global Positioning System technology inside an artillery projectile. The Excalibur round has been described as “unbelievably accurate” by artillerymen firing it in Iraq, enabling it to be successfully employed within 50 meters of friendly troops. It is accurate to within 10 meters at 14 miles; and future versions are intended to achieve 10-meter accuracy at 24 miles. With such precision, engagement of individual houses is now possible, a feat that has been repeatedly demonstrated in Iraq.

With the deployment of relatively lightweight 155-mm howitzers such as the M777, and the Global Positioning System–guided Excalibur projectile, it is conceivable that field artillery will regain the mobility and precision necessary to function in a population-centric counterinsurgency battlefield, where a precise, timely engagement is more to be desired than the massive, preplanned, thundering barrages of the battles of Somme and Verdun during World War I.

ASIA

The end of the Cold War had different effects on the strategic environment in Asia and Europe. On the one hand, the collapse of the Soviet Union terminated a military confrontation between two military alliances, the North Atlantic Treaty Organization and the Warsaw Treaty Organization. This resulted in the expansion of the North Atlantic Treaty Organization and the European Union, including most European states west of Russia, as well as the dissolution of the Warsaw Treaty Organization in July 1991. On the other hand, with the end of the Cold War in Asia, the U.S. military presence in the region was reduced, while Russia ceased to be a significant actor on the Asian security scene. As a result, a sort of strategic vacuum removed the lid over local conflicts in the Korean Peninsula, the Taiwan Strait, and the South China Sea. In addition, as power relationships in Asia became fluid and uncertain, long-standing rivalries began to inflame tensions. Moreover, after the September 11, 2001, attacks in the United States, terrorism has emerged as a new strategic challenge for Asia. This entry describes the recent security environment in Asia since 1989, focusing on some potential flash points.

Tension on the Korean Peninsula

Since 1991, North Korea's nuclear and ballistic missile programs have posed serious international security threats. Although North Korea concluded a

safeguards agreement with the International Atomic Energy Agency in 1992, North Korea refused International Atomic Energy Agency inspections in 1993–1994 and ignored the South-North Joint Declaration of the Denuclearization of the Korean Peninsula in 1991 as well as the request of the UN Security Council in May 1993. Tensions ran high on the Korean Peninsula when North Korea threatened to withdraw from the Nuclear Non-Proliferation Treaty and then to go to war if sanctions were imposed by the international community. In May 1993, North Korea also fired a Nodong missile into the Sea of Japan, which demonstrated that Japan was within the 1,000-kilometer range of the missile.

However, following former U.S. president Jimmy Carter's visit to Pyongyang in June 1994, South-North talks were resumed. Finally, the U.S.-North Korean Agreed Framework was signed in October 1994 to replace North Korea's nuclear power plant program with light water reactor power plants and for a step-by-step normalization of relations with the United States. In March 1995, the United States, South Korea, and Japan created the Korean Peninsula Energy Development Organization as a responsible consortium for implementing the energy-related parts of the agreement, including provision of heavy fuel oil for North Korea.

North Korea admitted to having a secret uranium enrichment program when U.S. officials visited Pyongyang in October 2002. The following month, the Korean Peninsula Energy Development Organization decided to suspend further heavy fuel oil shipments to North Korea. In December 2002, Pyongyang declared the Agreed Framework dead and announced that it would restart operation of its frozen nuclear facilities and construction on its 50- and 200-megawatt reactors. In January 2003, North Korea announced its withdrawal from the Nuclear Non-Proliferation Treaty.

The Six-Party Talks were established in August 2003 to seek a diplomatic solution to the problem of North Korea's nuclear weapons program. The six parties (China, North Korea, Japan, South Korea, Russia, and the United States) signed a "Statement of Principles" in September 2005, whereby North Korea agreed to abandon that program in exchange for a package of security assurances and economic and political incentives. The process was divided into three steps: (1) a freeze, (2) disablement, and (3) dismantlement.

Six rounds of the Six-Party Talks from 2003 to 2007 failed to resolve the fundamental issue of North Korean nuclear arms. After North Korea launched seven missiles into the Sea of Japan in July 2006, including a long-range Taepodong-2 with the theoretical capacity to reach the continental United States, and conducted its first nuclear test in October 2006, the Six-Party Talks in February 2007 agreed to provide economic and diplomatic benefits to North Korea in exchange for a freeze and disablement of Pyongyang's nuclear facilities. The United States decided to remove North Korea from the list of state sponsors of terrorism in October 2008. However, disagreements over the verification protocol between Washington and Pyongyang stalled the process. North Korea finally announced its withdrawal from the talks in April 2009 and conducted its second nuclear test in May 2009.

The expectation that North Korea would return to the Six-Party Talks was shattered by the sinking of the South Korean naval warship *Cheonan* in March 2010, which killed 46 South Korean sailors. Although a multinational investigation team announced that a North Korean torpedo attack caused this destruction, China and Russia refused to take up this issue at the UN Security Council because Pyongyang denied involvement in the attack. Tensions on the Korean Peninsula were further heightened by Pyongyang's November 2010 shelling of a South Korean island, killing two South Korean soldiers and two civilians. It was North Korea's first direct artillery attack on South Korean territory since the 1950–1953 Korean War. Massive joint military exercises by the U.S.–South Korea alliance in the Yellow Sea were held immediately after the shelling, featuring a U.S. aircraft carrier and F-22 aircraft. North Korea then disclosed the uranium enrichment facility with 2,000 centrifuges, which could be used to produce fissile material suitable for nuclear weapons, replacing its existing plutonium-based facilities.

After Kim Jong-Il's sudden death in December 2011, the United States and North Korea reached the February 29, 2012, "Leap Day Agreement" of suspending nuclear weapons tests and uranium enrichment in exchange for food aid. Since North Korea launched a long-range ballistic missile on April 13, 2012, the bilateral agreement could not open the door to the eventual resumption of the Six-Party Talks. The new regime under Kim Jong-un,

the youngest son of Kim Jong-Il, officially maintains the *Songun*, or "Military First" policy. However, the internal balance of power in Pyongyang's decision-making circle seems to increasingly shift from the military to the Korean Workers Party, as shown by the fact that Choe Ryong-hae was promoted to director of the General Political Bureau of the Korean People's Army from party secretary. On the one hand, this would further deepen links between the Korean Workers Party and the Chinese Communist Party. On the other hand, it is possible that intense power struggles destabilize a collective leadership during a transition period.

The Taiwan Strait

The Taiwan Strait had been the most sensitive and complex issue in Asia that could lead to potential U.S.-China conflict during the Cold War era. Although China, Taiwan, and the United States have expected to maintain the status quo in the Taiwan Strait since the early 1970s, each party had different definitions of the status quo. China tried to prevent Taiwan from independence, insisting that Taiwan is a part of "one China." (Republic of China, ROC, is part of "one China" in that People's Republic of China, PRC, is only one sovereign state and the sole legitimate representative of both mainland China and Taiwan.) Taiwan as an independent entity rejected any form of unification with China. The United States did not allow any unilateral action that might alter the peaceful status quo.

Since the late 1980s, political tensions across the Taiwan Strait surged dramatically due to democratic regime transition and a national identity change in Taiwan. In February 1991, the Lee Teng-hui government redefined cross-strait relations as "one country, two equal political entities." Following the announcement of the sale of 150 F-16 fighter jets to Taiwan in August 1992, the United States granted a visa to President Lee in mid-1995. In his speech at Cornell University, he said that "the Republic of China on Taiwan is a sovereign state."

In response to the deviation from the one-China principle by Taiwan, China conducted a series of missile tests in the waters surrounding Taiwan from July 1995 to March 1996. China intended not only to warn the Lee Teng-hui government against moving away from the one-China policy but also to send a message to the Taiwanese electorate that voting for

Lee Teng-hui in the first direct presidential election in 1996 meant war. At the same time, China's objective was to coerce the United States to end its indirect support for Taiwanese independence. Responding to Chinese missile tests and military exercises, the Clinton administration deployed two aircraft carriers in December 1995.

Ultimately, the 1995–1996 Taiwan Strait Crisis ended without war. U.S.-China-Taiwan relations tentatively improved after the crisis until 2000, although new tensions emerged in May 1999 when the United States accidentally bombed the Chinese embassy in Belgrade. In 1998, the U.S.-China Agreement on Establishing a Consultation Mechanism to Strengthen Military Maritime Safety was signed as a confidence-building measure. However, the crisis was a critical turning point in post-Cold War U.S.-China-Taiwan relations. On the one hand, after the crisis, China has demonstrated clearly its willingness to use force despite its announced policy of “peaceful unification” since 1979. In March 2005, China adopted the anti-secession law, suggesting that China would not allow Taiwan to secede and that the Chinese were willing to fight for this cause. To make this threat credible, China has steadily upgraded its missile, submarine, electronic, and amphibious attack capabilities.

On the other hand, the United States began to expand the closer military ties with Taiwan to levels unprecedented since 1979. In March 2000, the Democratic Progressive Party and its candidate Chen Shui-bian won the second presidential election, ending Taiwan's 55 years of rule by the Kuomintang, or Nationalist Party of China. President George W. Bush stated in April 2001 that the United States would do “whatever it takes” to help Taiwan defend itself. The Bush administration decided to approve the sales of diesel-electric submarines, P-3 antisubmarine warfare aircraft, and four decommissioned USS *Kidd*-class destroyers.

However, U.S.-Taiwan relations have changed again with the increasing complexity and unpredictability of Taiwan's political environment. As President Chen Shui-bian was reelected in May 2004 and adopted the more provocative position that Taiwan already “is an independent, sovereign country,” the United States sought to balance criticisms of the Chinese military buildup with its commitment to defend Taiwan, stating that U.S. support for Taiwan is not unconditional but has limits. This

represented a marked departure from the early days of the Bush administration, when the White House seemed to choose “strategic clarity” rather than “strategic ambiguity” on Taiwan as its long-standing policy.

Fears of cross-strait contention were eased in March 2008 when Ma Ying-jeou of the Kuomintang party was elected as president, advocating greater policy caution and more engagement with China. Taiwan moved quickly to start bilateral talks that had been stalled since 1998. As a result of three rounds of cross-strait talks from June 2008 to April 2009, both sides agreed on cross-strait crime fighting, mutual judicial assistance, and promoting mainland investment in Taiwan. The United States welcomed the improvement of cross-strait relations, but in October 2008, the George W. Bush administration notified Congress of its intention to sell a package of defense articles and services to Taiwan to maintain the “status quo” between the two sides. In January 2010, the Obama administration announced \$6.4 billion arms sales to Taiwan that involved PAC-3 missile defense systems, Black Hawk utility helicopters, and Harpoon antiship training missiles—based on the assessment that the balance of forces across the Taiwan Strait has continued to shift in China's favor.

The South China Sea

The South China Sea is home to the world's second busiest international shipping lanes. More than half of the world's supertanker traffic and 80% of the crude oil to Japan, South Korea, and Taiwan pass through this area. Because of its geographical importance, territorial disputes over the islands in the South China Sea have been regarded as Asia's major security flash point. They are claimed in whole or in part by Vietnam, China, Taiwan, the Philippines, Malaysia, and Brunei.

The Paracel Islands in the South China Sea have been under the control of China since the end of combat in January 1974 between the naval forces of South Vietnam and China. At that time, Chinese forces sank three Vietnamese supply ships, killed 72 Vietnamese, and captured 9. In May 1988, a naval confrontation between Vietnam and China took place again over Johnson South Reef in the Spratly Islands. By the end of 1988, China occupied six atolls in the Spratly Islands. A strategic vacuum in

the South China Sea, brought about by the 1990 Soviet Union departure from Cam Ranh Bay in Vietnam and the 1992 U.S. withdrawal from Subic Naval Base and Clark Air Base in the Philippines, prompted disputing claimants to recalculate the strategic implications to the South China Sea.

In 1992, China passed the Law of the People's Republic of China on the Territorial Waters and Contiguous Area. It unilaterally justified China's claims in the South China Sea and the right to use force to protect its islands and their surrounding waters. Foreign ministers of the Association of Southeast Asian Nations (ASEAN) signed the ASEAN Declaration on the South China Sea in July 1992, where it provided that all parties were to apply the principles based on self-restraint, the nonuse of force, and peaceful resolution of disputes. However, China occupied Da Lac Reef, claimed by Vietnam, soon after the ASEAN Declaration.

Moreover, in February 1995, China encroached on the Philippines-claimed Mischief Reef in the Spratly Islands. The Mischief Reef incident marked the first time that China unilaterally changed the status quo at the expense of an ASEAN member state and covertly established its presence in an area claimed by the Philippines within its Exclusive Economic Zone. The United States opposed the threat or use of military force to assert any nation's claim but reiterated its long-standing policy on the South China Sea that the United States took no position on the legal status of competing claims. Indeed, the United States stated that the 1951 Mutual Defense Treaty with the Philippines did not cover Mischief Reef. In October 1998, a Philippine Military surveillance aircraft reportedly noticed four naval supply ships with about 100 workers constructing a landing strip for aircraft off Mischief Reef, although China claimed that it was only replacing the temporary shelters for fishermen with permanent ones constructed in 1995.

Since 1995, China has not seized additional disputed islands in the South China Sea. In November 2002, all ASEAN claimants and China signed the Declaration on the Conduct of Parties to diminish the threat of war in the South China Sea and to create an environment for cooperation, peace, and stability in the region. However, the implementation of the Declaration on the Conduct of Parties depends on the goodwill of its parties. Above all, the fundamental conflicts over Taiwan have not been resolved.

Therefore, the stalemate in the South China Sea may be unlikely to continue. Indeed, China has been strengthening its naval power. Other claimants also have an incentive to expand their maritime capabilities to strengthen their positions preparing for the possibility of local naval clashes. Chinese aggressive patrolling in the South China Sea has led to several incidents, such as China's confrontation with the surveillance ship USNS *Impeccable* in March 2009.

Growing Power of China

In conjunction with its rapid economic development, China has been modernizing its military since 1979. Chinese defense spending has increased by double-digit rates annually since 1989. The 1991 Persian Gulf War made China recognize the urgency of building force structure, strategies, and tactics. As a result, China has dramatically improved its military capabilities on land and sea, in air, and in space. In particular, the pace and scope of its naval modernization effort appear to have been reinforced by the 1995–1996 Taiwan Strait Crisis. A powerful Chinese navy does not only bolster China's anti-access and area-denial capabilities but also enables Beijing to defend China's expanding national interests.

Until the 1980s, China's naval strategy was known as "near-coast defense" to protect its coastline from invasion. Admiral Liu Huaqing, as the commander of China's navy from 1982 to 1988, advocated developing the navy to keep pace with China's rapid economic growth and changes in modern naval warfare. Transitioning to "near-seas active defense" in the 1980s, China sought a much larger area than before, covering the waters within and around the "first island chain," from Japan to the Ryukyu Islands to Taiwan to the Philippines to Borneo. Thus, the Chinese navy is now responsible for the Yellow Sea, East China Sea, and South China Sea, as well as areas adjacent to the outer rims of that chain of islands.

The new strategy has carried new missions. Instead of simply supporting the army's land operations, the navy is to focus on reunification with Taiwan, maritime territorial disputes, securing sea lines of communication, and deterring or defending against enemy attack from the sea. Following the 1995–1996 Taiwan Strait Crisis, China became mainly focused on potential Taiwan scenarios, such

as a blockade or invasion of the island and countering U.S. intervention in a cross-strait conflict.

Today, the Chinese navy appears to be moving toward a new strategy of “far-seas operations,” with responsibilities extending out to the “second island chain” running from northern Japan to the Northern Mariana Islands to Guam. The increased responsibilities follow “New Historic Missions” and “Diversified Military Tasks” of the Chinese military, which Hu Jintao advocated in 2004. These new concepts require the military not only to enhance its combat capabilities but also to respond to nontraditional security challenges by participating in “non-war military operations.”

According to the data of the U.S. Office of Naval Intelligence, by 2009, China had deployed 74 destroyers and frigates, 53 diesel submarines and 6 nuclear-powered attack submarines, 58 medium and large amphibious ships, and more than 80 missile patrol boats. The U.S. Department of Defense estimates that the percentage of modern units within China’s submarine forces has increased from less than 10% in 2000 and 2004 to 50% in 2009 and that the percentage of modern units within China’s force of surface combatants has increased from less than 10% in 2000 and 2004 to about 25% in 2008 and 2009. Transforming from large numbers of low-capability, single-mission platforms to a smaller force of highly capable, multimission systems, China has now the largest navy in Asia. In December 2010, China officially admitted that it has embarked on an aircraft carrier-building program, which could be used for power projection operations as well as those in Taiwan-related conflict scenarios.

In line with China’s evolving strategy and its growing capabilities, Chinese navy ships have begun to conduct operations away from China’s home waters. In November 2004, a *Han*-class SSN (nuclear powered attack submarine) was detected in Japanese territorial waters near Okinawa after traveling far into the western Pacific Ocean. In October 2006, a *Song*-class SS (attack submarine) reportedly surfaced 5 miles away from U.S. Navy aircraft carrier *Kitty Hawk*, which reportedly was operating in international waters in the East China Sea, near Okinawa. In December 2008, China deployed two destroyers and a support ship to waters off Somalia to conduct antipiracy operations. In March 2010, Chinese navy ships involved in China’s antipiracy

operations entered the Persian Gulf. In April 2010, a group of about 10 Chinese ships, reportedly including two *Sovremenny*-class destroyers, three frigates, and two *Kilo*-class attack submarines, transited Japan’s Miyako Strait on their way to and from antisubmarine warfare exercises in the western Pacific. At that time, Chinese helicopters flew close to Japanese destroyers that were sent to the area to observe the Chinese ships, prompting a protest from Japan.

Tension Between India and Pakistan

Relations between India and Pakistan have been marked by cycles of alternating periods of crisis and normalization. Both countries fought three conventional wars in 1947–1948, 1965, and 1971 during the Cold War era. The tension and bitter rivalry between India and Pakistan were rooted largely in competing claims to the Kashmir region. While the end of the Cold War did little to unravel this strained bilateral relationship, the possession of nuclear weapons provided the two countries with the opportunities to develop a slow but steady peace process.

The nuclear tests by India and Pakistan in 1998 appeared to trigger both escalation of tensions and creation of confidence-building measures. In February 1999, India and Pakistan announced the Lahore Declaration to reduce the risk of accidental use of nuclear weapons and discuss concepts and doctrines for confidence building in the nuclear and conventional fields. However, in May 1999, Pakistani army forces crossed the Line of Control, which separates Pakistan-occupied Kashmir from the Indian side, and occupied a mountain edge near the town of Kargil. After 2 months of fighting, the estimated number of total casualties on both sides varied from 1,200 to 2,000.

While levels of violence in Kashmir declined significantly from the 1990s, when they were at their peak, the situation became much more complex after the September 11, 2001, terrorist attacks on the United States. India used the opportunity to appeal to the international community to highlight the fact that the Kashmir issue was one of terrorism and India was its victim. Although India sought to isolate Pakistan by offering air bases and other logistical support to the U.S. military, the United States attached importance to Pakistan’s geographical

advantage and its close ties to the Taliban. As a result, the fact that the United States became a strategic partner with India and a key ally in the Global War on Terrorism with Pakistan contributed to the Indian-Pakistani rapprochement.

The December 2001 militant attack by Pakistani-backed terrorists on the Indian Parliament triggered a major crisis that stopped short of war, including a tense stand-off for several months involving more than half a million troops. Following this event, all lines of communication were almost shut down. However, in November 2003, Indian and Pakistani armed forces began a cease-fire at the Line of Control, ending 14 years of virtually daily artillery exchanges. In June 2004, India and Pakistan finally resumed a bilateral composite dialogue to bring about “peaceful settlement of all bilateral issues.” Despite the large-scale terrorist attack on Mumbai, India, in November 2008 that left some 165 civilians dead, the bilateral peace process was getting back on track in 2010.

Terrorism in India, the Philippines, and Indonesia

Since the September 11 attacks in the United States, South and Southeast Asia have experienced an upsurge in terrorist violence, the situation in Southeast Asia being less severe than in South Asia. In South Asia, many Islamist groups operate across national borders and have ties with international terrorist organizations. On the other hand, in Southeast Asia, regional affiliations among radical Islamists have become less significant as their capabilities have diminished since 2005 owing to successful security operations by the armed forces and national police. In general, connections between Islamic extremism and terrorist organizations in South Asia are more extensive than they are in Southeast Asia.

More than 60% of Muslims in the world live in Asia, while less than 30% of the population of Asia is Muslim. There exists much diversity in the ethnic backgrounds and the practices of Islam. Islam in Southeast Asia is relatively more moderate than in South Asia. In addition, Islamic radicals in Southeast Asia focus more on the political aspects of jihad, with strong local roots and separatist goals, than on the religious and tactical aspects. This section takes

up the cases of India, the Philippines, and Indonesia as regional hotspots of terrorist activity.

India

In 1989, an ethno-religious insurgency erupted in Indian-controlled Kashmir. The Jammu and Kashmir Liberation Front, an indigenous organization, was initially at the forefront of this movement. Several anti-India militant groups fighting in Kashmir are based in Pakistan and are closely linked to Islamist groups there. Many also are said to maintain ties with international jihadi organizations, including al Qaeda. The following terrorist outfits are most often blamed for terrorism in India: Lashkar-e-Taiba (LeT), Jaish-e-Mohammed (JeM), Harakat ul-Mujahideen, and Hizbul Mujahideen.

JeM claimed responsibility for an October 2001 suicide bomb attack on the Jammu and Kashmir state assembly building in Srinagar, which killed 31 people. LeT has been linked to numerous terrorist attacks in India, including bombings in New Delhi in 2005, bombings in Varanasi and Mumbai in 2006, and the terror assault at the financial hub of Mumbai in 2008. Pakistan's support for a host of Kashmiri insurgent and terrorist groups has fundamentally transformed the indigenous features of the Kashmir insurgency and rendered it almost intractable.

Many separatist groups in India's northeastern states have been implicated in lethal attacks on civilians and have been designated as terrorist organizations by India under the 2002 Prevention of Terrorism Act. More than 6,000 people, one third of them insurgents, are estimated to have been killed since 1992 in related violence in the states of Nagaland, Assam, Manipur, and Tripura. Among the dozens of insurgent groups active in the northeast are the United Liberation Front of Assam, the Nationalist Social Council of Nagaland, the National Liberation Front of Tripura, the National Democratic Front of Bodoland, and the United National Liberation Front.

There also exist communist insurgent “Naxalites” in India. They have engaged in violent struggle on behalf of the landless poor and the tribal people and lower castes. These groups, most active in inland areas of east-central India, claim to be battling oppression and exploitation to create a classless society. Most notable of India's Maoist groups

are the People's War Group, mainly active in the southern state of Andhra Pradesh, and the Maoist Communist Center of West Bengal and Bihar. In September 2004, the two groups aligned to form the Communist Party of India (Maoist).

The Philippines

The southern Philippines have long been a sanctuary and training and recruiting ground for terrorist organizations. Militant organizations like the Abu Sayyaf Group (ASG) and the Moro Islamic Liberation Front (MILF) operate in the Sulu archipelago and the easternmost island of Mindanao.

The ASG, formed in the early 1990s, has a record of killings and kidnappings and has had links with al Qaeda. The ASG's armed strength has declined from an estimated 1,000 to about 400 through U.S.-supported Philippine military operations since 2002. The ASG has ties with military factions of the MILF and Jemaah Islamiyah (JI). Since 2003, the ASG has carried out bombings and plotted bombings in cooperation with JI and the MILF, including bombings in Manila.

The MILF was formally established in 1984. With an estimated armed strength of 10,000 to 12,000, it has aimed at separation and independence for the Muslim region of the southern Philippines. There were strong links between some elements of the MILF and JI, including the training of JI terrorists in MILF camps and the planning of terrorist operations. The MILF and the Philippine government reached cease-fire agreements in 1997 and in 2003. In August 2008, the Philippine government and the MILF signed a Memorandum of Agreement laying out a framework for a settlement to end the MILF insurgency and recognizing the ancestral domain of Filipino Muslims. Renewed fighting between the government and the MILF broke out following the collapse of the accord, reportedly resulting in the displacement of more than 600,000 villagers and dozens of deaths. The government and the MILF managed to negotiate a new cease-fire agreement in July 2009. They also agreed in September 2009 on a new round of peace negotiations that would include the establishment of an International Contact Group.

Indonesia

Since the end of the Suharto regime in May 1998, terrorism has been the most serious issue in

Indonesia. Although a Muslim majority practices religious tolerance and democracy, radical groups have grown in influence by taking advantage of the country's internal problems, such as separatist movements, a severe economic recession after the Asian financial crisis, and the Muslim-Christian strife in the country's remote regions.

Until the conclusion of the 2005 peace accord, the Free Aceh Movement was the most active, taking responsibility for terrorist attacks in Indonesia. With the dissolution of the Free Aceh Movement, the Front Pembela Islam (Islamic Defenders Front), formed in 1998, was disbanded in 2002. The Laskar Jihad, formed in 2000, was also dissolved in 2002. Replacing those militant groups as the leading perpetrator of fatal terrorism was a group of JI in cooperation with al Qaeda. Since 2003, the major bombings have been carried out by a splinter group led by Noordin Mohammed Top.

Following bomb blasts in several cities on Christmas Eve, 2000, the 2002 Bali bombing, the most deadly terrorist attack since the September 11, 2001, killed approximately 200 and injured some 300, mainly Australians and Indonesians. Other bombings on such soft targets include the bombing of the Marriott Hotel in Jakarta in August 2003, the bombing of the Australian embassy in September 2004, and the second Bali bombing of October 2005. In July 2009, the near-simultaneous bombings of the J. W. Marriott and Ritz-Carlton hotels in Jakarta killed 9 and injured more than 50, including 6 Americans.

The 2002 Bali bombing convinced the Indonesian government to reverse its previous reluctance to investigate JI. Since the presidential election of Susilo Bambang Yudhoyono in 2004, the Indonesian government became both more assertive and more effective in its counterterrorist activities. Although Abu Bakar Ba'asyir, the leader of JI, was sentenced in April 2004 to 30 months' imprisonment for conspiracy in the 2002 Bali bombings, he was released in June 2006. In September 2008, many JI members reportedly joined Abu Bakar Ba'asyir's new organization, Jamaah Ansharud Tauhid, while Noordin Mohammed Top was reportedly killed during a raid by Indonesian police in September 2009.

Future Prospect of Asia

It is not easy to address long-standing conflicts like the ones of the Korean Peninsula, the Taiwan Strait,

the South China Sea, and India-Pakistan. In addition, transnational security challenges such as terrorism, piracy, as well as the trafficking of drugs and arms would continue to feed threats without effective international cooperation. Among the many challenges lying ahead and many problems confronting the region, the most critical factor in future Asian security is China's rapid rise in the international arena.

The growing power of China may not only impose direct threats to neighboring countries but may also leave the United States and its allies less well positioned to deal with the sensitive issues on the Korean Peninsula, the Taiwan Strait, and the South China Sea. Above all, it would inevitably change the basic structure of the regional system as well as the security order in Asia. Under the current uni-multipolar structure with one superpower (the United States) and four major powers (China, India, Japan, Russia), regional order in Asia has been maintained in an imperfect manner by the two aspects of hegemonic power and balance of power.

However, China had already surpassed Japan in 2011 and could reportedly reach the biggest economy, the United States, in the 2030s. India would catch up with Japan by 2030 and the United States by 2050. As a result of these dramatic power transitions, the U.S. hegemonic system would further erode, on the one hand, and the balance-of-power system among five powers, including the United States, would begin to operate, on the other hand.

As far as a significant power gap exists, China has reluctantly accepted the U.S. hegemonic system, even though it has expressed the desirability of multipolarization in the future. However, following the power transitions, China will begin to challenge the legitimacy of the U.S. military presence and then shift the assessment of its function from stabilizer to potential threat to U.S. national interests as well as regional security. In addition, uncertainty and miscalculations in the balance-of-power system are likely to be the sources of danger that cause security issues among major powers as long as cooperative regionwide institutions for enhancing transparency remain underdeveloped in Asia.

ASIAN AMERICANS

As long as there have been Asians in America, they have participated in the U.S. military. Though few details are available about individual Asians, it is evident that as a group Asians had particular experiences that colored their association with the military. This entry examines the history of Asians and Asian Americans in the U.S. military and provides details on some of the more eminent individuals and units in the military.

Racial politics and international relations were decisive factors in shaping their involvement—from enlistment in the military to the conditions of service in it. During the latter half of the 19th century, an anti-Asian movement gave rise to a host of laws that essentially excluded Asians from the country and discriminated against those already here. As a result of restrictive immigration laws and the anti-miscegenation laws that were enacted to address the supposed “threat” that they posed to the livelihood

of White workers and the White racial character of the country, few Asians and Asian Americans were available for military service. Antipathy toward them persisted into the 20th century, when the country felt threatened by or became embroiled in wars with various Asian nations. At times, Asian and Asian American residents were seen as a national security problem and a source of social instability.

Early Military Service

The first known instance of Asian involvement with the U.S. military dates back to the War of 1812, sometimes called the Second War of Independence against England. “Manilamen,” Filipinos who had settled in Louisiana, signed up with the buccaneer Jean Lafitte to assist Andrew Jackson in the Battle of New Orleans (1815). Asians also participated in the American Civil War. More than 50 Chinese Americans fought on both sides of the conflict, including John Tomney, who served in one of the New York infantry regiments and eventually died of wounds sustained at the Battle of Gettysburg.

At the end of the century, during the Spanish-American War (1898), there were Japanese Americans serving in the U.S. Navy at the Battle of Manila Bay and Asian Indians in the U.S. Army. Some of the Asian Indians who had migrated from the west coast to Colorado, for example, volunteered for the 1st Colorado Regiment, U.S.V. (United States Volunteer), to fight in that conflict and the Philippine-American War (1899–1902). During the Philippine-American War, significant numbers of Filipinos joined the U.S. Navy and the Philippine Scouts, a military organization within the U.S. Army, founded in 1901. Because of the navy’s discriminatory policies, Filipinos (and later, Chinese) were eligible to enlist only as mess stewards. However, as soldiers in the Philippine Scouts, they were assigned the arduous task of suppressing Emilio Aguinaldo’s revolutionary forces, which had emerged in the wake of the collapse of the First Philippine Republic, and subduing the fierce Moro tribes on the island of Mindanao. In the campaign against the Moros, Private José B. Nisperos of the 34th Company was awarded the Medal of Honor for protecting his unit from annihilation.

In the course of General John J. Pershing’s failed Mexican Expedition (1916–1917) to capture the Mexican revolutionary leader Pancho Villa,

Mexican Chinese provided his forces with various goods and services. To protect them from retaliation, Pershing brought 527 of them back to the United States in contravention of the Chinese Exclusion Act (1882), which barred them from entering the country. Most of “Pershing’s Chinese” settled in San Antonio, Texas. Since Asians and Asian Americans were stereotyped as suitable only for manual labor, the government employed many of Pershing’s Chinese as auxiliary workers—laborers, carpenters, cooks, and blacksmiths—to support the army while it prepared for World War I. In the Great War itself, Asians and Asian Americans were conscripted as “non-Whites” into the National Army, where they were also assigned auxiliary work. But a few of them did see combat: Private Tomás Claudio, a Filipino American, was one of the marines to die at the Battle of Chateau-Thierry, and Sergeant-Major Tokutaro Nishimura Slocum, a Japanese American, fought with the 328th Infantry Regiment, 82nd Infantry Division (nicknamed the All-American Division).

World War II Service

During World War II, Asians and Asian Americans were integrated into regular units or served in segregated units commanded mainly by White officers. As non-White members of regular units, they were usually relegated to menial tasks rather than given combat missions; as members of segregated units, they were stigmatized and disparaged. Racial discrimination notwithstanding, they acquitted themselves well in the war. For some Asians, an important motivation was to aid their ancestral homelands against Axis aggression as well as affirm their claim to America as their adopted homeland. It was because of their sense of obligation to country and family that Asians and Asian Americans distinguished themselves in the war, winning numerous awards. For all of them, World War II was a watershed event that had important implications for their struggle for civil rights in America. Veterans returned home with a newfound confidence that they could overcome the racial barriers that had previously prevented them from advancing in American society.

Among segregated units, the previously mentioned Philippine Scouts was the largest and most experienced. As part of the U.S. Army’s Philippine Division, the Philippine Scouts constituted over half of General Douglas MacArthur’s U.S. Army forces

in the Far East. In the beginning of the Pacific War, the Philippine Scouts were America's frontline soldiers and were considered the mainstay at the Battle of Bataan. One of the first Medals of Honor was awarded to Sergeant José Calugas, a Philippine Scout, who later received a direct commission in the U.S. Army. He was among those who survived the infamous "Bataan Death March," which had resulted in an estimated 5,000–10,000 Filipino deaths. Afterward, he led a guerrilla unit against Japanese occupation forces. Meanwhile, on the other side of the world, another Filipino American would also be awarded the Medal of Honor, though belatedly. Staff Sergeant Rudolph B. Davila, 7th Infantry Regiment, 3rd Infantry Division, initially received the Distinguished Service Cross (DSC) for leading his men against enemy machine gun emplacements in an offensive near Aetna, Italy. In 2000, his DSC was upgraded to the Medal of Honor. He was the only Filipino American to receive the Medal of Honor in the European theater.

Approximately 250,000 Filipinos served with the United States military during World War II. They did so, however, as U.S. nationals rather than as citizens because the Philippines was still a territory in America's overseas empire. Against President Harry Truman's objections, Congress passed the Rescission Act (1946), denying them the veteran benefits that they were originally promised despite their service and sacrifice. After more than 60 years of effort, the Filipino veterans movement succeeded in recovering partial payment through a provision included in the stimulus bill that President Barack H. Obama signed into law in 2009.

Like the Filipinos, Chinese and Chinese Americans served alongside and in the American armed forces during World War II, beginning with those who served in the Chinese-American Composite Wing. The Chinese-American Composite Wing included the famous "Flying Tigers" or American Volunteer Group, which later became part of the U.S. 14th Air Force. The U.S. 14th Air Force also included the segregated all-Chinese American 14th Air Service Group (ASG). The 14th ASG was expressly organized for duty in the China-Burma-India Theater, which the Allied leaders originally thought would become a major area of operations against Japan. Besides providing support services to the air force, the 14th ASG had the additional assignment of performing liaison work between the American and Chinese

troops. About 10% of all Chinese Americans in the armed forces served in the 14th ASG.

Besides the Chinese Americans serving in the segregated 14th ASG, others trained as pilots and aircrew. Among the aviators was Hazel Ying Lee, the first Asian American woman to fly for the U.S. military as a member of the Women Airforce Service Pilots. She ferried fighter planes for the military and died in the line of duty. (At about the same time, her brother Victor was killed in combat in France.) In 1977, Hazel Ying Lee and other Women Airforce Service Pilots belatedly received recognition for their wartime service and were accorded full military status.

However, the majority of Chinese and Chinese Americans in uniform were either integrated into regular army units that fought in the European and Pacific theaters or served aboard naval vessels mainly as mess stewards. The most eminent was Captain Francis Wai of the 34th Infantry Regiment, 24th Infantry Division, one of the few Asian American officers allowed to serve in combat. He was posthumously awarded the Distinguished Service Cross for leading his men against enemy gun emplacements on Leyte, Philippines. In 2000, his award was upgraded to the Medal of Honor. To date, he is the only Chinese American to have received the nation's highest military award. Altogether approximately 15,000–20,000 Chinese Americans or 19% to 25% of the Chinese American community served in the armed forces during World War II.

America's Finest

The most acclaimed segregated Asian American military units were the Japanese American 100th Infantry Battalion (nicknamed "The Purple Heart Battalion" for the casualties it sustained) and the 442nd Regimental Combat Team (RCT). Because America was at war with Japan, these soldiers had the additional burden of proving their loyalty to America. Immediately after the preemptive strike at Pearl Harbor on December 7, 1941, Japanese Americans (most of whom were *nisei*, second-generation Japanese born in the United States) were initially classified as 4C, "enemy aliens," who were unacceptable for military service because of their nationality or ancestry. On February 19, 1942, President Franklin D. Roosevelt signed Executive Order 9066, empowering military authorities to

forcibly remove people of Japanese ancestry from the west coast on the spurious rationale of “military necessity” and incarcerate them in concentration camps. Historians regard this as the worst mass civil rights violation in American history. Japanese Americans living in Hawaii were spared due to the impracticality of interning almost half of the local population and the consequent dislocation of the local economy that this would cause.

Because of personnel needs later in the war, the government reversed its decision about the ineligibility of Japanese Americans for military service. By the end of World War II, there were proportionately more Japanese Americans in the U.S. Army than in the general population. Most of them were members of the 100th Battalion, made up of mostly Hawaiian Japanese Americans, or the 442nd RCT, which included *nisei* recruited from the concentration camps. Ironically, they would be among the first to liberate Dachau, the oldest concentration camp in Germany.

During the North African campaign, the 100th Battalion was originally assigned to guard supply trains but was later allowed to engage in combat operations in the arduous Italian campaign, landing at Salerno and joining in the assault on Monte Cassino. One of its legendary officers was Captain Oak Young Kim, a Korean American. Among his exploits was the capture of two German soldiers who provided intelligence that contributed to the capture of Rome. Had they not been ordered to halt 10 miles from Rome, the men of the 100th would have been the first Americans to liberate the Italian capital. Later, the 100th and 442nd were merged. Together, they fought in Italy before being reassigned to the invasion of southern France. In France, the 442nd RCT famously broke through a reinforced German line of resistance to rescue the “Lost Battalion,” 211 men from the 141st (“Alamo”) Regiment, 36th (“Texas”) Division, after 4 days of grueling warfare in the rugged Vosges Mountains, in eastern France. In the process, the 442nd suffered heavy casualties, exceeding the number of men whom they had saved.

The 442nd RCT became the most decorated unit in U.S. military history for its size and length of service. In less than 2 years, it participated in seven major campaigns in Italy and France, received seven Presidential Unit Citations (five in a single month during combat in the Vosges), and its members received 18,143 awards, including an extraordinary

9,486 Purple Hearts, representing a casualty rate of 314%, and 52 Distinguished Service Crosses.

Initially, there had been only one Medal of Honor awarded to a Japanese American. It was presented posthumously to PFC (Private First Class) Sadao Munemori of the 100th Battalion for sacrificing himself for his men during combat near Seravezza, Italy. On June 21, 2000, acknowledging that there had been racial discrimination in the bestowing of decorations in World War II and using its established criteria for the conferring of medals, the army upgraded the awards of 20 Japanese Americans and two other Asian Americans (the aforementioned staff sergeant Rudolph B. Davila and Captain Francis B. Wai) to the Medal of Honor for risking their lives above and beyond the call of duty in action against the enemy. On October 5, 2010, President Barack H. Obama recognized the Japanese American World War II veterans as a group by awarding them the Congressional Gold Medal, the highest civilian award given to an individual or group for deeds or service to the United States.

Less well known than the storied soldiers of the 100th Battalion and 442nd RCT were the Japanese Americans who performed an indispensable role in the Pacific and the China-Burma-India theaters as members of the Military Intelligence Service, where they served as interpreters, translators, and interrogators, often accompanying combat units in the field. Their achievements included the translation of the “Z Plan,” which contained Japanese strategy in the Central Pacific, leading to allied victories in the Mariana Islands Campaign. According to General MacArthur’s chief of intelligence, Major General Charles Willoughby, the work of the Japanese Americans shortened the war by 2 years.

Post–World War II Service

Recognizing the contributions of Asians and Asian Americans as well as other people of color during World War II, President Harry S. Truman eliminated racial segregation within the armed forces in 1948. Only since then have they been integrated and accepted on anything like an equal basis into the U.S. military. Still, they continue to cope with issues of fairness and trust in the military. Asian Americans who participated in the Korean and Vietnam Wars have suffered from the additional burden of being viewed with suspicion because of their ethnicity,

risking harassment and worse. Toward the end of the 20th century, the circumstances of Asians and Asian Americans had improved as the country's changing demography had given rise to an increasingly multi-ethnic military force. But as the Bruce Yamashita case shows, the problem of racism persists. In 1989, after suffering racial harassment because he was a Japanese American, Yamashita was dismissed from Marine Corps Officers Candidate School. In 1993, however, he received his commission after it was learned that there had been a consistent pattern of discrimination against him and other minority candidates. His case led to various reforms prohibiting racial and ethnic discrimination in the military.

Unfortunately, the problem of racial and ethnic discrimination in the military persists into the 21st century. There have been several reported incidents of alleged verbal and physical abuse of Asian Americans who are serving their country overseas. One incident that has received widespread public attention is the tragic case of Private Danny Chen. While serving in Kandahar, Afghanistan, Chen was the victim of constant racial slurs and physical abuse because of his Asian ethnicity, eventually driving him to commit suicide on October 3, 2011. As of this writing, eight of his fellow soldiers have been charged with various crimes, including involuntary manslaughter, negligent homicide, reckless endangerment, and assault.

These problems notwithstanding, Asian Americans continue to distinguish themselves in the U.S. military, though in unforeseen ways. In the wars in Iraq and Afghanistan, several have achieved prominence through protest. General Eric Shinseki and Major General Antonio Taguba are the best known. In 1999, General Shinseki was the highest ranking Asian American in U.S. military history when he became the 34th Army Chief of Staff. In 2003, he publicly disagreed with Secretary of Defense Donald H. Rumsfeld during the planning of the Iraq War, arguing that many more troops would be needed for the postwar occupation than had been originally estimated. Shinseki was forced to resign as a result of this controversy. Later, he was vindicated when his assessment was found to be correct. In 2009, President Obama appointed him to head the U.S. Department of Veterans Affairs. In 2004, Major General Taguba was assigned to investigate reports of abuse of prisoners in Abu Ghraib prison in Iraq. His report was highly critical of the army's torturing

of prisoners in violation of the Geneva Conventions. In 2007, Taguba was forced to resign. In 2008, in a preface to a report by Physicians for Human Rights on the treatment of prisoners in Iraq and Afghanistan, Taguba accused President George W. Bush's administration of committing war crimes and called for the prosecution of those responsible. Both Shinseki and Taguba are men of integrity who were forced out of the military for adhering to the values expressed in West Point's motto, "Duty, Honor, Country."

Concluding Comments

Asians and Asian Americans have a long and honorable record of service in the U.S. military. Along with the usual suffering and deprivation that such service entails, they had to shoulder the burden of racism in the military. They risked their lives to defend the country that had disowned and discriminated against them. In demonstrating their loyalty to the country, they hoped to be accepted as legitimate members of it. For Asian immigrants, military service was a way to citizenship, overcoming the anachronistic Naturalization Act of 1790 that had limited citizenship through naturalization to "free White persons." For Asian Americans, military service was an affirmation of their citizenship and an expression of their civic responsibility. For Asians and Asian Americans, it was an assertion of their commitment to the U.S. Constitution and its ideals, with which they identified. Through their struggle and sacrifice, they proved the truth of President Roosevelt's words that "Americanism is not, and never was, a matter of race or ancestry."

William Wei

Author's Note: Asian Americans are Americans of Asian and Pacific Islander ancestry. Broadly speaking, the term encompasses any ethnic group that traces its origins to Asia and the Pacific. In the United States, however, Asian usually refers to East Asians such as Chinese, Japanese, and Koreans, as well as South Asians such as Asian Indians and Southeast Asians such as Filipinos and Vietnamese, to name the most well known. Pacific Islander is usually reserved for the indigenous natives of Hawaii, though technically the term includes inhabitants of Polynesia, Melanesia, and Micronesia.

ASSOCIATION OF THE UNITED STATES ARMY

The Association of the United States Army (AUSA) is a private, nonprofit educational organization that advocates for and supports all the components of the U.S. Army—the active force, the National Guard, the U.S. Army Reserve, the army’s civilian workforce, plus the family members and retirees of each component. This entry describes the mission and structure of AUSA.

Founded in 1950, the association’s focused mission is to represent the army by being the voice of all the members within its components, foster public support of the army’s role in national security, and provide professional, educational, and information programs. AUSA has 125 chapters

located worldwide. It is made up entirely of individual volunteers and corporate members who conduct programs and activities designed to engender community support for the army. The chapters are grouped in nine regions: seven within the United States, one in Europe, and one in the Pacific. Membership is open to everyone, not just army personnel, nor is membership mandatory for soldiers. Specifically, since its founding, AUSA membership has been and is open to members of all the army’s components plus its retirees, veterans, government civilians, businesspersons, industry representatives, military academy and Reserve Officers’ Training Corps cadets, family members, and concerned citizens. AUSA chapters have donated millions of dollars to meaningful support programs that include college tuition assistance, educational scholarships, and aid for wounded warriors and their families.

The organization’s central office, run by a paid administrative staff within 14 directorates, is located in Arlington, Virginia. It is governed by a council of trustees consisting of 21 members, many of whom are retired military veterans of senior rank, and advised by nine standing advisory committees. The advisory committees are Army Civilians, Awards, Chapter Operations, Finance and Audit, Noncommissioned Officer and Soldier Programs, Reserve Components, Resolutions, Retiree and Veterans Affairs, and Standing Bylaws. The association publishes on a monthly basis the *Army* magazine and the electronically delivered *AUSA News*. The magazine is devoted to the advancement of the military arts and sciences and to representing the interests of the U.S. Army and its components. Articles in the magazine range from the coverage of U.S. Army operations in areas of hostility and the conduct of humanitarian programs involving army personnel, to descriptions of current force equipment and how it is used, estimates of future force development, and pieces on the army’s history. The electronically delivered *AUSA News* disseminates via the Internet the latest developments within Washington, D.C., on Capitol Hill, and in the Pentagon that affect the army.

AUSA’s prime mission is to educate the public on the army’s values by telling the army story. The mission is specifically accomplished by the following:

- Conducting national issues conferences, forums, and special meetings
- Conducting monthly breakfast forums by AUSA’s Industry Affairs Directorate featuring prominent

The Association of the United States Army symbol.

army and Department of Defense military and civilian leaders

- Providing the U.S. Congress with testimony and visits to Capitol Hill through AUSA's Government Affairs Directorate
- Conducting an annual meeting in Washington, D.C., featuring exhibits of state-of-the art equipment, professional development seminars, and forums airing the latest issues affecting the army, its soldiers, civilians, and their families
- Articulating and supporting the interests of all army families through its Family Directorate

Fund-raising for the association via membership mailings and the conduct of programs is vested in its Institute for Land Warfare, which also prints and distributes free of charge periodic professional research papers, background briefs, and special reports. The Institute for Land Warfare extends the influence of the association by informing and educating its members, its leaders, and the American public on the critical nature of land forces and the importance of the U.S. Army. Reports such as "The Evolution of the U.S.-Japan Alliance," "A 21st Century Campus for Battle Command Training," "The Fiscal Year Army Budget: An Analysis," and "Reforming the National Security Council for the 21st Century: Integrating Homeland Security and Transnational Threats" can be ordered free of charge by e-mailing ILWPublications@ausa.org or calling 1-800-336-4570.

ASYMMETRIC WARFARE

Asymmetric warfare is a term that describes many conflicts in the post-Cold War era. Indeed, the period since the attacks on the United States on September 11, 2001, is sometimes called the "asymmetric warfare period." This type of warfare can be defined as any conflict in which one side with overwhelming military power tries to impose its will on a weaker enemy, while that weaker enemy tries to compensate

for its disadvantages, exploit the stronger adversary's vulnerabilities, and stop or disrupt the adversary's control. A simpler definition is an inferior power fighting a superior power as each side strives to exploit the other's disadvantages. In asymmetric conflicts, the weaker side is called an insurgency, and the stronger side's attempt to quell the insurgents is a counterinsurgency. This entry discusses examples of asymmetric warfare over the past century and provides details of recent and current asymmetric warfare in Iraq and Afghanistan.

Historical Background and Theories of Asymmetric Warfare

Although it has been a major focus of the Global War on Terrorism, asymmetric warfare predates 1989. Different names such as small wars, unconventional wars, or guerrilla wars have been used, but all share similar features. Among noteworthy historical examples were the American Indians of North America resisting Anglo-American expansion from the 1600 through the 1800s, the Boers resisting British imperialism in South Africa from 1899 to 1902, T. E. Lawrence and the Arabs contesting Turkish power in Palestine from 1916 to 1918, and the Viet Cong ejecting American military forces from South Vietnam between 1965 and 1973. These insurgents fought as guerrillas who ambushed their vulnerable enemies yet avoided pitched battles against vastly superior enemy forces. In each case, the supposedly superior Anglo-American, British, Turkish, and American forces endeavored to stop the insurgents from achieving their goals.

Anglo-American and British forces proved successful against Native American and Boer insurgents, in part because of the willingness of the Anglo-Americans and British to utilize extreme counterinsurgent measures like massacring Indian women and children in their villages and sending Boer women and children to concentration camps. Conversely, T. E. Lawrence and the Viet Cong succeeded in their goals by executing well-planned attacks against their Turkish and American enemies that reduced both material capabilities and combatant morale. The insurgent forces destroyed vehicles and killed and wounded service personnel. The other effective results of their attacks could be seen in diverting Turkish and American forces to react to insurgent attacks, arousing fears of insurgent ambushes, and

disrupting Turkish and American transportation. In the case of Vietnam, the televised images at home in the United States also magnified the detrimental effects of psychological defeats and setbacks. The Viet Cong exploited the negative publicity to speed the decline in civilian support for the American war effort and corresponding downturn in morale among American service personnel. These efforts can be seen as asymmetric from the perspective of the insurgents fighting a powerful adversary.

Insurgent forces draw on revolutionary beliefs, charismatic leadership, nationalistic fervor, religious zealotry, vengeful feelings, or other factors as motivations to engender fanatical support among some followers and passive support of the indigenous masses. The insurgents attempt to undermine their enemies' control with the goal of causing instability and inciting wider and wider rebellion or unrest. They utilize indirect means such as assassinations, suicide, or terrorist attacks that may have substantive or symbolic significance to their enemies and allies. These tactics minimize the cost in insurgent lives and maximize the effects of their attacks in the face of an overwhelming, yet slowly responding, foe. Thus, "asymmetric" fits as a label for such attacks of the weak against the strong.

The targeted nation-state or governmental authority strives to mitigate the disruptive effects of attacks. The counterinsurgency efforts may include relatively benevolent tactics like "winning hearts and minds," in which the nation or government works to maintain order and stability in nonmilitary ways such as improving communication or transportation infrastructure. Building roads, schools, and hospitals can, for example, provide proof that peace pays dividends for the populace, as opposed to the chaos and suffering caused by terrorist attacks. American occupation forces utilized this approach to one degree or another in the Philippines from 1899 to 1902 and in Haiti from 1915 to 1934. American efforts proved successful in the Philippines, where the indigenous masses gradually sided against the insurgents. However, building infrastructure and installing a centralized government in Haiti failed to ensure lasting stability when American forces withdrew. The nation fell back into its cycle of revolution and dictatorial rule that had existed before the Americans arrived in 1915.

Alternatively, if the nation or governmental authority ignores moral codes, counterinsurgency

could take the form of brutal retaliations, including incarceration, torture, or execution. In South Africa, in 1899, the Second Boer War erupted because British immigrants clashed with the Boer (farmers) already living there. The British army initially defeated the Boer rebels in conventional warfare but then fought a lengthy counterinsurgency against the stubborn Boer guerrilla fighters. To deprive the Boer insurgents of manpower and material support, the British rounded up their families and interned them in concentration camps. The internees suffered from starvation and disease at the hands of the British, and more than 10,000 died in captivity. By 1902, the atrocious British tactics took a toll on the Boers and brought them into negotiations. Other examples of vicious counterinsurgencies include the German army fighting against Yugoslav partisans in the Second World War and the Soviet army fighting against the Afghan mujahideen in the 1980s. In both cases, the occupation forces malevolently targeted the indigenous civilian population in reprisals against the insurgent forces.

Asymmetric Warfare After 2001

Since 2001, the terrorist tactics of nonstate actors (i.e., individuals or groups acting independently from any governments) like al Qaeda and governments like the Taliban have represented prime examples of asymmetric warfare. In the attacks on September 11, the nonstate terrorist group al Qaeda orchestrated a well-planned and expertly coordinated assault on American symbols of economic and military power. The terrorists drew on Islamic fanaticism and anti-American feelings. In killing some 3,000 unsuspecting people, the terrorists created fear and uncertainty among Americans, which they incorrectly hoped would leave the United States incapacitated and divided.

In the wake of the attacks in 2001, President George W. Bush initiated the Global War on Terrorism. The U.S. military sought to find and kill al Qaeda terrorists and eliminate the Taliban government in Afghanistan. Later, in 2003, Bush ordered an invasion of Iraq under the justification of stopping that nation's development of weapons of mass destruction and ending its aid to terrorist groups. American military forces quickly defeated the Iraqi forces and overthrew Saddam Hussein's regime, just as the American forces also easily defeated the

Taliban forces in Afghanistan and ejected the Taliban from power 2 years earlier, in 2001. In both Iraq and Afghanistan, however, American forces needed to kill the insurgents and rebuild the infrastructure of each nation.

From 2003 until 2007, American forces floundered in attempts to create a peaceful, democratic Iraq from the rubble of decades of dictatorship. Internal religious and ethnic divisions exacerbated these efforts. Not only were American forces contending with insurgent activities like suicide bombings and improvised explosive device attacks that represented the hallmarks of asymmetric warfare, but they also faced sectarian civil war among the competing Iraqi groups.

The initial American strategy sought to find and kill insurgents. Beginning in 2007, however, the American counterinsurgency strategy shifted in what has been called the “surge.” Several additional American units deployed to Iraq to increase security levels and to establish stable, productive, and peaceful economic and political systems. The surge’s new strategy, as espoused and followed by U.S. Army General David Petraeus, called for American troops to form close working relationships with Iraqis and gain their trust. American units began living with Iraqis and focused on protecting the civilian populace from insurgent attacks. Americans also worked side by side with Iraqi military forces and trained them in counterinsurgent techniques. These efforts proved successful in reducing both American and Iraqi casualties in the years since 2007. With the American military withdrawal from Iraq in 2011, it is unclear whether the government, military, and social structures established by 8 years of American occupation will remain intact in the long term.

In Afghanistan, however, neither the goal of killing insurgents nor that of rebuilding infrastructure has been completely achieved after more than a decade of military operations. American forces could not consistently bring superior firepower and technological superiority to bear against the insurgent fighters. Nor could they always utilize nonmilitary measures to end the insurgents’ influence among the Afghan people. For example, high unemployment and the opium trade represented two serious challenges in countering the Afghan insurgency. The al Qaeda and Taliban insurgents exploited unemployed Afghans, whose only options for income seemed to be fighting the Americans or working in the opium

trade. The insurgents offered cash prizes for successful attacks against American and Afghan government forces, and they utilized income from opium sales to fund their terrorist activities. Countering the economic realities required the United States to subsidize Afghan farmers so that they do not grow opium and provide alternative employment for the Afghan people. This goes straight to key concepts of asymmetric warfare. If it is not possible to kill insurgents, then it may be possible to deprive them of the indigenous and economic support necessary to maintain their operations. So asymmetry can be found in the techniques, tactics, and procedures of counterinsurgents and insurgents.

Other factors like length of conflict and numbers of casualties have helped extend the insurgent causes in Iraq and Afghanistan. For example, the higher the casualty rates, the longer the conflict and the less the American people support the Global War on Terrorism—or Overseas Contingency Operations, as it has been called by President Barack Obama since 2009. Al Qaeda, the Taliban, and other terrorist groups utilize various media to broadcast images of their acts, thereby undermining public support among Americans and inspiring anti-American sentiment around the globe. Every victory or defeat can be magnified by this psychological warfare in American military parlance.

In the future, asymmetric conflicts may be won or lost as much in binary code as they will be won or lost in the streets or on the airwaves. Terrorist and insurgent groups will increasingly target the computer networks of nation-states and government authorities. In so-called cyber warfare, a well-placed computer virus or a skilled hacker could bring governmental functions to a grinding halt by destroying or damaging digital infrastructure. The collapse of power grids, for example, could leave whole populations without electricity so necessary for survival. This in turn could make people vulnerable to the age-old insurgent objective of creating instability and fear to undermine faith in governments and the cohesion of social order.

ATTACHÉS, MILITARY

Military attachés, military officers assigned to a diplomatic mission, have become fundamental, if unheralded, members of embassies and consulates across the globe. Their missions run the gambit from diplomatic negotiations to the passive gathering of military intelligence. The mere assignment of a military attaché to a specific post signifies some type of foreign policy decision of a nation. Thus, military attachés may be assigned to capitals of friendly nations to strengthen military ties or posted to nations whose foreign policies may lead to confrontations. In both these instances, and the many cases that lay between, the military attaché is an asset, serving with the diplomatic corps overseas, a professional military officer trained to work within diplomatic circles. This entry discusses the history and mission of military attachés.

History of Military Attachés

The history of the military attaché system is somewhat misleading. While the initial use of military attachés as official organs of national foreign

policy, both in name and in mission, is traced back to the 19th century, military officers have been used to accompany diplomats into enemy and allied camps and territories since the Roman era (and probably well before) to gather and analyze information on foreign armies and their defensive/offensive capabilities. The more modern versions of the military attaché may have started as early as 1806, when Napoleon assigned army officers to foreign capitals to gather intelligence on their defenses and military preparations. While the military attaché position slowly became a fundamental position within embassies and consulates around the world, its progress can be charted in fitful increases during times of crisis and renewed international tensions and an understandable decline during times of relative peace or economic distress.

It should not be surprising then that in the 20th century, the number of military attachés serving in embassies and consulates throughout the world increased dramatically just before, during, and after World War II. By the late 1930s, nations had assigned military attachés to many of the major capitals of the world and even to important locations in the far-flung corners of the globe. Not only were more attachés assigned to more locations, but also the number of attachés assigned to individual embassies and consulates increased. With the rise of naval power and air power, the technical challenges of reporting on these new developments often overwhelmed a single military attaché. Thus, important locations, such as Berlin, had a head military attaché and several assistants as well. After World War II, the onset of the Cold War only increased the importance of having military attachés assigned to countries throughout the world by both sides to enhance intelligence collection and keep open channels with military leaders. From meager beginnings in the Napoleonic era to the creation of a vast military attaché system used by nearly every major power in the 20th century, the military attaché became an indispensable asset to key embassies and consulates throughout the world.

The Military Attaché's Mission

The primary mission of the military attaché is to provide a military officer at embassies and consulates throughout the globe to support a nation's diplomatic corps. Military attachés can facilitate talks between

their nation's military and the host nation's military, as well as maintaining friendly contacts within the armed forces of allies. Thus, the military attaché, through professional and social contacts, provides a line of communication that can prove invaluable to an alliance. Not only is the military attaché able to use these contacts to facilitate cooperation and joint adventures, but this also helps the attachés accomplish their intelligence-gathering mission.

Intelligence gathering is probably the most recognized and touted mission of the military attaché. Yet very rarely are military attachés assigned to overtly conduct intelligence-gathering missions. As an official member of the diplomatic mission serving in a host country, the military attaché is bound by the same rules and courtesies as the rest of the diplomats. Any violation of diplomatic agreements would quickly end in the host nation demanding the recall of the officer, or even more embarrassingly, the military attaché could be recalled by his or her own government. Thus, even though most people associate military attachés with spying, the fact is that they are closely scrutinized, both by their own diplomatic corps and by the host nation's counterintelligence services.

This does not mean that military attachés do not have an intelligence-gathering mission; they do, but they often work using passive measures. Intelligence can be gathered through monitoring newspapers, attending military maneuvers and demonstrations, or merely requesting and receiving permission to visit certain military facilities. In open democratic societies, all of these events can and have generated volumes of military intelligence, while in more closed societies, passive intelligence gathering tends to be less fruitful.

Military attachés have also been used in more active intelligence-gathering missions. But the nation assigning its military attachés to conduct such operations runs the risk of violating diplomatic and military agreements, with harmful consequences often far outweighing the usefulness of any intelligence gathered.

Conclusion

Military attachés fill a unique position at their assigned locations throughout the globe. They support the mission of the embassy or consulate by carrying out diplomatic missions, either through

military discussions with the host nation's military or by organizing and assisting in joint operations. These professional military officers also collect intelligence on the host nation and their neighbors through passive means, though on rare occasions, they also use more active measures. Thus, military attachés act in direct support of the diplomatic corps, as well as fulfilling a military mission. It is a balancing act as these professional officers work for two masters—their armed services and the diplomatic corps. It is a testament to their professionalism and service that they are unheralded members of embassies and consulates throughout the world, fulfilling their missions within the rules and regulations of their assignments.

ATTRITION WARFARE

Attrition is a style of warfare characterized by the effort to destroy an opponent's ability or means to resist. The primary goal of attrition warfare is to seek out and destroy the mass of the enemy's forces. Such an approach seeks to pit friendly strength against enemy strength and by this method destroy the enemy's capacity to fight. Forces employing attrition generally rely on mass to achieve this effect.

In the offense, attritionist forces measure success by the amount of ground they control, the number of enemy personnel that they have killed or captured, and the stocks of enemy equipment that have been seized or destroyed. In the defense, many of these same measures of effectiveness are still considered valuable. The goal of an attritionist force in the defense is to prevent enemy penetration. This entry discusses the history of attrition warfare and contrasts it with maneuver warfare.

Impact of the Industrial Revolution

Attrition warfare has been used, and has been effective, throughout history. The coming of the industrial age, permitting the mass production of weapons and ammunition, changed the scale on which attrition warfare could be conducted. Industrialization allowed massive amounts of artillery to subject the enemy to intensive preparatory fires prior to an assault by waves of infantry. The objective of the artillery bombardment was to annihilate enemy defenders or to impair their ability to resist effectively.

Such bombardments could last for hours, or even longer, and could consume quantities of ammunition inconceivable before the Industrial Revolution. For example, the British pre-assault bombardment against the Germans during the battle of the Somme, in France, in 1916 lasted for a week. This technique reached its zenith during the First World War and was encapsulated in the phrase “The artillery conquers, the infantry occupies.”

Artillery preparation of the objective was meant to substitute the weight of metal for the weight of numbers and prevent the wholesale slaughter of friendly soldiers during the assault. Defending soldiers adjusted by digging in ever deeper. As a result, no matter how long or heavy the bombardment, lengthy artillery preparation generally met with little success during the First World War. Even after the weeklong bombardment at the Somme, the assaulting British troops still suffered horrendous casualties at the hands of their German foes and achieved little in exchange for their losses.

By definition, attrition warfare requires that the force seeking to attrite its enemy must possess greater combat power than the force it is attempting to subdue. In addition, the attrition-style force must possess the means to carry on the fight. Due to the large logistical requirements and the potential for heavy casualties, attrition warfare places a great burden on a military force. Attrition warfare comes with other costs that transcend purely military considerations.

The ability to conduct attrition warfare also depends on national resolve and resources. Nations utilizing attrition warfare must have a civilian population willing to absorb potentially staggering casualties among its military forces in order to achieve victory. The industrial output required to sustain a

conflict of attrition may be great and may stress the economic capacity of the state. This is particularly true if the fighting is intense and protracted.

Attrition Warfare and Maneuver Warfare

Attrition warfare and its counterpart, maneuver warfare, are absolutes. Whereas attrition warfare seeks to wear down an enemy by the use of sheer numbers of personnel and materiel, maneuver warfare seeks to avoid the enemy's strengths and exploit the enemy's weaknesses. In practice, most military organizations exist somewhere along the continuum between these two poles. No force can be said to be purely maneuverist, nor are there any purely attritionist forces. While attritionist forces generally behave in a manner more consistent with attrition warfare, they may employ some aspects of maneuver warfare.

It is also possible for attrition and maneuver warfare to be utilized concurrently by different commanders within the same military force or even by the same commander at different levels of war. The Soviet Army in World War II is often cited as an example of an attrition-style force. During 1944–1945, however, while still predominantly employing attrition at the tactical level due to their overwhelming numerical and materiel superiority over their German opponents, the Soviets utilized maneuver warfare brilliantly at the operational level. Through this combination, the Soviets rapidly reconquered the territory lost to the *Wehrmacht*—as Germany's armed forces were known from 1935 to 1945—in the early stages of the war and drove on to seize Berlin.

Characteristics and Culture of Attrition-Style Forces

In combat, the goal of attritionist forces is to effectively synchronize diverse units and effects in order to bring to bear on the enemy the maximum possible destructive capability. Careful synchronization and detailed orders to subordinates also help minimize the potential for “friendly fire” incidents. Synchronization is an effort to impose order on the chaos of the battlefield. A high degree of synchronization can only be achieved through centralized control.

The role of subordinate leaders and units is not to upset the plan painstakingly crafted by their higher headquarters. Attrition warfare requires subordinates who are obedient to orders. Subordinates are

expected to do as they are told, regardless of whether or not they agree. Subordinates who take initiative and act without orders can disrupt the carefully synchronized plans developed by higher headquarters. Such disruptions are to be avoided.

Forces that employ attrition generally possess a military culture that facilitates this style of war. The primary characteristics of forces employing attrition warfare are rigidly hierarchical command structures in which information flows up and decisions flow down; an inward focus on process, inputs, and procedures; and a system that values imposed discipline rather than self-discipline.

Synchronization of effects and efforts to exert control over battlefield events occurs at the highest levels of the military organization and generally results in a rigid and stratified chain of command. This hierarchy allows leaders at the top of the organization to receive information that flows up the chain of command, make decisions that will effectively synchronize efforts across the force, and disseminate decisions for execution. This decision-making process often results in rigid battle plans. Given the requirement for information to reach decision makers and be processed, and for orders to flow back to executors, actions can occur relatively slowly. This centralized system of command and control allows leaders at every level to maintain control of their subordinates' actions.

One method for speeding up the transmission of information up the chain of command and expediting orders down is through clearly defined processes. Forces utilizing attrition usually focus inward on the processes that facilitate the effective use of firepower. This commitment to process extends into virtually all facets of an attrition force.

Training methods reflect this focus on processes, with subordinate units mastering a relatively small number of drills to be applied in a multitude of situations. Leaders are judged primarily on how proficient their unit is in conducting these drills. The result is that personnel are trained with the goal of making them virtually interchangeable; they are essentially parts in a machine.

Attrition-style forces often rely on imposed discipline to encourage desired behaviors. Individuals who are treated as mere functionaries, regardless of individual talents or skills, do not often exert their best efforts. As a result, an attritionist system must

prescribe precise standards for virtually every situation. When these standards are violated, discipline results in an effort to correct the offender and as a warning to others.

Vietnam: A Recent Example

During the Vietnam War, the U.S. military was faced with a situation for which it was largely unprepared. Vietnam was in the throes of a civil war and was facing an insurgency backed by conventional forces from communist North Vietnam. Lacking experience in counterinsurgency, the U.S. military utilized an attrition strategy in an attempt to wear down the North Vietnamese Army and their Viet Cong allies. The U.S. forces conducted search-and-destroy missions during which, as John Prados argued in 2009, "troops entered enemy territory and laid waste to anything deemed valuable. They would also attempt to force a battle, holding the enemy in place while commanders marshaled the capabilities to annihilate them" (p. 137). The ultimate purpose of search-and-destroy missions was to inflict casualties on enemy forces faster than they could be replaced. Facilitating this effort, U.S. forces were able to call on an unprecedented weight of firepower in battle. While the North Vietnamese Army and Viet Cong did suffer tremendous losses, the rate of casualties never approached the level necessary to reach a "tipping point" at which North Vietnam would find the cost of the war unsustainable.

Current Thinking

Most modern, Western militaries have shifted their philosophy of warfighting away from attrition to a more maneuver-based style. There are a number of reasons for this. Most Western militaries are no longer composed of poorly educated conscripts able to do little more than follow commands; many modern forces are made up of relatively well-educated professional soldiers who are capable of more than blindly following orders. The higher quality and motivation of volunteers have enabled relatively junior soldiers to assume increased leadership roles when compared with their conscript counterparts.

Getting volunteers to join the military requires pay and incentives that are competitive with their potential civilian employers. When pay and benefits are coupled with the staggering sums spent to

recruit, equip, and train a modern force, the amount of money represented by any modern military is significant. In addition, these escalating costs have led to ever-smaller standing armies. Most nations have a large investment in their modern armies and do not wish to hazard their destruction unnecessarily. The cost of going to war is too great; in some cases, even victory could not balance the cost in lives.

Attrition warfare is not an attractive option for a smaller force that is facing a larger force. These smaller professional forces may face potential adversaries whose forces are much larger. As a result, the smaller professional forces began to search for a way to overcome their numerical disadvantage and still win. In many cases, a doctrine based on attrition warfare was displaced, at least in part, by one based on maneuver warfare. For many of the armies that adopted maneuver warfare, this process of change is still ongoing. In most cases, attrition warfare is entrenched in the doctrine, processes, and culture of the force. This is a change that will take many more years to be completed. Regardless, attrition warfare has been utilized throughout history and has been extremely effective. It will likely remain effective in the future. Attrition warfare is unlikely to disappear and is likely to be employed by forces with the means to do so.

Conclusion

Attrition warfare has proven successful throughout history, but this was not without cost. To effectively employ attrition, one must have more combat power than one's adversary. A nation must also create a force imbued with the military culture that is necessary for attrition warfare to be successful. One must be willing to pay the heavy cost in logistics or soldiers' lives that comes with success and the even higher costs that accompany defeat.

AUSTRALIA

Australia is a nation of 21,263,000 people located in the southwestern Pacific region and is a member of the Commonwealth of Nations and a pivotal ally of the United States in both regional and international affairs. Australian military and foreign policy in the 20th century has been intimately tied to its relationship with both Great Britain and the United States. This entry describes the government and political parties of Australia and discusses Australian military forces, alliances, and policies and the historical development of Australian military and foreign policy.

Government, Politics, and Foreign Policy

Australia's government blends elements of the British parliamentary system with the American federal division of powers between states and the central government. The formal head of state is Queen Elizabeth II, whose personal representative is the governor-general, who generally maintains a distance from the day-to-day workings of the Australian government. The one notable exception was the 1975 dismissal by the governor-general of the government of Prime Minister Gough Whitlam, which caused a constitutional crisis in Australian political life. The government is divided into three branches. Parliament, made up of the Senate and House of Representatives, forms the legislative branch. The executive branch is represented by the Federal Executive Council, made up of the governor-general and state governors

advised by the prime minister. The judicial arm of the government is the High Court of Australia. Two major political parties exist in Australia today. The Labor Party, the oldest established political party in Australia, is generally considered center-left on the political spectrum. The other party is a coalition of two center-right groups, the Liberal Party and the National Party. Traditionally, Labor has been the strongest of the political parties in Australia. The current prime minister is Julia Gillard, the first female prime minister in Australian history, who came to power in June 2010 replacing her Labor colleague Kevin Rudd after an internal power struggle within the Labor Party.

Australian foreign policy is generally guided by a strong commitment to multilateralism and a focus on Pacific and Asian affairs. Australia has traditionally viewed itself as the leading voice of British Commonwealth affairs in the region and has sought to stake out a place in the region as a leading power. Leading issues of concern for Australian foreign policy include free trade, economic cooperation among Pacific and Asian states, and support for the United Nations and its role in mediating international affairs. Since the UN's inception in 1945, Australia has viewed it as one of the central supports for extending its influence globally, primarily through the use of Australian military forces in peacekeeping missions in the Pacific region as well as elsewhere.

Military Forces

The Australian military forces are referred to jointly as the Australian Defense Force (ADF). The ADF is made up of the Royal Australian Navy, the Australian Army, and the Royal Australian Air Force. The integrated structure of the Australian military mirrors the American model of the Department of Defense to some degree, but Australian military forces have achieved a higher degree of integration through the ADF with its single chain of command. Australian military personnel number 59,023 active personnel with an additional 21,850 personnel in reserve forces, making it the largest in Oceania. The 2011 Australian military budget amounted to A\$26.5 billion, which equated to 1.8% of Australia's GDP for the 2011–2012 fiscal year. Prior to the late 1970s, Australian military doctrine focused on the idea of forward defense. This doctrine called for close

cooperation with major allied powers such as the United States and Great Britain to thwart potential threats to Australia at as great a distance as possible. This doctrine changed in the 1980s with a shift to emphasizing the need to be a self-reliant military force, with the primary emphasis being the protection of the northern maritime approaches to Australia. Since the late 1980s, Australian military policy has focused primarily on the application of Australian military power in support of UN peacekeeping missions, notably in Somalia in 1993, Rwanda in 1994, and East Timor in 1999.

Recent Australian military policy was outlined in the 2009 white paper *Australia in the Asia Pacific Century: Force 2030*, which places the greatest emphasis for Australian military policy on meeting direct threats to Australia's security, followed by the need for stability in the southwest Pacific area. To meet these goals, the white paper stated that the ADF must be capable of dominating the naval and air approaches to Australia while also being able to project Australian military power in the region in terms of humanitarian and peacekeeping missions. To ensure this goal, the Australian government has committed itself to an overhaul of the military equipment available to the ADF as well as an expansion of the Royal Australian Navy and Royal Australian Air Force.

Independence to World War II

Australia achieved full independent status on January 1, 1901, when it became a fully federated state. Throughout the first few decades of its existence, Australia continued to rely heavily on the British government for representation with foreign governments as well as for continued protection by the Royal Navy. Australian involvement in Europe during World War I was central to establishing an Australian sense of national identity. Key to this was the Australian experience during the Gallipoli campaign (April 1915–January 1916), when the Australians' faith in their relationship with the British was shaken due to perceived incompetence on the part of British planners and commanders and what was considered the undue sacrifice of Australian soldiers at Gallipoli. In the interwar period, Australian-British relations continued to deteriorate as Australia sought a greater commitment from the British government for defense spending in the region, especially in light of the

growing potential threat of imperial Japan. A key stumbling block between the Australians and British was debate over the funding of the massive naval base at Singapore, designed to act as a deterrent to Japan. The Australians expected the British to foot the majority of the bill, but the British government was unwilling to carry the cost of such a massive project that would benefit nations such as Australia most directly. It was during this period that discussion emerged among Australian leaders of establishing a closer relationship with the United States to meet the security needs of Australia in the Pacific region.

World War II

The outbreak of World War II in the Pacific in December 1941 was a key moment in the development of Australia's relations with the British and the Americans. The Labour government of Prime Minister John Curtin purposefully set out to construct a closer relationship with the United States by establishing for the first time an independent Australian foreign service post in Washington, D.C., with Lord Richard Casey named as the first Australian ambassador to the United States in 1940. The fall of the Singapore naval base on February 15, 1942, led to a conscious decision by the Curtin government to look to the United States due to the British inability to meet Australian security demands in the Pacific. Disagreements between the two powers over the wartime use of Australian military forces under the command of American General Douglas MacArthur were an important element in what was often a tumultuous relationship. The end of the war in August 1945 brought new disagreements over the peace treaty with Japan. The Australians pushed for a harsh settlement with Japan that included trying the Japanese emperor Hirohito for war crimes and providing for heavy reparations payments for prisoners of war. The United States was determined to maintain the postwar reconstruction of Japan as a wholly American operation and worked to exclude Australia as much as possible from the peace process and occupation. Eventually, both sides compromised by allowing a small British Commonwealth Occupation Force, made up, primarily, of Australian troops, after the 1947 decision of the British to withdraw their troops for budgetary reasons, to be stationed in Kure Atoll and for the creation of the Allied Council for Japan, a four-member advisory board to General Douglas MacArthur, on which

the Commonwealth representative was Australian William MacMahon Ball.

The Cold War and After

In the aftermath of World War II, the emerging Cold War between the United States and Soviet Union led to a polarization of the world's nations. Australia found itself torn between its traditional Commonwealth relationship and its newfound alliance with the United States. Several key issues arose by 1953 that helped solidify the bond between the United States and Australia. Chief among these were the election of Robert Menzies in 1949 as Australian prime minister, the outbreak of war in Korea in 1950, and the signing of the ANZUS (Australia-New Zealand-United States Tripartite Agreement) Treaty in 1951, brought into effect in 1952. Menzies's election was primarily motivated by the strident anticommunist message he utilized during the election, including a promise to outlaw the Australian Communist Party, which he attempted to do in 1950. Australia's stature as an ally grew in 1950, when it became one of the first world powers to supply combat forces to help stymie the North Korean advance in the summer of 1950. The Australians provided both naval vessels as well as the 77th Fighter Squadron, stationed in Japan. Australian policymakers pushed hard to make sure that Australia would be among the first nations to answer U.S. president Harry Truman's call for ground troops for the UN effort in Korea. Australian troops formed a key component of the British Commonwealth Force that fought under the UN flag in Korea, with three battalions of Australian troops eventually seeing action. A formalized military alliance between the two powers was reached in 1952, signaling the fulfillment of a decade-long quest for a security commitment from the United States on the part of Australia. The formalization of the alliance under ANZUS helped make the relationship between the two powers the central aspect of each nation's foreign and military policies in the Pacific region. ANZUS would provide the rationale for Australian military involvement in the Vietnam War in support of American policies there and would supplant the Southeast Asia Treaty Organization after 1963 as the principal U.S. defensive alliance in the Pacific and Asia. Australia has continued to be a principal supporter of American foreign policy, dedicating troops and resources to the U.S.-led invasions of Afghanistan in 2001 and Iraq in 2003.

Recently, Australia and the United States have sought to reaffirm their long-standing military relationship. In November 2011, President Barack Obama and Prime Minister Julia Gillard signed an agreement that would expand the American military presence in the South China Sea region, utilizing Australia and Australian holdings as bases. The agreement allows for the stationing of 2,500 U.S. Marines at Darwin in northern Australia as well as the possible use of the Cocos Islands in the Indian Ocean to base U.S. Air Force and Navy air forces and unmanned drones. Analysts argue that this move toward a greater military state of cooperation has been primarily aimed at limiting the growth of Chinese military power in the south Pacific and Indian Ocean basin, something that both governments deny.

AVIATION, ARMY

Aviation was first used in combat in the United States during the American Civil War when officers in the Union and Confederate Armies recognized the advantages of adding a third dimension to the battlefield. From above, observers in balloons conducted reconnaissance. Into the 20th century, technological advances expanded the role of aviation to encompass

broader tactical and strategic objectives. By the end of World War II, the U.S. Army saw the potential of the helicopter and worked to incorporate it into warfighting doctrine. During the Vietnam War, the helicopter proved incredibly useful, and in 1983, the army established aviation as an independent branch, which allowed further development and professionalization of army aviators. Today, Army Aviation's global missions deliver a wide variety of capabilities with unmanned aircraft systems (UASs), fixed-wing service and reconnaissance aircraft, and the world's largest fleet of helicopters. This entry discusses the history, aircraft, and missions of the Army Aviation branch.

Early History

In 1861, President Abraham Lincoln was impressed with the intelligence-gathering possibilities of manned balloons and appointed Thaddeus Lowe as chief of Army Aeronautics. At the beginning of the Civil War, the Union and Confederate Armies experimented with balloon reconnaissance. The Union army also used balloons to gather geographical information to make better maps. Their efforts were limited, however, because of the precarious nature of the equipment, the frequent shoot downs, and the imprecision of intelligence because of the time it took information to reach the field commanders.

In 1898, the reconnaissance balloon made its reappearance in Cuba during the Spanish-American War. Although using balloons helped pinpoint the enemy, it also gave away friendly positions to Spanish artillery, which eventually shot the balloons down. For the next several years, the army did nothing more than maintain a few balloons.

World War I

By the time the United States declared war on Germany in April 1917, the Army's Aviation force consisted of only about 1,200 men, 250 aircraft, and five balloons; all of which fell under the Signal Corps, which was responsible for providing observation and courier services to the branches of the army. During the war, Aviation proved such a specific and worthy capability that the American Expeditionary Force commander, General John J. Pershing, separated Aviation from the Signal Corps and established the Air Service. Air Service units were attached to ground units and provided commanders with aerial

reconnaissance, real-time battlefield reports, and adjustments for field artillery. Other units were bombardment or pursuit units, whose job it was to attack enemy positions or shoot down rival aircraft. By the time the Armistice was signed, ground commanders grew accustomed to having Aviation assets under their command and wanted them to remain as part of their permanent force.

Postwar demobilization, an isolationist foreign policy, influential pacifists groups, and international arms limitations treaties kept the U.S. armed forces small during the years following World War I. Yet despite these factors, the 1920 National Defense Act established the army's Aviation units as a separate arm. The act also helped the Air Service organize and train officers and enlisted men in the tactical and technical aspects of combat aviation. In 1926, the Air Corps replaced the Air Service. Over the next several years, the Air Corps set records for flight endurance, and one of its pilots was the first to make a complete flight using nothing but cockpit instrument indicators. Despite these accomplishments, acquiring modern equipment and establishing aviation as a serious military capability did not come easy for the Air Corps. Brigadier General William Mitchell, a strong advocate and promoter of military aviation, was court-martialed in 1925 for accusing senior War Department officials of incompetency and treason because they refused to recognize aviation's potential. Although Mitchell's career ended in resignation, he influenced enough younger officers to continue advancing theories in tactical and strategic combat aviation.

The rise of international threats in the mid-1930s forced the U.S. government to increase the armed forces enlistment authorizations and funding for equipment and training. The ensuing growth spawned an army restructuring, and the Air Corps was redesignated the General Headquarters Air Force (GHQ) in 1935. The GHQ developed staffs and special departments that were dedicated to organizing aerial pursuit, bombardment, and observation units. The GHQ also built hard surface runways, established bombing and gunnery ranges, purchased modern bomb sights, and implemented better individual and collective training. Yet despite continual improvements in equipment and appropriations for additional aircraft, on the eve of World War II the army's Aviation arm was still much smaller and less sophisticated than most European air forces.

World War II

The U.S. Army entered World War II with the assumption that air power had more of a strategic than tactical role in warfare. Without the danger of the homeland suffering aerial bombardment, theories resided in the assumption that large bombers could intercept a naval threat while it was still at sea. Senior officers were overconfident in the invulnerability and accuracy of long-range bombers, which reflected their early emphasis on the strategic role of combat Aviation.

Early in the war, General George C. Marshall, the chief of staff of the army, authorized organic Aviation assets to Army Ground Force units. Ground commanders embraced the resource and found productive uses for the aircraft. The field artillery, in particular, used airplanes to spot and direct fires. Other units used aircraft for reconnaissance and courier services. As the war progressed, the capabilities of combat aircraft increased and the strategic and tactical value of bombers and fighters became complex and exclusive. By war's end, the gap between the different types of aircraft and their roles and ever-increasing capabilities prompted the creation of the U.S. Air Force. The creation of the air force in 1947 also formally established Army Aviation as a separate and unique entity in the U.S. military.

The Rift

In 1948, Secretary of Defense James Forrestal drafted the "Key West Agreement," which divided air assets between the air force, army, and navy. Experiences from World War II classified aerial warfare into three categories: (1) air superiority, (2) close air support, and (3) air interdiction. During its first years of existence, it was thought that the air force was capable of executing these missions fully. This theory limited the army's Aviation mission and equipment sets. In 1949, a Joint Army and Air Force regulation mandated that army fixed-wing and rotary-wing aircraft would not exceed 2,500 and 4,000 pounds, respectively. These weight limits were established to ensure that the services would not duplicate platform capabilities. In 1957, the Secretary of Defense increased the army's aircraft weight limits. Despite these increases, the army remained very limited in its ability to carry its own troops to the battlefield. These mandates, and other regulatory documents signed by the secretaries of defense in 1951 and 1956, prohibited the army from conducting close air support with army aircraft. Yet during this time, the

air force increasingly invested in multirole fighters, which diminished the service's ability to conduct its close air support mission for the army. By the 1970s, the army's efforts to provide its own air support produced a fleet of versatile and lethal helicopters.

The Rise of Vertical Lift

In 1938, the U.S. Congress authorized \$2 million for research and development of a rotary-wing aircraft. The legendary helicopter engineer and pilot Igor Sikorsky met the government's need with the X-R4 in 1942. The following year, 15 R4-A helicopters were delivered to the army. During World War II, the U.S. Army and Navy used the R4-B, R6-A, and the R5-A in the south Pacific to ferry replacements parts for aircraft "flying the Hump" between Burma and China. The versatility of the new aircraft was profound as several Liberty ships were modified to allow helicopter operations. These aircraft also served as downed pilot rescue and medical evacuation platforms.

During the mid-1950s, the Airmobility Division was established at Fort Benning, Georgia, to create doctrine, organization, and materiel requirements for airmobile operations. Also, during this time, successful experiments with helicopter gunnery expanded the role of rotary-wing aviation on the battlefield. Improved technology and a growing civil helicopter industry contributed greatly to the development of tactical theory and operating procedures. By the end of the decade, the army consolidated its many programs and initiated several boards to clearly define Army Aviation objectives and system requirements for aircraft manufacture.

In 1962, the army detailed its plans to develop units that relied on organic helicopters for maneuver, firepower, logistical support, and command and control. Key to these developments was the UH-1 Iroquois, also known as the Huey. The Huey fit the army's need for a light, tough, and versatile helicopter that could be outfitted for transport, a flying command and control center, or a weapons platform. In 1965, the Defense Department finally agreed that the army would have helicopters.

Korea and Vietnam

The first large-scale use of helicopters in combat by the U.S. military was in the Korean War. The use of helicopters eased the challenges posed by Korea's mountainous terrain. Most notable was the H-13, which served as a medical evacuation (MEDEVAC) and observation platform.

The Vietnam War solidified the helicopter's role in modern warfare. Without the helicopter, tactical and strategic objectives would have been much more difficult to achieve due to the country's underdeveloped infrastructure and mountainous terrain. Poor road networks and remote outposts made helicopter transportation and fire support invaluable to ground commanders. In November 1965, a battalion of the 1st Cavalry Division defeated almost 2,000 North Vietnamese troops in the Ia Drang Valley. This was the first major combat in which helicopters served in all aspects of the battle to include carrying troops to the battlefield, resupply, MEDEVAC, close air fire support, and postvictory withdraw. Yet it was not the challenging nature of the terrain in Southeast Asia that defined Army Aviation and its level of usefulness to combat commanders. Although the high-density altitudes, unpredictable weather, and rugged landscape challenged pilots and their machines, the open terrain of Europe and the Middle East allowed Aviation to demonstrate its full potential.

Aviation Today and in the Future

Technological improvements in the last two decades of the 20th century greatly enhanced Army Aviation's capabilities. The development of night vision devices, laser-guided missiles, thermal imaging systems, improved engines and transmissions, and several types of UAS have given the army an invaluable edge over enemy forces. Today, the U.S. Army employs a variety of aircraft that carry out logistical, reconnaissance, and fire support missions.

Attack

The AH-64 Apache fulfills the army's need for an advanced attack helicopter. The heavily armed, tough, and agile helicopter suited the antitank role needed in Europe in the later years of the Cold War. Today, the Apache continues its attack and reconnaissance function in combat zones. The modern and upgraded version of the Apache, the AH-64E, has a fully digitized cockpit, improved targeting and navigation systems, and a 30-mm cannon and can carry up to 16 Hellfire antitank missiles.

Reconnaissance

The OH-58D Kiowa Warrior was first delivered to the army as an interim reconnaissance aircraft pending the completion of the RAH-66 Comanche, which was canceled by the army in 2004. The Kiowa Warrior

is a tough and versatile light attack and reconnaissance aircraft. Recent modifications in navigation and communication systems have made the Kiowa very effective in crowded urban centers as well as in vast deserts. The Kiowa Warrior's ball-like, mast-mounted sight enhances the aircrew's ability to conduct reconnaissance during day or night operations. The aircraft can be armed with a single heavy machine gun, 14 rockets, or four Hellfire antitank missiles.

The EO-5 and RC-12 fixed-wing aircraft also carry out the aerial reconnaissance mission. These unarmed aircraft are faster and fly higher than the Kiowa Warrior and are outfitted with electronic equipment that facilitate information gathering over large areas.

Lift

The UH-60 Black Hawk replaced the UH-1 Huey as the army's workhorse utility aircraft in 1979. The Black Hawk's dual engines make it more powerful and faster than the Huey. It can carry 11 fully equipped troops or sling load a 105-mm howitzer with its crew. The Black Hawk also serves as the army's primary MEDEVAC aircraft. The Special Operations Aviation Regiment uses the incredible diversity of the UH-60 by outfitting the aircraft with auxiliary fuel tanks for extended operations or a variety of weapon systems for combat missions. Recent modifications have made the UH-60M the world's premier utility military aircraft.

The cancellation of the Comanche in 2004 freed up funds that allowed the army to purchase a light utility aircraft. The UH-72 Lakota can carry out counter drug missions, VIP transport, civil search and rescue, or disaster relief, or serve as a MEDEVAC. The Lakota is not equipped to fly in a combat zone, which restricts its roles to permissive environments.

Cargo

The CH-47 Chinook entered service in 1962 and is the largest helicopter in the army's inventory. The Chinook is a twin-engine, tandem rotor helicopter that serves in a variety of roles with regular Army Aviation units and Special Operations Aviation Regiment. The impressive lift and speed capabilities of the aircraft make it ideal for a variety of challenging terrain. The Chinook can carry about 30 fully equipped troops and can sling about 14,000 pounds of cargo. The most recent CH-47F model introduced improvements to navigation systems,

the power train, and avionics. These improvements ensure that the Chinook will continue to serve the army well into the 21st century.

The UC-35, DHC-6, and the Gulfstream 5 carry out the army's VIP transportation mission. These aircraft deliver army general officers, civilian leaders, and combat commanders to important military and diplomatic missions that require face-to-face interaction.

Unmanned Aircraft Systems

UASs were first used in combat by the U.S. Army during Operation Desert Shield/Storm in 1991. In 2003, the army's Military Intelligence branch handed over authority of the UAS fleet to Army Aviation. The UAS provides real-time reconnaissance to combat commanders and can be more beneficial than a manned platform because it can often fly longer and does not expose personnel to enemy fire or other hazards. Today, the army primarily operates four types of UAS: (1) the RQ-11 Raven B, (2) the RQ-7B Shadow, (3) the MQ-5B Hunter, and (4) the MQ-1C Extended Range Multi-Purpose (Gray Eagle).

In 2004 and 2005, the army restructured its Aviation units and developed several combat aviation brigades. This action increased and diversified combat effectiveness, enhanced expedition, and streamlined maintenance procedures. Additional reorganization will take place as the army continues to integrate UAS into its combat aviation brigades.

B

BANDS AND MUSIC

Stemming from the practice of taunting the enemy with deafening howls and songs, music has been an integral part of warfare for millennia. Hebrews blew rams' horns at the battle of Jericho, the Saracens played kettledrums and various horns on horseback and camelback to frighten European crusaders, Scots played bagpipes into battle, and Santa Anna's buglers played *El Degüello* when attacking the Alamo. Communication has also been a main element of military music as battle operations grew in size and scope, with signaling on trumpets and drums becoming necessary. With the drums of infantry units also supplying cadences for marching, fifes were later added to this "field music" to provide melodic interest, with trumpets and kettledrums doing the same in cavalry units. The *haut-bois* (predecessor of the modern oboe) found its way into European practices in the 17th century from the Middle East, and by the late 18th century, it had been joined by pairs of clarinets, horns, and bassoons—a combination that became known as *harmoniemusik*. Added later to this combination were bass drum, cymbals, tambourine, and triangle ("Turkish Music"), and the idea of a "band of music" was born for use in ceremonial and social functions. This entry discusses the history and role of bands and music in the U.S. military.

Early U.S. Military Music

These early functions of military music crossed the Atlantic and continued to develop throughout the

period of the American Revolution, and with the invention of the valve in the early 19th century, U.S. bands adopted brass instruments in the German tradition because of their carrying power. By the time of the Civil War, bands of 16 to 24 musicians were typical for most military usage, with tens of thousands of musicians enlisting in the Union and Confederate armies.

Performing as ensembles, infantry band musicians entertained and motivated and served in military ceremonies, reviews, concerts, guard mountings, drills, dress parades, and on the march from battle to battle—with cavalry bands doing the same, except often on horseback. As well, signalers continued to function in utilitarian roles in camp and battle, with infantry drummers sounding numerous calls—including "March," "Retreat," "Troop," "To Arms," "Assembly"—and cavalry trumpeters playing the likes of "Boots and Saddles," "To Horse," "Forward," "Charge," "To Arms," "Taps," "Tattoo," "Reveille," "Retreat," and "To the Standard." While there were some cases of bands playing under fire, in terms of battle duty, most musicians served as medical assistants, stretcher-bearers, and so on. By the end of the 19th century, the bugle had supplanted the fife and drum for signaling, and the idea of a symphonic wind band, with sections of like-instrument groups similar to those of the orchestra, was becoming the norm with bands fully encompassing brass, woodwind, and percussion instruments.

World War I

During World War I, all U.S. service branches had strong musical components, with the army leading

the way with 7,500 bandmen (numbering 48 per band from July 1918) included among the 2-million-member fighting force serving over the course of the war's last 2 years. Navy bands of about 22 musicians were assigned from a band-training center at the Great Lakes Naval Training Station, developed by John Philip Sousa, to ships and naval stations, and around 1915, Marine Corps bands began to be formed by branching off from the U.S. Marine Band. While it is unknown how many of these Marine Corps bands of 28 musicians were formed, at least some regiments stationed in Germany, including the 5th Marine Regiment, had their bands with them.

Although attempts were made to remove bands from front lines, musicians were still often in the thick of things—digging trenches and latrines—and serving as stretcher-bearers, ambulance drivers, and gravediggers. Sometimes, the only musical duty they saw was for burial ceremonies, playing hymns like “Nearer My God to Thee” and slow marches of Chopin and Handel.

Along with official bands, music among the ranks during World War I was also common with organized troop sing-alongs and various units raising funds for the purchase of songbooks and sheet music, musical instruments, and even pianos. Perhaps the most noted sing-along took place during the week before Christmas in 1914 prior to the U.S. entrance into the war when unofficial ceasefires took place on the Western Front when German, British, and, to a lesser extent, French soldiers exchanged seasonal greetings, small gifts, and Christmas carols with one another.

During the war, as U.S. Army bands were playing alongside those of its allies—especially those of France's *Garde Républicaine* and England's Household Guards Division—General John Pershing, commander of the American Expeditionary Forces in Europe, envisioned a band of the same quality representing the army in Washington, D.C. This vision came to fruition with the formation of the U.S. Army Band in 1922. While the noted marine band had been a part of the Washington scene since 1798, the U.S. Army Band was really the turning point for all of the armed services in developing permanent professional-level D.C. bands, with the U.S. Navy Band comprising 63 excellent musicians by 1923, and with the U.S. Air Force Band following in 1941.

Although there had been several attempts at musical education in the army and navy over the years beginning of course with simple on-the-job training,

most of this was done on a sporadic nonstandardized platform. Finally, in 1911, a formal school for army bandmasters was established at Fort Jay on Governor's Island in New York Harbor, accepting bandmen students by 1914 and moving to Washington, D.C., in 1921. Similarly, in June 1935, the Navy School of Music opened in Washington, D.C., operating in conjunction with the U.S. Navy Band and sending complete bands to ships or stations as needed.

World War II

The World War II era, like that of past periods, saw music as a unifier and motivator with army, navy, and marine bands playing for traditional military ceremonies but now also emulating the civilian big bands of the period. Because of this increased breadth, professional civilian musicians enlisted, with others receiving commissions. The most famous of the latter was Captain, and later, Major, Glenn Miller, who went on to lead the Army Air Force Band and the Army Air Force Orchestra in the United States and England. Recording several records at Abbey Road Studios for use in propaganda broadcasts with the War Department in addition to countless live performances, these ensembles featured several civilian vocal soloists of the time, including Johnny Desmond and Dinah Shore. Many military installations hosted recreation and other centers where personnel were able to listen to recordings, take music lessons, and borrow instruments.

While radio in civilian and military operations had been in its infancy during World War I, it was in full force by the 1940s. Thus, to keep abreast of civilian developments, along with the establishment of the Morale Branch in the War Department in 1942, the Armed Forces Radio Service was formed in Hollywood with the mission of recording shows, acts, and music featuring the country's top entertainers like Bob Hope, Bing Crosby, and Judy Garland to be broadcast over Armed Forces Network radio stations overseas. Along with these stations, several frontline stations existed as well, including the Fifth Army Mobile Radio Station, which, along with music, regularly broadcast Major League Baseball and National Football League games, complete with American commercials at the Italian front. The psychological aspect of music appeared during this era as well, with Axis and

Allied radio stations playing popular music along with distributing leaflets to build audiences among the enemy in an attempt to convince the enemy of the hopelessness of its cause.

Often composed of musicians from some of the finest schools of music in the country, the World War II period also saw several short-lived yet pertinent all-female military bands within the Women's Army Corps: the Coast Guard's SPARS (derived from their motto *Semper Paratus*: always ready), the Marine Corps Women's Reserve, and the Navy's Women Accepted for Volunteer Emergency Service. Initially formed to support bond drives, these bands drew enough spectators to warrant cross-country tours to raise money for the war and boost morale.

Emulating Pershing's practice of the previous war in attempting to keep bands away from the front lines, circumstances sometimes dictated otherwise. One band whose members served in battle was the 4th Marine Band, also known as the "Last China Band," which left Shanghai in November 1941. Enduring the siege of Corregidor, they were held captive by the Japanese for 3 years.

While music had been used to soothe convalescing soldiers since ancient times, World War II was a period when efforts in music therapy were taken to return soldiers to duty or to civilian life in the best possible physical and mental condition. Hospitals began employing live musicians and recordings to help with physical exercise; instrument instruction; organization of bands, orchestras, and choirs; and to aid with resocialization and neuropsychiatric treatment.

Musical training continued to be a priority during this era, with the U.S. Navy School of Music becoming a separate entity from the U.S. Navy Band in 1942. The marines also began training their musicians there in the late 1940s—and in 1951, army students began enrolling to make the school a tri-service organization, which it remains to the present day.

Korea and Vietnam

Due to the infiltration, sabotage, and behind-the-line attacks by North Korean troops, keeping bands from front lines was not always possible. When bands did have a chance to perform, they often traveled long distances to perform concerts for units close to the front line and often had little time for musical training.

Duty in Vietnam was similar. Bands gave powerful psychological support, with the appearance of rock and jazz groups in remote areas assuring combat soldiers that they had not been forgotten. Like other military personnel, band members often found themselves filling sandbags, painting artillery shells, building bunkers, serving guard duty, and doing police sweeps—sometimes playing concerts in a metropolitan area like Saigon during the day and undertaking search and destroy missions in the surrounding countryside at night. Moreover, during screenings of villages for Viet Cong soldiers, bands often performed for the noncombatant populace to keep them away from the screening area.

As in World War II, popular music was a strong part of the picture over American Forces Vietnam Network, as well as G.I.-operated underground radio stations playing mostly acid rock. But now, stereos and tape decks are also readily available—providing variety at any time with songs like "Five Hundred Miles" and "Leaving on a Jet Plane" offering comfort for the homesick and war weary. And in the tradition of overawing the enemy of bygone millennia, American helicopters conducted bombing raids blasting Wagner's "The Ride of the Valkyries" on exterior speakers—depicted later in the movie *Apocalypse Now*.

The 1970s

Accompanying military restructuring as a whole during the 1970s and 1980s, U.S. military bands went through several organizational changes and served primarily in musical capacities. Composed of 91 musicians and 30 support personnel from all branches, a special bicentennial band was formed to commemorate the country's 200th birthday. Following their first appearance in Dover, Delaware, on April 9, 1975, the band toured all 50 U.S. states, Canada, Mexico, Puerto Rico, and the Virgin Islands until their concluding performance at a Pentagon ceremony on December 9, 1976.

The 1990s

With Iraq's invasion of Kuwait in 1990, U.S. military bands were involved in conflict again with all four armed services having bands stationed in the Gulf undertaking a variety of musical and military duties. The navy had a detachment of the Seventh Fleet Band deployed on various ships in the Gulf performing

concerts for the crews. The Air Force Desert Band traveled throughout Kuwait and Saudi Arabia performing in various capacities. In addition to musical duties, marine bands, including both the 1st Marine Division Band and the 3rd Marine Aircraft Wing Band, were typically engaged in perimeter security. The army had eight bands serving in Kuwait, Saudi Arabia, and Iraq, with many bandsmen spending countless hours guarding perimeters—and sometimes not seeing their instruments for months at a time. Some bands performed as diversions as they had during the Civil War—like that of the U.S. Army 3rd Armored Division, which on at least one occasion performed on the enemy side of a berm, while the division advanced into Iraqi territory. And again, the psychological aspect appeared as it had in Vietnam, but this time, it was with tankers rather than helicopters going into battle blasting the strains of Wagner.

The Present

Like the previous decade, U.S. service band work has varied across the world since 2003. Along with work in the United States, ensembles of musicians (anything from full-band to pop-rock groups) have served in Iraq and Afghanistan and other Middle Eastern countries performing on large bases as well as in forward operation areas, playing in military capacities, promoting troop morale, and serving as diplomats to host nation communities. In addition to conflicted areas, some navy bands have been deployed to establish good relations in Africa, the Pacific Rim, and Latin and South America. Beginning in 2006, the U.S. Air Force began rotating active-duty and Air National Guard Bands to U.S. Central Command to provide musical support and offer a musical “taste of home” for forward-deployed U.S. military units and coalition partners throughout the region. Accompanying the work of Department of Defense bands, American psychological operations teams used hard rock/metal music to induce irritation and frustration among opposing forces or playing popular Afghan music from aerial and ground radio stations in an attempt to win the trust and gratitude of the Afghan people.

At the time of this writing, the Department of Defense is the largest employer of musicians in the United States, with nearly 6,500 musicians serving in active-duty, reserve, and National Guard bands. In addition to those serving in traditional bands,

each service branch employs musicians in premier/special bands in or near Washington, D.C., as well as with their respective academies. The air force has more than 1,000 musicians serving in the U.S. Air Force Band, the U.S. Air Force Academy Band, and 10 regional and 11 Air National Guard bands. The army has more than 4,000 musicians serving with the U.S. Army Band (“Pershing’s Own”), U.S. Army Field Band, United States Military Academy Band, the Old Guard Fife and Drum Corps, and 30 active-duty, 18 Army Reserve, and 53 National Guard bands. The navy employs more than 700 musicians in the U.S. Navy Band, the United States Naval Academy Band, and 11 fleet/area bands. The marines have more than 700 musicians serving in the U.S. Marine Band (“The President’s Own”), U.S. Marine Drum and Bugle Corps (“The Commandant’s Own”), and 10 Marine Corps bands. Beginning with 32 drummers and fifers in 1798, the U.S. Marine Band is not only the country’s oldest military band, it is also America’s oldest continuously active professional musical organization.

With all U.S. service bands, musicians audition prior to enlistment, and after basic training, those headed for traditional army, marine, and navy bands head for the Armed Forces School of Music at the Joint Expeditionary Base at Little Creek-Fort Story in Norfolk, Virginia, where they prepare for the challenges of performance within concert bands, military/ceremonial bands, orchestras, jazz bands, big bands, rock bands, country-and-western bands, and various classical ensembles. While air force musicians do not attend a technical school, they are assigned to the drum and bugle corps flight during basic training for initial skills training, after which they go directly to their assigned band—including the air force premier bands. Musicians of all services headed for the other premier/special service bands do not attend the Armed Forces School of Music but head directly for their bands on completing basic training.

The similar goals of each of the services within their bands are to provide musical support for military personnel in ceremonies and entertainment, community relations at home and abroad, and recruiting initiatives. The command structure differs slightly according to the organization of the respective service branch. While all premier/special bands are commanded and conducted by commissioned officers, direction and command differ among the other bands and vary among commissioned officers,

The U.S. Marine Forces Pacific Band plays for the Sergeant Major's Relief and Appointment on Marine Corps Base Hawaii, April 8, 2011. Marines, sailors, family, and friends were present for the Relief and Appointment Ceremony for outgoing Sergeant Major James W. Sutton and incoming Sergeant Major Robert E. Eriksson.

Source: U.S. Marine Corps photo by Lance Corporal Jody Lee Smith (released).

warrant officers, and limited-duty officers. Sizes of bands also vary from 34 musicians for some active-duty and National Guard bands to 170+ in several of the premier bands, which in turn make up various independent ensembles.

Along with these official government-sponsored music-making and broadcasting elements, recorded music, although a part of military daily life since the invention of the phonograph and radio, has played an even stronger role with the availability and portability of laptop computers, CD players, iPods, mp3 players, and other devices. While military personnel have always composed music with the aid of simple instruments to express their wartime feelings, because of new recording, mixing, and editing programs, recording music is now possible within combat theaters, and in one instance, 4th25 (pronounced "Fourth Quarter"), a group of American soldiers led by Sergeant Neal Saunders, released *Live From Iraq*, the first rap album written and recorded entirely in Baghdad.

Today's warriors, like those of the past, prepare themselves psychologically for combat, but rather than listening to martial airs played by a live band,

they "pump up" primarily to recorded metal and rap music before and during missions. Through the use of technology and throughout all branches and ranks and wherever they are serving, military personnel listen to a wide variety of music depending on a host of demographic qualifiers for personal enjoyment, to remember loved ones, for relaxation and religious purposes, to stave off boredom, or to heighten aggressiveness—for the same reason that warriors have listened to music for centuries.

BASE REALIGNMENT AND CLOSURE

Base realignment and closure (BRAC) refers to the process created by Congress in 1988 to close or realign surplus American military bases. This entry explains the origins, process, and political involvement in the BRAC processes.

Origins of Base Closure

The United States dramatically expanded its military base infrastructure during World War II, leaving it with a surplus of shipyards, army forts, air

bases, and a host of other military facilities when the war ended in 1945. The U.S. Department of Defense responded to this excess base capacity by closing hundreds of military facilities prior to 1977, until Congress in that year passed a highly restrictive law that eliminated most closures. The congressional act stemmed from both congressional fears of the political consequences of base closure–related job losses and anger over charges that former presidents Lyndon B. Johnson and Richard M. Nixon had closed bases for political reasons. However, the apparent end of the Cold War in the late 1980s caused Congress to recognize that the shrinking U.S. military did not justify the existing base structure, and thus in 1988, Congress passed the Base Realignment and Closure Act. That legislation created the BRAC Commission, whose members the Senate nominated and the president approved, to preside over four base closure rounds. Those rounds, in 1988, 1991, 1993, and 1995, closed 97 bases and realigned more than 300 other facilities by reducing their size and scope. However, the Department of Defense personnel numbers had dropped by 36% between 1989 and 2003, while only 21% of U.S. military bases closed; so by 2004, the Department

of Defense still had 25% excess base capacity and thus requested an additional BRAC round. After considerable hesitation, Congress finally approved a BRAC round for 2005, though Defense Secretary Donald Rumsfeld changed his estimate of surplus base capacity from 25% to around half that size. Unlike previous BRAC rounds, the 2005 BRAC round closed very few large bases, though it did merge the operation of several colocated bases under the rubric of “joint bases.”

BRAC: The Process

The BRAC creators understood well the political consequences of base closure, and thus attempted to make the process both nonpartisan and transparent. Thus, the 1988 BRAC legislation specified both the BRAC commissioner appointment process and the BRAC base evaluation process. The secretary of defense appointed the BRAC commissioners for the 1988 round, though subsequent rule changes mandated that the Senate nominate six of the nine BRAC commissioners for presidential approval (three were presidential appointments) for the subsequent three rounds. Once formed, the BRAC Commission issued a broad set of closure guidelines, and the Department of Defense, in response to those guidelines, issued a “data call” from each military base. The results of the data calls, covering items like contribution to military missions, cost of facilities, quality of life, and numerous other measures, formed the basis of the military decisions on base closure. The data generated from each service then was fed into a cost-estimating program known as Cost of Base Realignment Actions to systemize the closure and realignment process. Then the Department of Defense derived a preliminary base closure and realignment recommendation from these data and forwarded that list to the BRAC Commission. The BRAC Commission then reviewed the Department of Defense suggestions, though the BRAC rules empowered the commission to add bases that it believed met the closure/realignment criteria and to remove those from the Department of Defense list that it believed should change status. The commission also held public hearings and selected commissioners visited each base on the Department of Defense list, seeking to maintain process transparency.

Following deliberations, the BRAC Commission submitted its closure and realignment list to the

president, who could either approve it in its entirety or send it back to the commission for reconsideration. Once the BRAC list received presidential endorsement, it went to Congress, where both chambers could only disapprove of the BRAC list through a joint resolution, so that Congress could not add or remove individual bases. The actual base closure and realignment process started after the completion of presidential and congressional actions. While BRAC laws mandated that actual closure or realignment start 2 years after the final decision, the BRAC rules offered several options to comply with the decisions. One option was to simply close the facility, transfer its functions and military personnel to another base, and offer the land and buildings for sale. Another option was to privatize the operation of the base, shifting from a service to a contractor. A third choice was to transfer an active-duty base to operation by either the reserves or the National Guard, while a fourth option allowed the transfer of military bases to a conservation organization for wildlife or heritage preservation. Finally, should all else fail, the military could just abandon a closed base.

Prior to any conversion, a closed base generally required cleanup. The military occupants of most bases often dumped toxic waste, insulated with asbestos and coated with leaded paint. Base firing ranges were filled up with unexploded ordnance over decades of use. BRAC rules required that bases must be cleaned to federal government standards before they could be converted to other uses. Since base toxic records were often incomplete, the initial costs of cleanup were often low, and thus, as they mounted, they often ate into the projected savings from base closure. Base cleanup problems often took years to remediate, thus delaying conversion and adding to the lost savings, with the cleanup bill probably exceeding \$14 billion for the 1988–2005 rounds. Conversion also required efforts to preserve historically significant sites on closed bases, and in the early closure rounds, conversion had to factor in a congressional requirement that closed bases must be considered for use by homeless persons (repealed in 1994).

Because closure can cause the loss of hundreds or thousands of jobs in the local community, BRAC worked with local reuse agencies to expedite conversion to alternative uses and to assist displaced base workers with training and job searches. Some bases successfully converted to other functions, sometimes

resulting in more jobs and income than had come from the former base. Bergstrom Air Force Base became a municipal airport for Austin, Texas, and the Charleston Naval Shipyard became the new home to dozens of civilian businesses after its 1993 closure. San Francisco's Presidio came under the jurisdiction of the Presidio Trust, which has both preserved the historic sites at the base and made it economically self-sufficient. The Port of Oakland now operates the property of the former Naval Fleet Industrial and Supply Center in Oakland, California, as a container terminal. Some active-duty bases became Army Reserve or National Guard bases (there are more aircraft at Carswell Joint Reserve Base in Texas now than there were when it was an air force base). There are also base closure failures, where conversion was difficult or the costs of cleanup became prohibitive. Craig Air Force Base near Selma, Alabama, remains largely deserted despite decades of efforts to convert it to civilian use, and San Francisco's Treasure Island Naval Station and the neighboring Alameda Naval Air Station still have not been converted to alternative use after their 1993 closure. In some cases, adequate funding for conversion never materialized, in other cases, civic leaders could not agree on base reuse, and in yet other situations, the cost and challenge of environmental cleanup prevented reasonable conversion.

BRAC: The Politics

Prior to 1977, hundreds of surplus military bases closed, but sometimes charges arose that political motives were behind some closure decisions. Critics accused President Lyndon B. Johnson of closing bases in states that voted against him in the 1964 election, and later President Richard M. Nixon faced similar charges for closing bases in Massachusetts, the only state that voted for his rival in the 1972 election. Partly in response to these charges (which both presidents denied), Congress made base closure almost impossible in 1977 before reluctantly agreeing to BRAC.

To assume that BRAC would take the politics out of base closure was probably unrealistic, however. Military bases can generate millions of dollars in revenue for their surrounding communities, from civilian jobs on base, from impact funds to offset the cost of the base to the local area, and from community spending by the military. Moreover, the 2005 BRAC process included consideration of National

Guard bases, which added state governors to the political mix. So while BRAC changed the political rules, political figures simply found new ways to influence base closure. They had several avenues available, including the nomination of BRAC commissioners, the funding of new base projects to reduce the possibility of closure, and the use of data to either make their base more favorable or reduce the value of a rival base.

Beginning with the 1991 BRAC round, the Senate nominated BRAC commissioners, allowing senators to choose nominees who might spare bases in their states. Thus, one of the nominees for the 1995 BRAC process included a former base lobbyist and several retired officers who had been base commanders in states represented by their nominees. Another nominee was married to a representative who had two bases in his California district. It is unclear whether or not the presence of these and other commissioners with ties to bases affected the process because the closure record on the bases they "represented" is mixed, but their appointments created the impression that BRAC had not entirely eliminated politics from the base closure process.

Members of Congress could also steer funds to their bases for rehabilitation, new construction, or "re-missioning" (moving one function from one base to another to help keep it open). Since one criterion used in base closure decisions was value of new construction, congressional members spent billions of dollars during the BRAC periods trying to make bases in their states and districts closure resistant.

Political figures also tried to use base information as a lever, engaging in tactics like leaking negative information about rival bases (e.g., one base's political supporters noted the hurricane vulnerability of a rival base in Florida), and in 2005, the communities of El Paso, Texas, and Lawton, Oklahoma, contested with quality-of-life data over which city would be a better host to an army base as the army considered moving its Artillery School from Fort Bliss, Texas, to Fort Sill, Oklahoma.

In some cases, political "resistance" was more symbolic than real, with scenes of political leaders denouncing the closure of a local base as inherently unfair, or detrimental to national security, or, in one case, taking the closure decision to the Supreme Court in a quixotic campaign to be seen doing something (the appeal lost). It is also the case that most base closure decisions came from the objective

BRAC process and that political influence on base closure was secondary to that process.

Conclusions

The BRAC process succeeded in closing hundreds of military bases after Congress virtually prohibited such actions in 1977, saving around \$16 billion in initial savings and generating annual savings of \$6 billion (less than 1% of the total annual defense budget, though). However, environmental cleanup continues at some of these bases so the total savings remains unknown. These rounds cost around 107,000 civilian jobs at closed bases, though some of these workers later found new jobs when the base converted to another use. The 2005 BRAC round was the most limited, and even the 2005 BRAC Commission chair claimed that its cost-savings expectations were inflated and that another round might be needed. However, given the growing political opposition to base closure, and the magnitude of the six previous rounds, another BRAC now appears quite unlikely.

power served to counter the threat posed by the Soviet Union and, later, the People's Republic of China. Following the end of the Cold War, the United States closed a number of bases, especially in Europe and the Philippines. U.S. involvement in the Persian Gulf War, and the more recent conflict in Afghanistan, however, led to a significant expansion of the American presence in the Middle East and Central Asia. The end of U.S. involvement in Iraq and a diminishing role in Afghanistan, however, are combining with mounting fiscal constraints to drive a continuing reduction in the number and size of the more than 600 U.S. military sites overseas.

Pre-1945 Foreign Bases

Before World War II, most foreign bases were naval bases, located primarily in U.S. territories acquired in the 19th century and early 20th century—including the Philippines, Hawaii, Guam, American Samoa, Midway, Panama, Cuba, and Puerto Rico. During World War II, the United States, through a lend lease agreement with Great Britain, gained the right to build a network of bases on British territory in the Western Hemisphere in order to counter German and Italian expansion. America's entrance into the war led to the establishment of more than 2,000 bases on all continents except Antarctica.

U.S. military presence in foreign countries did produce significant tensions, even among close allies. For instance, the higher standard of living of the American troops based in England led to many British civilians complaining that American GIs were overpaid, oversexed, and over here. Large military bases have historically attracted large numbers of prostitutes, and U.S. bases abroad were no exception. In the case of military bases in underdeveloped regions of the world, the opportunity for sexual exploitation of the civilian population escalated.

Victory against Germany and Japan led to a reduction in the number of overseas bases. Even before the war ended, many staging bases in Australia and Great Britain had been rendered obsolete as the war shifted closer to Japan and Germany. The rapid demobilization of the American armed forces after the end of hostilities further encouraged the closing of bases. Only in Germany and Japan did the number of U.S. bases expand for the United States to oversee postwar rebuilding in the defeated nations.

BASES, FOREIGN

Following the Second World War, the United States dramatically expanded its overseas military presence, creating a global network of bases in dozens of countries around the globe. This projection of American

Foreign Bases in the Cold War Era

The Cold War encouraged the United States to establish new bases around the world. Initially, many of these bases in Europe, North Africa, and Asia were forward bases for bombers with the Strategic Air Command. As the Cold War deepened, the United States increased the number of conventional forces deployed abroad to serve as a deterrent to possible Soviet or Chinese aggression, especially in Europe. After the Korean War ended, the United States continued to maintain a significant troop presence in South Korea and bolstered forces stationed in Japan.

During the early Cold War, U.S. bases overseas embodied the military and economic strength of the United States in this era. The United States maintained these bases without any assistance from host countries and strove to make them into “little Americas.” The military encouraged service members, and even enlisted personnel, to bring over their families. To serve their needs, an array of schools, churches, social organizations, shops, and restaurants were built and maintained that served to minimize the need for cultural exchange with indigenous populations.

The placement of bases in foreign countries required complex negotiations with host governments on a range of issues, ranging from providing land for the American presence to limiting the jurisdiction of foreign courts with regard to crimes committed by U.S. troops. The growing assertiveness of newly independent countries led to several countries calling for the United States to remove bases from their nation, especially in North Africa. At the same time, growing technological advances in delivery systems for nuclear weapons and communications made many of these bases obsolete and further encouraged the United States to withdraw from them in the 1960s and 1970s.

During the Cold War, the U.S. overseas presence remained strongest in West Germany and Japan. After signing a mutual security treaty with Japan in 1960, the United States agreed to defend Japan from any potential threat from its neighbors in exchange for the United States placing a number of military sites in the country (the largest and best known being in Okinawa).

Foreign Bases After the Cold War

After the collapse of the Soviet Union, the Department of Defense (DOD) downsized its overseas

operations, especially in Europe and Asia. The United States sought to maintain a military presence in the Philippines, but nationalist sentiment led the United States to withdraw from bases that the United States had maintained for nearly a century, most notably Clark Air Force Base and Subic Bay Naval Base. Although the United States downsized, it did not entirely eliminate its military presence abroad, and many Cold War-era bases provided important staging points for the wars in Iraq and Afghanistan. Even though Germany opposed the Iraq War (2003), it has allowed American military casualties to be evacuated to Landstuhl Regional Medical Center.

Nations’ willingness to provide a location for a foreign power’s forces became a major question after the Cold War—an issue highlighted during the Persian Gulf War. U.S. installations had faced violent opposition from German terrorists in the 1980s and from Filipino communist insurgents around the same time, but the larger issue increasingly gained recognition in the evolving post-Cold War era. Ironically, some scholars argued that the U.S. military presence in Middle Eastern countries such as Saudi Arabia (which experienced a large buildup of U.S. military presence during the Persian Gulf War) led at least in part to the 9/11 terrorist attacks.

The U.S. presence abroad has obviously not gone without protest or incident. The difficulty of maintaining military installations in large, foreign, civilian populations has often been made more difficult by the laws regulating how U.S. troops are punished for crimes committed against foreign citizens. In 1995, three U.S. servicemen raped a 12-year-old Japanese girl in Okinawa, highlighting the significance of this issue. In the wake of that crime, the U.S. servicemen utilized the Status of Forces Agreement—originally agreed to 1960—as a means of escaping criminal prosecution for their crime. Despite vocal protest by Okinawans and the prefect’s governor, two of the three men were sentenced to only 7 years in prison, and the third man was sentenced to just 6½ years. This example, moreover, reflected an ongoing trend; from the time of Okinawa’s reversion in 1972 up to the time the rape was committed in 1995, more than 110 rapes had been committed by U.S. servicemen in Okinawa, a small subset of the 4,784 crimes committed by U.S. servicemen during that period. Negative social effects of overseas basing have also included the development of a large class of prostitutes and the proliferation of “camp towns” around bases in countries like South Korea.

Recent Issues

As of this writing, the U.S. DOD maintained 666 foreign installations worldwide. Of them, 316 serve the U.S. Army, 114 the U.S. Navy, 216 the U.S. Air Force, and 20 the Marine Corps. Only 21 of these locations are classified as “large sites,” and most (576) are listed as “small sites.” It is estimated that the United States spends about \$250 billion each year on overseas basing, though that number has been cut significantly in the past 2 years (there were more than 700 overseas bases as recently as 2010). The number will likely continue to shrink in areas such as western Europe and northeastern Asia, and the focus will probably continue to shift toward smaller, less costly operations in the Middle East.

This trend toward smaller bases has been a major factor affecting the way the United States operates overseas. On top of the cost, there has been a major push in recent years to limit troop contact with host populations, in addition to a general move away from quartering families overseas. Currently, and in years to come, the major geographic trend of foreign basing will move farther away from traditional industrialized allies of the United States and closer to smaller, less wealthy nations. The root of this shift is obviously the Global War on Terrorism, which has identified as its primary enemy a fanatical terrorist group that does not operate out of a large geographic location like the Soviet Union or China. In addition to the declining wealth and size of host nations, many countries may be less open to large numbers of young Americans establishing outposts in their territories.

The Middle East has obviously become the focus of military basing in recent years. With the U.S. expulsion from Morocco and Libya during the Cold War, expansion into other Middle Eastern countries has been considerably more difficult, largely due to local resistance to colonial-type influence. After the Persian Gulf War, increasing anti-American tensions in the Middle East became a cause for concern that was rarely addressed until the September 11, 2001, terrorist attacks. The realization that many countries no longer wished to support U.S. military bases as launching pads for war (particularly Germany and France) became evident as bases were sought from which to carry the fight against Iraq in 2003.

The DOD was subsequently forced to find a number of new locations from which to operate in

the Middle East, as traditional sites in Europe and Asia were no longer viable. New locations for U.S. bases springing from this trend include Djibouti and the Horn of Africa, and there are currently a number of other U.S. bases in Middle Eastern countries like Bahrain, Kuwait, Oman, Turkey, and the United Arab Emirates.

As of 2012, the new Defense Strategic Guidance policies issued by President Obama and the DOD recognize the necessity of Gulf region cooperation with U.S. interests to continue pursuing combat in Afghanistan, defend Israel, and prevent Iran from gaining nuclear capability. This suggests the ongoing importance of the U.S. role as a “global policemen,” while still recognizing the significant number of U.S. bases in traditional locations such as western Europe and Japan.

Conclusion

U.S. bases in foreign countries have been a source of prosperity for some nations and resentment for many others. Crime committed by service members, as well as environmental damage caused by the bases, has not endeared the U.S. military presence to many nations, though the effects of military basing overseas have also often been positive, both economically and politically (the biggest examples being Germany in the immediate aftermath of World War II). The end of the Cold War and the collapse of the Soviet Union, as well as the increasing presence of China on the global stage, demanded major shifts in DOD strategy for overseas operations. As the United States aims to end its wars in Central Asia, concerns are shifting toward locations in the Middle East, North Africa, and the Horn of Africa. The presence of larger cultural differences between U.S. forces and local populations require ongoing shifts in all elements of U.S. basing strategy.

BASES, U.S.

Military bases are the foundation of the national defense infrastructure, serving as centers of housing, operational training, and logistical coordination. Defense installations have always been a part of the American military experience, ranging from small outposts guarding against Native American raids on the national frontier, to harbor forts protecting strategic ports, to the 21st-century military communication centers facilitating operations on a global scale. While serving a variety of functions over the span of American history, these facilities are the geographic embodiment of the power of the American military. These installations also wielded considerable influence on nearby civilian communities. Military bases often serve as sites of economic stimulus, social upheaval, environmental change, and demographic growth. During the late 20th century, issues surrounding the nation's domestic military base infrastructure became topics of heated political controversy. This entry focuses on the expansion of the military base system during World War II and the Cold War, the impact of these bases on nearby civilian communities, the influence of military bases on the Civil Rights Movement, and of the closure and realignment of the military base structure to reflect the new priorities of the Defense Department and the American people.

Expansion of the Military Base Infrastructure During World War II and the Cold War

While the American armed forces has relied on a network of military bases to function throughout its history, during the mid 20th century the scale of this network increased dramatically to meet the demands of two global conflicts—(1) World War II and (2) the Cold War. During World War II, the War Department and the Navy Department established hundreds of new facilities to train, house, and coordinate the millions of new servicemen and service-women who entered the military in the wake of Pearl Harbor. While these two departments built installations throughout the nation, many of these new bases were established in the southern and western regions of the United States, bringing to these areas billions of dollars of federal spending and tens of thousands of soldiers, sailors, and marines, as well

as their families, and civilians seeking work on these new facilities.

After World War II, many of these installations decreased in size or were deactivated, ending the presence of the military in many communities. As America entered the Cold War, however, the Defense Department established new bases, expanded existing facilities, and reactivated formerly closed installations. While the establishment, expansion, and reactivation of bases usually reflected military needs, political influence often played an important role in determining where bases were placed and which were reopened. Local political and business interests coordinated with state and congressional representatives to attract military bases, expand them over time, and keep them safe from closure.

The Impact of Military Bases on Civilian Life

The rationales for the vigorous defense of military installations by local, state, and national politicians centered on the important impacts military bases have on local communities, especially in regard to economic, demographic, and social conditions. While these influences possessed both costs and benefits, the overall burdens associated with defense installations usually were outweighed by their advantages.

Economic benefits were perhaps the most important feature associated with the presence of a military base. While many bases were often designed as self-contained military cities with their own housing, social services, and entertainment, personnel stationed at military facilities often spent their incomes in local businesses off base, providing the community with a reliable customer base. New businesses even emerged, catering specifically to service members and relying almost exclusively on the military base for their clientele.

Military bases often employed substantial numbers of civilian workers, providing an important source of well-paid jobs to the community. Civilians often staffed base offices, kitchens, laundries, and other facilities. Civilian staffs on military bases became more important after the end of the draft in 1972, as the number of soldiers available for noncombat duties declined. Recent trends in outsourcing and government agencies obtaining private sector contracts for such services ensures the importance of civilian workers on military installations.

Historically, the wages and benefits enjoyed by civilians on military bases have outpaced compensation for civilians laboring off base. Military bases represented sources of stable and remunerative civilian employment, especially in regions of the country lacking a diversified economic sector.

Defense installations also drove demographic growth. Military veterans often retired near bases to have ready access to military hospitals or base commissaries where they could purchase consumer goods at far lower prices than at local businesses. The retirement benefits used by veterans and the money spent by military personnel and civilian workers increased local tax revenues, increasing the ability of local municipalities to fund education, social services, and support civil infrastructure. In sum, military bases often brought substantial economic benefits to the communities they neighbored.

However, these economic benefits were usually accompanied by significant costs. Communities possessing a military base often failed to develop a diversified economy, relying on federal spending as the sole source of jobs and tax revenue. The arrival of thousands of military personnel and their families could also cause significant overcrowding in local schools, congestion of local transportation networks, overburdened hospitals, and stresses on other community facilities. Over the course of the Cold War, Congress authorized funding to alleviate this overcrowding, but such funding often deepened the dependence of local municipalities on federal appropriations to maintain their civic infrastructure.

If military bases brought economic costs and benefits, they also brought social change in both positive and negative ways. Defense installations often drew military personnel from across the nation, providing a measure of cosmopolitan influence to sometimes parochial communities. This cosmopolitan influence was welcome when it brought social and cultural uplift to the civilian community, influences that numbered among the prouder elements of the American military tradition. Less welcome were more suspect elements of this same tradition: drunkenness, prostitution, petty crime, rape, and public violence. Military and civilian police often struggled to regulate these behaviors, and civil-military relations were sometimes strained regarding these issues.

One further drawback that must be accounted for in this balancing of the costs and benefits of military bases for local communities is the environmental

impact of the presence of the military. Military training often left undetonated ordnance scattered across defense installations, often leaving the area unsuitable for agricultural production, housing, or any other civilian use. More problematic was the improper disposal by the military of toxins on military bases, which polluted local aquifers and threatened local air quality. Substantial federal funding was appropriated to address these issues, but health problems relating to environmental pollution are sometimes higher in civilian communities near a military base than those without such a facility.

Military Bases and the Civil Rights Movement

Perhaps the most important impact military bases had on local communities concerned race relations, especially in the American South. During World War II, the American military existed as a segregated institution. On military bases, this meant African American soldiers slept in separate barracks, ate in separate messes, and even worshipped separately in base chapels. African Americans frequently endured unequal conditions off base as well. Often, Black soldiers could only obtain service at local restaurants, entertainment venues, and public transportation in sections reserved for “colored only.” Especially in the South, African Americans often endured disproportionate racial violence from local police forces and civilians, resulting in a series of violent clashes between military and police forces.

Victory in World War II brought significant changes regarding the military’s stand on civil rights. In 1945, the War Department appointed a commission led by Lieutenant General Alvan Gillem Jr. (known as the Gillem Committee) to investigate the wartime service of African Americans and the conditions they endured on military bases at home and abroad. On the basis of the Gillem Committee’s recommendations, President Harry S. Truman issued Executive Order 9981 commanding the desegregation of the American military in 1948. This order transformed military bases into integrated spaces for the first time. In some parts of the nation, military bases represented the most racially integrated spaces in the area.

In the American South, however, off-base conditions for African Americans remained highly segregated and often dangerous. The arrival of the Civil Rights Movement in 1954 following the

U.S. Supreme Court's decision in *Brown v. Board of Education* soon inspired legal challenges and protests by African American servicemen stationed on southern bases. Like their civilian counterparts, military protesters often encountered brutal reprisals from civilian police and civilians defending Jim Crow. To combat segregation in military communities, Secretary of Defense Robert McNamara issued a directive in 1963 that used the military's economic influence within local communities to eliminate discriminatory practices. Military base commanders were authorized to mark "off limits" any restaurant, entertainment venue, housing complex, or other public facility that refused equal service to African Americans. If a commander designated a business "off limits," no serviceman could lawfully frequent that establishment. Many businesses near bases depended on military clientele for survival and could not afford to be marked off limits. While racial animosity sometimes lingered, in the two decades after McNamara's directive, African American servicemen could safely dine, shop, and travel off base. The military's economic and social influence on nearby communities played an important role in the elimination of segregation, contributing to the grassroots activism and federal legislation that helped advance the Civil Rights Movement.

The End of the Cold War and the BRAC Commission

While military bases often represented the foundation of many local economies, collectively they represented a sizeable cost to the Defense Department and ultimately to the American people. Beginning in 1977, the American military establishment attempted to reduce this cost by closing bases whose strategic missions were obsolete or duplicated by other installations. Congressional representatives generally opposed base closures because of fears that facilities in their districts might fall prey to budget cuts. Thus, despite a decade of effort from military officials, congressional intransigence prevented the closure of a single base from 1977 to 1988.

The end of the Cold War forced legislative compromise. After decades of conflict, the trillions once spent by the federal government on defense were converted to a "peace dividend" funding social services. The American military endured significant

cutbacks in funding and manpower, leaving many bases without a clear mission. Yet closing these bases still proved problematic. It was widely agreed among both American political and military leaders that the base closure process should reflect military necessity and the national interest and not the parochial interests of individual congressman. To meet these goals, in 1988, the Congress created the Base Realignment and Closure (BRAC) Commission, an independent body that investigated which military facilities should be retained, reduced, or closed altogether. The BRAC Commission's investigations yielded the largest reduction in military facilities since 1945, and by 1995, more than 500 military bases had been closed or realigned, saving billions of taxpayer dollars.

However, these savings often came at a high price for military base communities. The closure of a base meant the loss of jobs, federal investment, tax revenue, and even a sense of community identity. Communities without diversified economies usually suffered the hardest when bases closed, with those left unemployed by a base closure lacking alternative job sectors to transition into. Some towns successfully converted the spaces left behind by the American military into new industrial or commercial centers, but many struggled to achieve this, especially if the environmental legacies of the former military presence proved particularly toxic.

The military challenges of the 21st century have again redefined the national needs for the military base infrastructure. The global military operations initiated after 9/11 prompted new demands on military bases during the Global War on Terrorism. When the BRAC Commission last met in 2005, its recommendations focused less on base closures and instead on Secretary of Defense Donald Rumsfeld's efforts to transform the American military into a lean, flexible institution capable of rapid operational effectiveness on a global scale. Those military installations that had survived the various cuts of the BRAC Commission have increased in size and economic influence on neighboring civilian communities. America's present military bases will continue to play an important role in the effectiveness of the armed forces and play an important role in the social and economic prosperity of the communities surrounding these bases.

BATTLESHIPS

The battleship is the most formidable artillery-based vessel in naval service. It has the largest guns and the most armor for survival in combat. Though initially constructed to duel other battleships, they are also expedient in interdicting near-shore routes favored by the enemy and are excellent support vehicles for landing forces during a contested assault on a foreign shore. This entry describes the designs, uses, armament, and speeds of battleships from the early 20th century to the modern age.

Early History

The modern battleship came of age after the Russo-Japanese War of 1904–1905. Both the increasing size of the secondary armament (smaller caliber than the main battery but intended for battle line combat) and the decisive naval battle of Tsushima (May 1905) gave evidence for the need for the greatest number of the largest caliber guns in combat. Shell

splashes of the smaller caliber guns were becoming less distinguishable from the main battery, and the purpose of the secondary battery changed from action against the enemy battle line to protection from the increased capability of torpedo boats. Thus, HMS *Dreadnought*, the first commissioned all-big-gun battleship, gave its name to the new type, with 12-inch guns standard (11-inch, for Germany).

Design Considerations and Construction

Battleship armament and size increased steadily in the years immediately preceding the Great War (World War I). The Royal Navy increased caliber from 12 to 13.5 to 15 inches in 4 years. The German Fleet increased to 12 inches and later to 15 inches for two battleships. The United States and Japan increased from 12 to 14 inches for the war. Both navies would build 16-inch battleships before the Washington Naval Disarmament Talks of 1922.

As a military asset, battleships were to take their place in the battle line, to engage and defeat the enemies of the nation, especially other battleships. For this, they were given armor, heavy artillery, and a propulsion system to move them about. The armor was meant to be proof against the opponent's artillery, usually with specific ships or likely enemies in mind. Propulsion was a compromise of what was technologically feasible, given a specific fuel source and space. All were factors of cost to the nation in terms of building, maintaining, and, since 1922, treaty obligations. A battleship was a large asset that had large costs in fuel, ordnance expenditure for training, crew levels, and maintenance. While they excelled in armed conflict against an adversary with a seacoast, they lacked versatility in duties. Consequently, they spent a lot of time in mothballs or training cruises.

Speed was a concern for the larger battle cruisers. Speed for dreadnought battleships was generally 20 to 21 knots—24 knots for the *Queen Elizabeth* class. British battle cruisers traded speed (27–29 knots) for armor, though armed with the same heavy guns. Germany traded a 2-knot speed inferiority for increased internal protection.

The Washington Naval Treaty of 1922 and subsequent meetings settled on a 5-5-3-1.75-1.75 ratio for battleship tonnage for Great Britain, United States, Japan, Italy, and France, respectively. Provision was made for replacement of older battleships with

newer construction provided that the tonnage ratio was maintained, not necessarily the numbers of ships. Gun size was limited to 16 inches. Tonnage per ship was limited to 35,000.

After Germany and Japan renounced the treaty guidelines in the mid-1930s, all parties capable of building battleships began a new naval arms race. Japan would build the largest new battleships, the 70,000-ton *Yamato* class with 18.1-inch guns. The United States stayed with 16-inch guns but focused on speed—28 knots for *North Carolina* and *South Dakota* classes and 33 knots (officially) for the *Iowa* class. The continental powers and Great Britain settled on 15- and 14-inch guns, respectively, and speed of 28 to 30 knots.

Purpose

There is no weapon system in the world that comes even close to the visible symbol of enormous power represented by the battleship.

—General P. X. Kelly, U.S. Marine Corps (Retd.)

Influencing nations by battleship diplomacy has long been the political expedient to make foreign powers amenable to one's will. From Admiral Matthew C. Perry's visit to Japan in 1853 to the Royal Navy's *Orion*-class battleship's visit to Germany to celebrate the opening of the Kiel Canal in 1914, the battleship has been used to impress others by its size, capabilities, and offensive potential. As a movable symbol of a nation's technological superiority and manufacturing capability, these ships had no equal.

Throughout World War II, battleships maintained two usages for which the aircraft carrier was not suited: (1) long periods of close-in support of ground troops, especially a contested invasion, and (2) at night. Support of invasions and general combat in the littoral area is the modern battleship's forte. Allocated to second-line battleships in both World Wars, this firepower support gave the assault force ashore a quick and responsive artillery presence, which was not lost on the defenders. Battleships, even old ones, carried artillery far larger than anything a land army could haul along. This advantage worked at night and during inclement weather, both times of restricted aircraft involvement. For the newer battleships, antiaircraft protection of the aircraft carriers was the primary duty.

Until the end of World War II, the battleship had a mystique about it and a rabid following. Josef Stalin had visions of constructing his own battleships up to his death in 1953, and the United Kingdom and France each completed a battleship after the war. These ships did the statesmanship duties of showing the flag, as did their predecessors. By 1960, however, the cost to operate and maintain these assets was not seen to bring the same returns as before. As the world became more global, new nations arose in the former colonial spheres; with the nonconventional wars being fought, such symbols of resolve lost their luster and their place in the current political arena.

Following World War II, the newer U.S. battleships were put in reserve except for the *Iowa* class. The older ships were either passed on to state delegations as memorials or were expended at Bikini Atoll during the Able and Baker atomic tests of 1946, after which the ships were scuttled as too radiologically hot to return for scrapping stateside. Other countries scrapped their battleships by 1960 and Turkey by 1971.

Only the *Iowa* class was used for anything after World War II. They were used in Korea for shore bombardment, but even these exercises alternated with training cruises, especially the midshipmen of the Naval Academy. All were placed in the mothball fleet during the early 1960s, while their older cousins were scrapped or moved to seaside states as museums.

Reinstatement

As an exercise and political ploy, The USS *New Jersey* was taken out of mothballs and upgraded with new weaponry for use in the Vietnam War. The *New Jersey* was used for two deployments for gun-fire support in South Vietnamese waters only. Except for a later deployment to Lebanon in 1983–1984, she was retired once again.

This experience underscored the feasibility of including all four *Iowa* class ships—(1) USS *Iowa*, (2) USS *New Jersey*, (3) USS *Wisconsin*, and (4) USS *Missouri*—in President Ronald Reagan's 600-ship navy. They were modernized extensively, especially the crew spaces and command and control with a new Combat Engagement Center, given the latest in naval missile and antimissile technology: 16 Harpoon antiship missiles in four Mark 141 launchers of four missiles each; 32 Tomahawk cruise

missiles in eight launch boxes of four missiles each; the latest in antiair and antimissile defense, namely, four Vulcan Phalanx CIWSs (Close-In Weapon Systems) covering a full 360°; and the latest radars and unmanned aerial vehicles (UAVs) for spotting. They each lost four of their 5-inch 38-caliber dual turrets and all other light guns. They each retained their main armament: nine 16-inch 50-caliber in three triple turrets and 12 5-inch 38-caliber in six twin mounts. With such a change in weaponry, the crew demands were lowered to about 65 officers and 1,500 crew, down from the 2,100 officers and men when first commissioned and the 2,900 carried at the close of World War II.

After the fall of the Iron Curtain and the demise of the Soviet Union, the ships' purpose was uncertain. The invasion of Kuwait by Iraq brought a short-lived career extension with Operation Desert Shield and then Operation Desert Storm (Persian Gulf War) in 1990–1991. They were relegated to reserve status during President Bill Clinton's administration. The USS *Missouri* and *Wisconsin* were reactivated for use in Operation Iraqi Freedom (Iraq War) in 2003 by President George W. Bush in which they fired the first shots (Tomahawk cruise missiles). The ships have since returned to their museum status, although they have had regular refits and maintenance.

Discussion About Usage

Battleships are expensive units to maintain both in asset allocation and the fact that they are still oil fired. In a navy of nuclear-powered smaller craft, oil-fired battleships are a true anachronism. Conversion to nuclear power would not be cost-effective for the allocation of shipyard space, crew assignment, and security and maintenance issues.

In the modern age, the aircraft carrier can still project combat power farther inland than can the battleship, cruise missiles excepted. The operational footprint of an aircraft carrier is the combat range of its aircraft; for the battleship, it is the range of its artillery, 23 nautical miles—well within the range of antiship missiles. Against individual insurgents in the modern combat arena, the targets for such heavy ordnance are not there, and the intelligence for finding such targets is spotty at best. In the role of humanitarian aid, the aircraft carrier, with its much larger deck space for helicopter operations, is more readily amenable to render assistance.

Battleships have not been stricken from the navy roster, however. Congressional mandates keep these ships maintained until a suitable replacement can be in hand for the shore combat support role. The amount of maintenance varies on each vessel, with the newly demothballed *Iowa* getting the least, and *Missouri* and *Wisconsin*, the last activated, getting the most. However, there is not much need for more than these two battleships for the foreseeable future.

BENEFITS, MILITARY

Military personnel receive a total financial compensation package that comprises both pay and benefits. Unlike pay, which comes in the form of direct monetary payments, benefits are typically provided either as *in-kind goods and services* (e.g., military housing, paid leave, meals, health care, and educational assistance for active-duty service members) or as *deferred payments* only available to veterans and retirees (e.g., retirement pay and disability pay). In addition, benefits may include other rewards and privileges whose monetary value is more difficult to calculate—for example, citizenship for soldiers who are not already citizens at the time of enlistment or military honors at funeral services. This entry examines the evolution of military benefits and then

describes the types of benefits for active-duty and retired U.S. military personnel and their families.

Background

Military benefits resemble employee benefits in the civilian world in important ways: They can be treated as part of the overall compensation package, they contribute to efforts to recruit and retain personnel, and they enhance the overall quality of life for service members. However, many benefits evolved to fulfill specific military purposes, sometimes mitigating the distinctive hardships and hazards of military life, at other times simplifying the complex requirements of military administration and logistics. For example, in ancient Greece, Athens and other city-states addressed the ever-present risk of death or injury on the battlefield by providing official pensions for disabled veterans and children orphaned by war. In 17th-century Europe, armies began providing uniforms, weapons, housing, and meals for soldiers as a means of streamlining their increasingly unwieldy systems of military pay, billeting, and food provision.

Military benefits can also satisfy broader social or political goals. Indeed, even retirement benefits and pensions, which are usually considered to be a fairly transparent form of deferred financial compensation in the civilian world, have in the military context often served as instruments of social policy or political strategy. In ancient Rome, during the 1st century BCE., the policy of providing land grants for time-served veterans—promoted by ambitious generals such as Sulla, Pompey, and Caesar—not only provided for the material well-being of retired soldiers but also served to ensure their loyalty in contemporary political struggles. The military retirement homes and pensions that appeared in France during the 1600s reflected, in part, a changing relationship between soldiers and the states they served—a tendency that took on even greater momentum in the years after the French Revolution. And in the 19th-century United States, pension benefits for Union Civil War veterans were heavily conditioned by political party competition and the practices of patronage politics.

As all-volunteer military establishments have become increasingly common across the world, military benefits have come to be understood primarily as a subset of military compensation. It remains a matter of debate whether benefits are the most cost-effective

way for military organizations to recruit, retain, and reward personnel, and many commentators advocate increasing cash payments for service members rather than maintaining or extending benefits.

Benefits in the U.S. Volunteer Force

Benefits represent nearly 60% of the overall compensation package for members of the U.S. military. Key categories of benefits for American military personnel include housing, meals, health care, paid leave, survivor and disability payments, subsidized retail privileges, and retirement benefits.

Health Care

Active-duty military personnel, and their spouses and other dependents, are eligible for full health care coverage. Most treatment is provided through the government's own network of military hospitals and clinics, but a wide range of options is available through the military health care system, which is administered in a manner similar to that of a civilian health maintenance organization. Many members of the reserves are eligible to buy separate government-subsidized health insurance plans, and they receive full health care coverage when mobilized for active duty.

Survivor and Disability Benefits

Service members can buy government-subsidized life insurance, and survivors of service members who die on active duty are eligible for survivors' pensions and other monetary benefits. Service members with service-connected disabilities are eligible for disability payments administered through the Department of Veterans Affairs (VA).

Subsidized Retail Privileges

Service members are eligible to shop at *commissaries* and *exchanges*, which provide economical and tax-free shopping options for service members, particularly those assigned to isolated posts. Commissaries are similar to civilian grocery stores, while exchanges sell general goods, with larger exchanges carrying a selection similar to a civilian department store.

Retirement Pay and Other Retirement Benefits

U.S. service members become eligible to receive retirement pay after they have completed 20 years of

service, with increased pay for members who complete 30 years of service. Retirement pay is administered by the Department of Defense rather than by the VA and is legally and administratively considered to be reduced pay for reduced service—similar to a retainer payment—rather than an actual retirement pension. Military retirees may also participate in the military health care system.

Tax Advantage

Certain categories of U.S. military pay (including the *basic allowance for subsistence* and the *basic allowance for housing*) are exempt from taxes, creating a substantial tax advantage for service members who receive them. Somewhat confusingly, however, this tax advantage is technically classified by the U.S. government as a component of pay rather than as a benefit.

Administration of Benefits

Although some countries distinguish between military benefits and veterans' benefits, the only fundamental distinction between the two in the United States is administrative: the VA administers veterans' benefits, while the Department of Defense administers military benefits, including retirement pay and retiree health care.

BENEFITS, VETERAN

Offering veterans' benefits to citizens for military service is a long-established practice in the United States. At different times, benefits have ranged from medical assistance, pensions, loans, educational and vocational assistance to psychological counseling and preferential treatment in federal hiring practices. Veterans' benefits have generally been offered as a reward for military service, an inducement to enlist, a recognition that military personnel are asked to risk their personal well-being, and as an acknowledgment that veterans have been denied opportunities for personal advancement by being removed from civilian life. But the provision of veteran benefits has been far from automatic; both the nature and the generosity of the benefits offered has been conditioned by factors such as the economic health of the nation, differing ideologies about citizenship and military service, and the influence of veterans' lobbies. This entry examines the history of veterans' benefits in the United States, focusing on legislation passed to assist returning servicemen and service-women and their dependents (especially widows and orphans).

Early Veterans' Benefits

From America's founding, colonial legislators followed the English precedent of offering benefits to civilians to encourage service in colonial militias for duties such as frontier defense. This tradition continued as the colonies moved toward independence. Just over a month after the signing of the Declaration of Independence, the threat posed to Americans' security by the British during the Revolutionary War prompted the Continental Congress to draft the first national veterans' benefits law. The initial legislation—instigated to boost enlistment and morale—promised pensions to soldiers disabled during service in the Continental Army. This law established the precedent that the government has an obligation toward disabled veterans. Under this law, veterans would receive half of their pay if injured during service. Clearly, an injured veteran suffers a disproportionate burden of the national defense, and down to the present day, the need to provide disability assistance remains among the most widely accepted form of veterans' benefits.

Far more contentious was the legislation that soon followed that expanded veterans benefits to include pensions to able-bodied veterans and soldiers' dependents. Initially, all soldiers received mustering out pay, while a May 1778 law provided officers of the Revolutionary War a pension of half pay for 7 years. Two years later, the Continental Congress extended this benefit for life. In 1816, Congress established the precedent of providing for veterans dependents when it extended pensions to widows and orphans of the War of 1812 at the rate of half pay and for a period of 5 years. The liberalization of veterans' benefits was not without opposition. Thomas Jefferson and many of his supporters were apprehensive about the corrosive effect on the nation's moral character of offering pensions and payments to nondisabled veterans. To them, the virtuous citizen-soldiers who won the Revolution required no recompense for performing their civic republican duty.

Civil War Era

Although objections would resurface many times in the debates over veteran benefits that followed, the rewards tended to become more liberalized throughout the 19th century. The 1832 Service Pension Act, for example, provided pensions to veterans even when there existed no obvious financial or physical need. After the cannons fell silent in 1865, the government had the problem of how to deal with nearly 2 million Civil War veterans. The past three decades of the 19th century saw an unprecedented expansion of the veterans' benefits system. Union veterans—Confederate veterans received no federal recognition—received pensions under the 1862 General Pensions Act and were given preferential treatment for land grants under the 1862 Homestead Act. Disabled Union soldiers received disability compensation at a rate determined by their rank and the degree of their disability. For the first time, veterans also gained preferential treatment when applying for federal employment. Injured and disabled veterans also received medical care through the National Home for Disabled Volunteer Soldiers.

The expansion of benefits after the Civil War did not always occur in response to veteran hardship as veterans organizations began to exert considerable influence on legislation. The powerful veteran lobby group the Grand Army of the Republic pressured

Congress to pass legislation such as the Dependent Pensions Act of 1890. Under this act, veterans could claim disability pensions even if they did not incur the disability while on active duty. The act, therefore, offered what amounted to an old-age pension scheme for veterans as their health deteriorated later in life. Such acts meant that the burden of caring for veterans fell more heavily on the government than at any time previously.

The expansion of benefits also came at enormous financial cost. By the mid-1890s, veterans' benefits accounted for almost 43% of the government's total expenditure. The cumulative weight of veterans' legislation meant that at a time when the United States was rejecting European-style socialism to combat the inequalities of industrialization, veterans were becoming a privileged class relative to their nonveteran peers. As Theda Skocpol notes in *Protecting Soldiers and Mothers: The Political Origins of Social Policy in the United States* (1992), the concept of rewarding veterans was more palatable to a "Gilded-Era" mind-set because veterans had *earned* their benefits as opposed to the European model of providing a social safety net to those in need simply by virtue of them being citizens.

World War I

At the outset of World War I, the War Risk Insurance Act of 1914 offered federally backed insurance for America's shipping fleet and personnel. Following America's entry into the war in 1917, the Life Insurance Act was amended to include America's 4.5 million World War I veterans. The government also offered veterans vocational training for the first time to help compensate for time away from civilian life—time that could have been spent developing skills for employment or advancing civilian careers. Both benefits would feature heavily in future veterans' legislation.

But the most contentious veteran benefit—and the cause of one of the most tumultuous episodes in the history of veteran benefits—was the proposed bonus payment. The 1924 World War Adjusted Compensation Act promised veterans a life insurance payment that would be due in 1945. Though passed in an era of relative economic prosperity, President Warren Harding raised the old Jeffersonian warning of the dangers of the bonus on the nation's moral fiber. He vetoed the bill, arguing that the government

did not have any significant financial obligation to able-bodied veterans who were merely performing their civic duty. Extraordinarily, he even implied that the joys of military service were sufficient reward when—in vetoing the bill—he claimed that World War I veterans “emerged from the great conflict not only unharmed, but physically, mentally and spiritually richer for the great experience” (Daniels, 1972, p. 29). Harding’s objections notwithstanding, Congress overrode his veto, and veterans looked forward to receiving their bonus in 1945.

However, as a consequence of the financial hardships brought on by the Great Depression, thousands of veterans marched on the nation’s capital in 1932 requesting early payment of the bonus. Many of the so-called Bonus Army set up camp on Washington’s Anacostia Flats, notoriously prompting President Herbert Hoover to send in the army using tanks, tear gas, and brute force to evict them. In his first term, Hoover’s successor Franklin D. Roosevelt was hardly more of a friend to the veteran. One of his first acts as president was to pass the Economy Act, which slashed veterans’ benefits with a view to redistributing the funds to needier sectors of society. It took a congressional override of Roosevelt’s veto in 1936 to secure the payment of the bonus to World War I veterans. Congress also set about streamlining the benefits system, and in 1930, it consolidated the three existing veterans agencies—(1) the Bureau of Pensions, (2) the Veterans’ Bureau, and (3) the National Home for Disabled Volunteer Soldiers—into the Veterans Administration (VA). Thereafter, the VA would be responsible for administering services such as medical and domiciliary care, pensions, and disability and education benefits. Frank T. Hines, a veteran of the Spanish-American War and World War I, headed the agency from its inception until 1945.

World War II

World War II led to an unprecedented number of veterans entering American society, and—as happened after the Civil War—veterans’ lobby groups played a significant role in determining how the government would treat them. After the harrowing experience of the Bonus Army, and with growing fears that World War II veterans would come home to unemployment lines, the government began early planning for their return. Early-World War II

legislation provided for life insurance, mustering out pay, and guarantees that their old jobs would be there for them when they left the service. The 1943 Disabled Veterans Rehabilitation Act offered vocational rehabilitation services for wounded World War II veterans. Some 621,000 veterans received assistance under this program. But the capstone legislation—and one of the most important pieces of legislation passed in the 20th century—was the 1944 Servicemen’s Readjustment Act, or “G.I. Bill of Rights.”

More than 600 different proposals for veterans’ legislation circulated around Capitol Hill before 1944. Most proposals—including those supported by the Roosevelt administration—favored the concept of offering training and education over a direct financial handout. The idea of benefits that allowed self-improvement for the veteran seemed more in keeping with America’s individualistic ideals as opposed to the wealth redistribution nature of cash bonuses. But in January of 1944, the veterans’ group the American Legion released its own proposal for rehabilitating veterans, which it termed a “Bill of Rights for G.I. Joe and G.I. Jane.” Comprised mainly of World War I veterans, the legion wanted to ensure that the next generation of veterans would be treated better than their own. Their proposal called for unemployment insurance, funding for education, vocational training, and home loans. Spurred on by a media lobbying campaign by the legion, Congress debated the legion’s plan and reached widespread accord on its main tenets. The G.I. Bill of Rights passed rapidly through both legislative houses and was signed into law by Roosevelt on June 22, 1944.

In its final form, the 1944 G.I. Bill offered veterans unemployment insurance at the rate of \$20 a month for 52 weeks—creating what was popularly known as the “52–20 Club”—and low-rate loans for homes or to invest in farming or businesses. But the G.I. Bill is perhaps best known for the education benefits offered to veterans. The bill provided veterans with a monthly living stipend and paid their tuition up to \$500 a year—enough to cover even the most expensive American colleges. Veterans needed to have served only 90 days and to have left the service in good standing. More than 2.2 million veterans entered higher education under the bill, swelling college enrollments and changing the nature of higher education.

Historians and politicians have widely credited the 1944 G.I. Bill with expanding the nation's middle class and contributing significantly to America's postwar prosperity. Not every veteran shared in the benefits equally, however. Minority veterans were still denied access to many institutions of higher education, while some African American veterans—particularly in the South—found difficulty in claiming their benefits when confronted by prejudiced local administrators.

Cold War and Vietnam Era

The 1944 G.I. Bill seemed to have provided a widely agreed on model for veteran benefits as Korean War veterans received similar rewards with little debate in 1952. The main difference in the 1952 bill was that the VA paid money for tuition directly to the veteran instead of to their school—a change prompted by a congressional investigation into the 1944 bill that found that some schools were raising tuition to maximize the money received from the government.

But Congress began to scrutinize more closely the provision of liberal veterans' pensions by the late 1950s. In 1956, a presidential commission on veterans' benefits—headed by the decorated general Omar Bradley—recommended that the government scale back its obligation to able-bodied veterans to meet the enormous costs of providing for America's Cold War draft army. This led Congress to pass the Veterans' Pensions Act of 1959—over the vociferous objections of veterans' organizations—which more closely tied pension rates to a veteran's income and financial needs.

The same air of economic restraint engendered by the Bradley Report infused debates over the 1966 G.I. Bill. Initially, the education benefits provided by this bill proved to be far less generous than the previous G.I. Bills. Several reasons accounted for this retrenchment. Fiscally conservative politicians—such as Texas Democrat Olin Teague—argued that education benefits ought to provide veterans *some* assistance, but not the full ride that World War II veterans had enjoyed. Second, the bill covered all Cold War veterans whether or not they served in a combat zone or in a time of declared war. Because this broad designation covered so many veterans—many of whom might have suffered no real hardship from service—the benefits were set at a lower level than for previous G.I. Bill recipients who had served

in times of war. This decision to reward peacetime veterans further transformed the nature of veteran benefits. Civilians could now potentially enlist in the military with the expectation of future reward without the likelihood of combat service. A third factor reducing the amount of benefits offered was Lyndon Johnson's desire to redirect federal spending to more universal Great Society programs such as the Higher Education Act. Finally, Johnson's determination to minimize the domestic impact of the war early on led him to oppose a G.I. Bill as generous as the World War II or Korean bills because he did not yet want to cast the Vietnam War as a similarly full-blown conflict. As a consequence of the lower education benefits, many Vietnam combat veterans felt short-changed by the government when they returned home. Johnson's fiscally conservative successors did little to help their situation thereafter as both Richard M. Nixon and Gerald R. Ford fought against meaningful increases in educational allowances.

Vietnam veterans faced a similarly drawn-out battle to obtain federal assistance for their psychological needs. Throughout the 1970s, there were increased reports of Vietnam veterans suffering emotional trauma as a result of their service. Concerned veterans and some psychologists pushed Congress for the enactment of laws providing for clinical assistance. Yet, repeatedly, their pleas fell on deaf ears as some lawmakers—including aging World War II veterans such as Olin Teague in the House—refused to acknowledge any special needs on the part of Vietnam veterans. Not until 1979 did the government begin a program of outreach centers to help afflicted veterans. In 1980, the official recognition of posttraumatic stress disorder in the mental health community's guiding document *Diagnostic and Statistical Manual* (3rd ed.; *DSM-III*) led to a more formal acceptance of postservice counseling as a necessary part of the government's obligation to its soldiers thereafter.

All-Volunteer Force

After the United States moved toward the all-volunteer force in 1973, the justifications for veterans' benefits altered somewhat. Since 1940, the United States had relied predominantly on a draft army to meet its military manpower needs, and previous benefits had been offered, in part, to compensate draftees for the time they were removed from civilian life.

Now that the nation's military was to rely on volunteers, offering benefits became a vital way of enticing civilians into service. Because the recipients of benefits after 1973 were now volunteers, early education programs were less generous than the previous G.I. Bills. Legislators presumed that enlistees were making informed career choices by joining the military and did not need generous compensation for service. All-volunteer force programs such as the Veterans Education Assistance Program required veterans to contribute their own money into an education fund. The government would then match the amount at a ratio of 2:1. Initially, participation in all-volunteer force programs was low and the military was falling short of its recruitment goals. These shortfalls prompted the passage of the Veterans' Educational Assistance Act of 1984. More commonly known as the Montgomery G.I. Bill after the bill's architect Mississippi democrat Gillespie V. "Sonny" Montgomery, the bill resembled previous iterations of the G.I. Bill by offering veterans tuition payment and monthly living stipends. The 1991 "Gulf Act" liberalized the Montgomery G.I. Bill benefits for veterans of the 1991 Persian Gulf War.

Veterans serving in the U.S. Global War on Terrorism and beyond received a new G.I. Bill, which was signed into law in July 2008 and went into effect in August 2009. The architect of the "Post-9/11 Veterans Education Assistance Act of 2008," or "Post-9/11 G.I. Bill," Democratic senator Jim Webb intended the legislation to cover most of the educational costs of veterans similar to the World War II G.I. Bill and, indeed, the bill soon became one of the most extensive and generous of the G.I. Bills passed since 1944. Beginning in 2009, the bill provided assistance to all veterans who had served at least 90 days since September 10, 2001. Most veterans earned up to 36 months of entitlements and could claim their benefits up to 15 years following discharge. The benefits covered tuition up to the equivalent of the cost of an in-state public institution degree, and the tuition was paid directly to the veteran's school. Post-9/11 veterans could also claim housing benefits and up to \$1,000 for books and supplies under the new bill. Furthermore, funds could be made available to veterans attending a school whose tuition was more expensive than the veterans' earned allowance: If schools signed up for the Yellow Ribbon program, the VA would provide matching funds to cover the difference in tuition

rates. More than 770,000 veterans had taken advantage of the Post-9/11 G.I. Bill by the conclusion of its first 3 years. Despite the successes and widespread praise for the Post-9/11 G.I. Bill, the historical battles over veterans' benefits suggest that the future treatment of the nation's veterans will continue to be subject to economic and political whims.

BLACKWATER

Blackwater USA, renamed Blackwater Worldwide (2007), rebranded as Xe Services LLC (2009), and most recently renamed Academi (2011), is the world's largest, most powerful, and best known private security/military company (PSC/PMC), offering manifold services (above all, military training, security guards and patrols, intelligence, and consulting) to both government and private clients. It has been emblematic of the character, developments, and consequences of the outsourcing of war and security. This entry discusses the origins of Blackwater, its subsidiaries and facilities, the role of Blackwater in the Global War on Terrorism and as a U.S. government contractor, and controversies and accusations.

The Beginnings

Blackwater USA, headquartered in Moyock, North Carolina, began as a private military training facility. The idea of incorporating enterprise for training government and private customers was born among a group of Navy SEALs (Sea, Air, and Land Teams). Although the inspiration came probably from Al Clark, it was Erik Prince, a radical right-wing Christian activist, a supporter and subsidizer of the Republican Party, and a multimillionaire, who provided the money, thus becoming the founder and chairman of the company. They and Gary Jackson sought to use post-Cold War military downsizing, which had deteriorated training infrastructure and capabilities, to their advantage. In December 1996, Prince incorporated Blackwater Lodge and Training Center, which opened for business in May 1998. The company's name was inspired by the black waters of the Great Dismal Swamp of North Carolina; it was close to there, in Moyock, on more than 6,000 acres of land, that Blackwater built the world's largest and most all-inclusive commercial security training complex.

It was soon training law enforcement personnel and civilians in the use of various types of weapons, regularly hosting a police and military handgun competition (Shoot-Out at Blackwater), leasing out its camp (frequently to the SEALs), and training special weapons and tactics police teams at its "R U Ready High School" mock facility for simulated school shootings.

In February 2000, Blackwater received its first, 5-year General Services Administration contract, which created a list of services it could sell to federal agencies (by 2006, this brought the company \$111 million). However, the first crucial military contract came following the al Qaeda attack on the USS *Cole* in October 2000, after which the U.S. Navy realized the need to train sailors for combating terrorist threats. With a \$35.7 million contract, it hired Blackwater to train some 16,000 sailors in force protection, shipboard security, search-and-seizure techniques, and armed sentry duty. In September 2001, the company won a Federal Bureau of Investigation contract and promptly grew into the prime training provider for various wings of the government, including not only the Department of Defense (DOD) but also departments such as Energy and the Treasury. The company, with significantly growing profits, built a solid market position, became well connected with the federal structures of government, and began expanding its focus and range of services.

The Structure

Over the years, Blackwater set up operating divisions or subsidiaries as follows:

1. Blackwater Lodge and Training Center (now, U.S. Training Center, including a number of live-fire shooting ranges, mock-ups of urban settings, an artificial lake, and a naval ship; since 1998, it has trained hundreds of thousands of U.S. government personnel and allied forces)
2. Blackwater Security Consulting (incorporated in 2002 and specializing in security services)
3. Blackwater Target Systems (created in 2002 to provide solutions, design, construction, and maintenance of training ranges and shoot house systems; the company patented, e.g., the BEAR multitarget training system)
4. Blackwater Air (established in 2003 with the acquisition of Aviation Worldwide Services and

- its subsidiaries, such as an air carrier, Presidential Airways, specializing in out-of-the-ordinary air transportation services)
5. Blackwater Canine (training and deployment of narcotic- and explosive-detecting dogs)
 6. Blackwater Armored Vehicle (an R&D company, whose major achievement is Grizzly—an improvised explosive device–safe armored personnel carrier for urban combat)
 7. Blackwater Maritime (containing a fleet of naval and maritime equipment and simulation devices for training, support, and antipiracy/antiterrorist security)
 8. Greystone Limited (an affiliated company incorporated offshore in 2004 in Barbados, classified by the U.S. government's Central Contracting Office as a "tax-exempt corporate entity" specializing in "security guards and patrol services")
 9. Raven Development Group (a construction subsidiary, which built the Moyock training center, developed into a mobile provider of construction and real estate services)

The Blossoming: The Global War on Terrorism

At the turn of the 21st century, Blackwater was well established and ready to expand its profile. The goldmine opportunity came with the September 11, 2001, attacks and the Bush administration's neo-liberal objective of outsourcing security. In 2003, Blackwater Security Consulting obtained its first high-profile, 11-month contract for protecting the head of the Coalition Provisional Authority, Paul Bremer. The company assigned almost 40 bodyguards and air transportation services through Boeing helicopters.

In March 2004, in cooperation with the Kuwaiti firm Regency Hotel and Hospital Company, Blackwater won a contract with Eurest Support Services, a subcontractor to Kellogg Brown & Root, which had a deal with the U.S. Army to provide the troops in Iraq with logistical support such as meals and laundry. Blackwater was to guard kitchen equipment transports. On March 31, 2004, in Fallujah, one of the convoy teams ran into a fatal ambush, in which insurgents not only killed the four contractors but also mutilated and burned their bodies. Two desecrated corpses hanging from a bridge over the

Euphrates drew wide media coverage. The gruesome images came to be one of the iconic pictures of the war in Iraq, while the incident made public the role the PSCs had already played in combat. The tragic incident, known as the "Blackwater bridge," not only prompted the American siege of Fallujah (on April 4, 2004, more than 1,000 U.S. Marines were deployed in Operation Vigilant Resolve) but also, ironically, proved to be the springboard for the company's future prosperity. An influential Washington lobby company, Alexander Strategy Group, helped capitalize on the infamous ambush, and in June 2004, Blackwater won a valuable (\$300 million) and prestigious international security contract. Under the Department of State's Worldwide Personal Protective Services (WPPS) program, it was hired to guard U.S. diplomats, notably Paul Bremer and the then ambassador John Negroponte, other officials, and American facilities—the embassy in Baghdad and five regional occupation headquarters. Of the three PSCs to receive the WPPS contracts (the other two being DynCorp and Triple Canopy), Blackwater got the greatest share. Under this deal, as of May 2008, it had 1,090 contractors worldwide (out of 1,574), including 698 in Iraq (out of 1,400). Originally, Blackwater was assigned \$229.5 million; however, in 2005, it won the second WPPS contract (for 1 year but annually renewed, last time in 2008), and by only September 2006, it was estimated to have accrued \$337 million.

Blackwater ran about 60 convoys a week in central Iraq. It started out employing former U.S. Special Forces soldiers, ex-GIs, and retired police officers, but the dramatic increase in the demand for private security services made it recruit foreigners as well. In 2004, 20% of its contractors were not U.S. citizens (controversially, it had a sizeable group of Chilean soldiers, many of whom had served under the Pinochet regime, later to be replaced with considerably cheaper Bosnian, Colombian, Filipino, and Jordanian recruits), while 30% lacked a formal military training. An employee with Blackwater could earn on average \$500 to \$800 a day, but sometimes much more, while the contracts were generally short term (usually for 2 months), yet extendable.

The WPPS contract turned the firm into something of a Praetorian Guard in Bush's Global War on Terrorism. It made it an essential player in U.S. operations, brought enormous profits, attracted new clients, and won fame (and infamy). The company also

secured contracts to train Iraqi police and military forces as well as Afghan troops. Soon, it expanded its services in Afghanistan, where it provided protection to the Central Intelligence Agency (CIA) station in Kabul, while its Presidential Airways, under the \$34.8 million contract with the U.S. Air Force, performed “short takeoff and landing” flights. After one of its planes crashed with U.S. soldiers onboard, the investigations undertaken by both the army and the National Safety Board revealed severe violations of safety regulations. Later, the families of the three soldiers killed sued Blackwater for wrongful deaths. The accident became one of the many heated controversies soon to flare up over the company’s (mis) conduct.

The Global War on Terrorism has turned out to be a remarkable business for the PSCs. Although it is hard to estimate how much profit Blackwater made on government contracts, in 2001–2007 it must have been more than \$1.5 billion, excluding urgent orders and lucrative “black” (secret) contracts with the CIA. It is likely that in the period 2001–2011, the agency awarded up to \$600 million in classified deals to Blackwater. According to unconfirmed but plausible reports, in 2004, it was hired to locate and kill Taliban and al Qaeda operatives, assist in the transportation of detainees, and conduct “snatch and grab” operations—that is, the clandestine night raids with agency officers against suspected insurgents in Iraq and Afghanistan.

Additional Services for the Government

Standing firmly in the security services market, the company was searching for new business opportunities, and it was employed to secure U.S. interests in the oil and gas-rich Caspian Sea region. In July 2004, the DOD contracted Blackwater to train an elite Azeri force modeled after the Navy SEALs and to set up a training center/military base in Baku.

In August 2005, Hurricane Katrina opened the home market for Blackwater’s deployment. Immediately after the disaster, the first heavily armed contractors arrived in New Orleans, largely destroyed and plunging into chaos and violence. They not only guarded private firms, banks, hotels, and wealthy inhabitants but also, under a contract with the Department of Homeland Security’s Federal Protective Services, secured the governmental reconstruction works. By June 2006, Blackwater received

about \$73 million for its post-Katrina services, earning some \$243,000 a day. Encouraged by this rewarding opportunity, the company commenced seeking contracts with local governments in other U.S. states.

In August 2007, along with four other PSCs, Blackwater won the biggest deal ever. Worth up to \$15 billion, it was a 5-year counternarcotics training contract with the DOD’s Counter-Narcoterrorism Technology Program Office.

The Twilight of the Number One PSC?

In Iraq, Blackwater’s contractors, by conducting their duties recklessly and rather aggressively, made enemies, which jeopardized U.S. counterinsurgency efforts. They often engaged in battles with insurgents, and it is difficult to classify the character of their activity because sometimes it resembled a police special weapons and tactics-type of operation, while on other occasions it came close to a military special operations-like action. This was the case, for example, with the April 2004 defense of the U.S. headquarters in Najaf against hundreds of Iraqi insurgents: Before the U.S. Special Forces arrived, eight Blackwater personnel were sent into action and succeeded using various methods, relying on a helicopter to resupply the forces with ammunition and transport a wounded marine. Because the way they fought off insurgents was hardly distinguishable from combat, the company had the highest shooting incident rate among all PSCs operating in the country. From January 2005 to September 2007, it was involved in 195 incidents of open fire, with the contractors shooting first on 84% of occasions. The crossover point came with the incident on September 16, 2007, when the Blackwater guards escorting a diplomatic convoy opened fire at the Baghdad traffic circle in Nisoor Square, killing 17 Iraqi civilians and wounding 24. The investigation concluded that the shootings were not justified. The Iraqi government claimed greater control over foreign contractors and their subjection to the local law. On the U.S. side, the government sought to impose tighter scrutiny on Blackwater’s activities. In October 2007, the State Department announced that it was assigning its own diplomatic security service agents to monitor all of the company’s security convoys in Iraq and installing video cameras in its vehicles. Finally, the Iraqi government refused Blackwater an operating license,

and in May 2009, the company ceased its activities in the country; its assignments were taken over by its competitors: Triple Canopy and DynCorp. The Nisoor Square incident cost Blackwater a profitable presence in Iraq and its reputation.

Controversies and Accusations

Among the gravest charges against Blackwater, many still under investigation, have been murder and manslaughter, conspiracy, corruption, tax evasion, false statements, violations of U.S. arms export control regulations, and using shell companies to secure contracts without being recognized as Blackwater (more than 30 such firms were created, and at least three of them concluded deals with the U.S. military or the CIA).

In 2005, the families of the four contractors killed in Fallujah in March 2004 filed a suit for wrongful death against Blackwater, alleging that the company failed to provide basic security to its employees (the contract with ECC required at least three men per vehicle on security missions, while only two were sent; they had no map and were traveling in unarmored vehicles). This lack of preparation, resources, and support for its personnel were also the findings of the Congressional Committee on Oversight and Government Reform. Blackwater countersued the families for \$10 million, claiming that they violated the contracts of their relatives, which forbid any suit against the company. In 2011, a federal court dismissed both cases after no progress was achieved in court-ordered arbitration.

At the end of 2009, the Department of Justice opened an inquiry into whether Blackwater sought to bribe Iraqi government officials, as there had been leaks that the company authorized secret payments of about \$1 million to buy permission to continue its work in Iraq following the 2007 incident.

In April 2010, federal prosecutors announced weapons charges against five former senior Blackwater executives, including its ex-president, Erik Prince. In August, the company reached a settlement with the State Department, agreeing to pay \$42 million in fines for the violations of the U.S. export control regulations (e.g., for illegal export of weapons to Afghanistan and Iraq and sniper training for Taiwanese police officers). The deal enabled it to continue competing for government contracts.

Although just before leaving Iraq in June 2004, Paul Bremer issued Order 17, which immunized contractors from prosecution in Iraq, some of Blackwater's men faced trial in the United States. In December 2008, five were charged with manslaughter at Nisoor Square in 2007. Burdened by legal obstacles, the cases were dismissed in 2009 by a federal judge in Washington, D. C. Nevertheless, in April 2011, a federal appeals court reopened the criminal case against four ex-Blackwater personnel. While their process continued, another former contractor was sentenced to 2½ years in prison for shooting an unarmed Afghan civilian in Kabul in 2009, becoming the first Blackwater former contractor to be sentenced for criminal offense.

Last but not least, the argument for the cost-effectiveness of PSCs proves to be highly dubious. According to the Congressional Committee on Oversight and Government Reform, Blackwater costs were 4 to 10 times higher than the costs of a U.S. soldier. The corporation charged the government \$1,222 per day for each contractor—over six times more than the salary of a serviceman. Even after adding the expenditures of training, housing, feeding, and arming a soldier, the PSCs turn out to generate not savings but greater cost to the U.S. federal budget.

Avoiding the Decline: Mock Changes or Real Transformation?

In February 2009, with both the WPPS contracts lost and the firm's good standing gone, Blackwater Worldwide changed its name to "Xe Services"; moved its headquarters to Arlington, Virginia; and went into rebranding its corporate structure. The company announced the reorganization of its units, the institution of a corporate governance and ethics program, and the setting up of an independent outside committee to supervise its structures and activities.

With the coming of the Obama administration, Blackwater invested extensively in lobbying (e.g., in the first quarter of 2010, it spent more than \$500,000 for a well-connected Democratic lobbyist, Stuart Eizenstat). This paid off because despite all the controversies and investigations for a range of alleged violations and crimes, under the new administration, Xe was awarded a \$250 million contract to provide the Department of State and the CIA security services, particularly in Afghanistan. Thus, Blackwater/Xe

operatives continue to be involved in the most sensitive U.S. missions. In August 2011, Xe received a DOD contract valued at \$17.6 million to provide intelligence expertise for its Counter-Narcoterrorism Technology Program Office's activities in Afghanistan. Contracting out has become such an inherent and indispensable feature of the American way of war that, although the Obama administration has not been enthusiastic about continuing the cooperation with Blackwater/Xe, it turned out that the United States cannot do without it.

Erik Prince stepped down as the chief executive, and in late 2010, he sold the company and moved to the United Arab Emirates. In July 2011, Jack Quinn, the former White House counsel to President Bill Clinton and the former chief of staff to Vice President Al Gore, became an independent director of Xe. USTC Holdings, the investor consortium that acquired Xe Services, aims to recast the company as a military training firm and move its focus away from the business of private security for which it has earned a bad reputation. Xe wants to obtain contracts for training local forces in Iraq, Afghanistan, Yemen, and elsewhere. It remains to be seen, however, whether this return to the initial area of Blackwater's specialty and the intentions to enhance "governance, leadership, accountability and transparency" will be a true corporate transformation or merely a cosmetic exercise.

Conclusion

The success story of Blackwater is in some ways an exemplification of the American dream—over one decade a little and unknown firm operating a training facility established itself as the government's largest go-to private partner in its war on terror. The firm reached its peak as the most powerful PSC in the world in 2006, having some 2,300 employees disposed in 9 countries and a database with an additional 21,000 contractors ready for immediate deployment, the most sophisticated private military camp and two new facilities under construction ("Blackwater North" in Illinois, and in the Philippines, for jungle training), a vast stockpile of heavyweight weaponry, an armada of more than 20 aircraft (both simple carriers and gunships) and a ship, its own intelligence and surveillance division, and advanced R&D and manufacturing capabilities (unmanned aerial vehicles, armored carriers, and a surveillance blimp). In March 2006, at a conference in Jordan, Blackwater's vice chairman, Cofer Black,

announced that it was ready to provide a private brigade-size force for a conflict/crisis zone. He concluded that the company was prepared to shift from security services to a more "overt combat role," becoming an army for hire. Although the executives would later deny this claim, Black's often quoted declaration was the best evidence of Blackwater's might.

Although its standing is damaged, Blackwater/Xe accomplished the goal articulated by Erik Prince: It has done "for the national security apparatus what FedEx did to the postal service" (Scahill, 2011, p. 439). Overall, it has become iconic for the emergence of the outsourced corporate violence industry in the post-Cold War era, with all its pros and cons.

BLITZKRIEG WARFARE

Blitzkrieg, the doctrine of war employed by Nazi Germany in the opening years of World War II, was the result of years of strategic and operational thinking. Marked by the experience of World War I, Germany sought a doctrine that would enable domination of

Europe through mechanized warfare. Because of its high demand on resources, blitzkrieg proved unsustainable, and the Allies learned to counter the initially successful doctrine. This entry traces the history of the type of warfare called blitzkrieg, and discusses the debate among historians as to the efficacy and even the existence of blitzkrieg. Despite its renown, some revisionist historians argue that blitzkrieg is overrated or may never have existed at all.

Development and Implementation

As defined by traditionalist historians, *blitzkrieg*, German for lightning war, describes an operational doctrine involving the use of constant motion and motorized force concentration to break through lines and proceed to the enemy flank. Blitzkrieg involved the use of wide sweeps of motorized artillery to immobilize and trap enemy forces and dislocate enemy command and control. Designed for quick victory, blitzkrieg was meant to keep the enemy off balance by speed and surprise. In comparison to the long stalemates of World War I, blitzkrieg undertook to defeat entire armies in weeks instead of years. The war of movement, as opposed to position, was favored by the German leadership who wanted neither a long nor an expensive war.

Blitzkrieg doctrine emerged from the interwar period as a combination of new technology and German military tradition. The use of aircraft and tanks in concert complemented long-held traditions such as a flexible command doctrine, prejudice against intellectual one-sidedness, and a positive attitude toward operational planning. Influenced by the experiences of the Condor Legion during the Spanish Civil War, blitzkrieg was designed to use air power as a support to the army. The use of radio by the field army assisted in maintaining close cooperation in short, mobile wars. Tanks, infantry, artillery, and air power were used by the Germans to great effect in the early years of World War II.

From 1939 to 1941, blitzkrieg was used most effectively during the invasion of Poland and the Battle of France. The invasion of Poland began on September 1, 1939, and Warsaw fell on September 27. Deployed in Army Groups North and South, the German army encircled the Polish army advancing from Pomerania, Slovakia, and Silesia, and killed 65,000 Polish men. In the Battle of France, the German invasion of France and the Low Countries began on May 10, 1940. German armored forces

crossed the Ardennes, broke the Maginot Line, and occupied Paris on June 14. Outside Europe, German commander Erwin Rommel used blitzkrieg during desert campaigns in North Africa.

Allied Responses

Despite the initial utility of blitzkrieg in Poland and France, the Germans were not able to sustain their success. Larry Holbrook Addington posits that blitzkrieg, despite its innovation, rested on traditions of offensive posturing and capturing land and was not capable of victory against continental or insular powers such as Russia or Great Britain, respectively. Blitzkrieg became unsustainable because of its short range, resource consumption, and reliance on surprise. By 1943, the balance of fire and air power shifted to the Allies, though the Germans retained a qualitative advantage. The Allies responded by increasing mobility and mimicked blitzkrieg tactics. Most notably, U.S. general George Patton used blitzkrieg-style tactics in European operations of 1944.

Strategic miscalculations and planning failures on the part of the Germans greatly assisted the Allies. Overreach in North Africa was complicated by severe oil and gas shortages that made blitzkrieg impossible. Tank and tractor shortages were also made worse by Allied interdiction efforts in Europe to destroy rail networks. Ultimately, Germany was too small, with too few people, too small an industrial base, and too little materiel (military equipment, supplies, etc.).

The Soviets were most effectively able to counter blitzkrieg. The Germans did not possess antitank capability or doctrine and were unable to counter Soviet armor. Soviet encirclement and deep battle theory strove to inflict a decisive strategic defeat and render the defense of the front impossible. Soviet tactics forced the Germans to rely on fortification and linear defense, rendering the mobility required for blitzkrieg impossible. Ultimately, the combination of Russia's sheer size and Russian weather and manpower prevented the Germans from being able to encircle and contain enemy forces. Inadequate supplies and reinforcement shortages sapped German morale, and the German invasion of Russia failed.

The Blitzkrieg Controversy

Despite its fame and worldwide influence on modern combined arms warfare, revisionist historians disagree with regard to the efficacy of blitzkrieg, and

about whether blitzkrieg ever existed. Historians such as Matthew Cooper and Richard Overy argue that blitzkrieg is a poorly defined myth, originating from a 1939 *Time* article that erroneously assumed German attacks early in World War II to be part of a new theory of war. J. P. Harris argues that operational and strategic thinking in Germany had changed little in the interwar period, as the hectic rearmament period left little time for innovation. Instead, critics attribute rapid success in the opening years of World War II to higher levels of mobilization compared with the Allies. The term *blitzkrieg* was not used as part of the official German doctrine, and appears in few historical documents from Germany. Hitler had been looking to awe his enemies with quantitative superiority, not with qualitative improvements and revolutionary tactics. However, the myth of Hitler as the Nazi genius commander responsible for blitzkrieg was propagated following 1940 by the Nazis and the Allies alike. German generals undoubtedly employed tactics now associated with blitzkrieg, but it was by no means a top-down enforced doctrine.

BOEING

Founded in Seattle, Washington, in 1916 by William Edward Boeing, the Boeing Company is a world leader in commercial aircraft, as well as being a prominent builder of military aircraft and other defense systems. This entry traces the history of

Boeing military aircraft and missile systems and discusses current unmanned experimental aircraft.

History: Aircraft, Missiles, and Mergers

During the 1920s and early 1930s, Boeing's most important military program was the Model 100 fighter aircraft series, of which more than 550 were delivered to the U.S. Army as P-12 and the U.S. Navy as F4B. Prior to World War II, Boeing emerged as a world leader in four-engine commercial and military aircraft. Notable was the Model 299, which entered service in 1936 with the U.S. Army Air Corps (U.S. Army Air Forces, USAAF, after 1941) as the B-17 Flying Fortress. Through 1945, more than 12,000 B-17s were built. During World War II, they served with the USAAF in all theaters, especially in Europe, where they were a key weapon of the strategic bomber offensive that crippled the German war machine.

In 1943, Boeing began deliveries to the USAAF of the B-29 Superfortress (Model 345), the largest operational bomber of World War II. These were earmarked solely for operations against Japan, because the extremely long distances in the Pacific theater required a very long range bomber. During 1944 and 1945, the B-29s conducted a massive air campaign against industrial infrastructure targets in Japan. These operations culminated with two nuclear bomb strikes in August 1945, which hastened the end of World War II. More than 3,000 Superfortresses were built.

After World War II, the Boeing Company continued with large commercial and military aircraft, including the Model 707, the world's first successful commercial jetliner. The B-47 Stratojet (Model 450) was the first swept-wing strategic bomber delivered to the U.S. Air Force. More than 2,000 Stratojets were produced through 1956, more than any other American jet bomber type.

Boeing's huge B-52 Stratofortress (Model 464) bomber became the signature jet bomber of the U.S. Air Force Strategic Air Command during the Cold War. In 1957, B-52s demonstrated their range capability by flying around the world nonstop. Boeing built 744 B-52s through 1962, and Stratofortresses continue in frontline U.S. Air Force service in the 21st century. Having flown airborne alerts with the Strategic Air Command for more than three decades, B-52s have been used to deliver conventional ordnance in conflicts from Vietnam to Afghanistan.

Also, for the Strategic Air Command, Boeing developed the Minuteman intercontinental ballistic missile, which became fully operational in 1965 as part of the U.S. strategic deterrent force. At the beginning of the 21st century, more than 400 Minuteman intercontinental ballistic missiles were still deployed in silos (underground vertical structures that house missiles ready to launch) across the United States.

During the Cold War, the Boeing Company also built a number of important noncombat military aircraft. The Model 717, similar to the commercial 707, was adapted by the U.S. Air Force as the KC-135 Stratotanker refueling aircraft, which complemented the B-52 as a mainstay of the Strategic Air Command throughout the Cold War. Like the B-52, the KC-135 remains in frontline service in the 21st century. There were 820 Model 717 airframes built, 732 as KC-135s, and the remainder as C-135 transports, RC-135 strategic reconnaissance aircraft, and EC-135 airborne command post aircraft. In addition, 14 similar Model 739s became RC-135s.

The Model 707 airframe was also adapted for military uses, first as the VC-137 aircraft, the American presidential jet. Under the call sign "Air Force One," VC-137s served every American president from Dwight Eisenhower through George H. W. Bush. During the latter administration, they were superseded as Air Force One by Boeing Model 747 aircraft under the designation VC-25. Model 707 airframes were also adapted by the U.S. Air Force as Airborne Warning and Control System aircraft under the designation E-3, and by the U.S. Navy as airborne command posts as E-6. The 747 was adapted as a presidential command post under the designation E-4. The E-3, E-4, and E-6 remain in service in the 21st century.

In 1996–1997, the Boeing Company absorbed two other major manufacturers of military aircraft. Dating back to 1928, the North American Aviation component of Rockwell International had been responsible for aircraft such as the P-51 Mustang, the leading American fighter plane in World War II, and the F-86 Sabre, the leading American jet fighter of the Korean War. This entity was also responsible for the record-setting X-15 research aircraft and the Space Shuttle orbiting vehicle. Boeing also acquired McDonnell Douglas, itself formed by a 1967 merger of those two companies. Dating back to 1920, Douglas had built myriad military and commercial

aircraft types, notably its Douglas Commercial family of airliners. As such, Douglas had been Boeing's principal American competitor in the commercial market for many decades. The McDonnell component had become famous for building a successful series of Cold War-era jet fighters, especially the F-4 Phantom, and (after the merger with Douglas) the F-15 Eagle and F/A-18 Hornet. The C-17 Globemaster III heavy lift transport, which originated as a McDonnell Douglas program, evolved into one of Boeing's most important large military aircraft programs after the merger.

Also, through the merger with McDonnell Douglas, Boeing gained the helicopter company that had been Hughes Helicopters until 1984. The principal product of this division is the AH-64 Apache attack helicopter, which remains in production in the 21st century.

Since the mergers, Boeing has been active in a number of military programs. Among these was a competition with Lockheed Martin for the lucrative, multiservice Joint Strike Fighter program. The program called for a multirole combat aircraft, variants of which would be adopted by all the U.S. armed services, as well as by the United Kingdom and possibly others. The Boeing X-32 aircraft flew in competition with the Lockheed Martin X-35 during 2000–2001, but the latter was selected to enter production as the F-35. Boeing also developed the X-45 unmanned combat air vehicle, which first flew in 2002. Despite promising test flights, the program was cancelled in 2006.

Other 21st-century Boeing military programs include defensive missile systems and military variations on Boeing commercial airframes. Among these are an airborne laser adaptation of its 747 and an aerial tanker based on the 767, which is in service with the air forces of Italy and Japan under the designation KC-767 and has been ordered by the U.S. Air Force under the designation KC-46A. The 737 commercial airframe, meanwhile, has been adapted as the P-8 patrol aircraft and as the C-40 transport aircraft.

Recent developments on the commercial side include Boeing's Model 777 (aka "Triple Seven") jetliner, which entered service in 1995. With a range of nearly 11,000 miles, this large, twin-engine aircraft has proven popular with airlines operating on long-range intercontinental routes. The 777–200ER Worldliner variant established a world

nonstop distance record of 13,422 miles in 2005. In December 2009, Boeing marked the first flight of its Model 787 Dreamliner, a jetliner designed specifically to provide optimum fuel efficiency on intermediate routes.

Looking toward the future, Boeing is also a 21st-century world leader in high-speed unmanned experimental aircraft. These include the X-51 Waverider, which achieved a long-duration flight at Mach 5 in 2010, and the X-43A, which set a speed record of Mach 9.8 in 2004.

With the final flight of the Space Shuttle in 2011, Boeing is among the aerospace companies developing and testing reusable spacecraft for potential future operational missions. One example is the unmanned Boeing X-37 Orbital Test Vehicle, which spent nearly 8 months in orbit in 2010 before returning for a runway landing.

BOMBS, CLUSTER

A cluster bomb is an unpowered and unguided air-dropped or ground-launched explosive weapon that ejects smaller munitions, called submunitions,

designed to kill enemy personnel, destroy vehicles, make runways unusable, or disperse chemical or biological agents or nonlethal items such as leaflets, over a target area. This entry discusses the types of cluster bombs and their submunitions.

General Description

A cluster bomb consists of the bomblets and a dispenser that holds the bomblets while in flight to the target area and then dispenses them over the target area. Some dispensers fall away from the aircraft and are stabilized in flight by fin assemblies. They use either mechanical timers or proximity fuzes that cause the submunitions to disperse at a predetermined height above the target. Multiple-piece dispensers open up and disperse the submunitions when the fuze detonates. Single-piece dispensers eject their submunitions out of ports or holes in the body when the fuze detonates. Attached dispensers stay with the aircraft and disperse their payload out the rear or from the bottom of the dispenser and can be reloaded and reused.

The submunitions include bomblets, grenades, and mines, which are filled with explosives, incendiary material, or chemical or biological agents. They may be antipersonnel, antimateriel, antitank, dual-purpose, incendiary, or chemical submunitions. The dispenser opens up while still in flight and “fires” the submunitions, which generally spread over a large area. Pressure, impact, movement, or disturbance causes the submunitions, depending on their intended use, to detonate. Some types of submunitions have an arming ribbon, parachute, or fin assembly to stabilize them in flight. Some submunitions contain a self-destruct fuze to destroy the submunition after the passage of a preset period of time in case it fails to detonate as intended.

The only cluster bomb with a “smart” capability is the CBU-97, Sensor Fuzed Weapon (SFW), produced by the United States in the 1990s. The SFW consists of a dispenser with 10 submunitions, each with 4 skeet-type warheads. After release, the dispenser disperses the parachute-stabilized submunitions. At a preset altitude, a rocket propels the submunition upward, which begins to spin as it climbs, dispensing the four skeet warheads randomly by centrifugal force. An infrared sensor in each warhead searches for a target and, on discovery, detonates over it, firing a kinetic fragment into

the top of the target. If the skeet does not find a target after a preset time period, a sensor detonates the warhead above ground to spray the battlefield with myriad lethal fragments. This weapon is effective against armor and soft-skinned targets over an area of 4,800 square yards. The United States has only used the SFW in the April 2003 invasion of Iraq.

Origins and Development

The Germans developed the first cluster bombs during World War II. They consisted of a container that held between 6 and 108 submunitions of different types and burst open after release from an aircraft. The most well-known submunition was the 2-kilogram “Splitterbombe SD-2,” or Butterfly Bomb, to attack both civilian and military targets. The Luftwaffe used them in Britain, North Africa, and the Soviet Union.

During the war, the United States, the Soviet Union, and Italy independently developed their own cluster bombs. The U.S. Army Air Forces deployed two cluster bombs, the 100-pound M28 with twenty-four 4-pound M83 submunitions, essentially a copy of the SD-2, and the 500-pound M29 with 90 M83 submunitions. After the war, the United States continued its use during the Korean War and the Vietnam War. The U.S. Army Air Forces also externally wired six 20-pound M41 antipersonnel fragmentation bombs to a pipe to form a “cluster bomb” for ground attacks.

From the 1970s to the 1990s, 34 countries developed cluster bombs in a wide variety of types that are dropped from aircraft or fired by artillery. Since their development, they have been used in at least 23 countries. Azerbaijan used hundreds in Nagorno Karabakh in 1992–1994, and much of the city of Stepanakert remains off limits because of unexploded cluster bombs. Russia used cluster bombs during various phases of the Chechen War and possibly in the 2008 fighting with Georgia in Ossetia, and both Serbian and North Atlantic Treaty Organization forces used cluster bombs during the fighting in the former Yugoslavia between 1994 and 1999.

The United States utilized cluster bombs in the 1991 Persian Gulf War, Operation Enduring Freedom in Afghanistan, and Operation Iraqi Freedom in Iraq. The nongovernmental organization Human Rights Watch claimed that the United States and Britain dropped at least 2 million bomblets in the

April 2003 invasion of Iraq. Israel used American-made cluster bombs extensively in Lebanon in 1978, 1982–2000, and 2006. The United Nations and human rights groups have claimed that Israel dropped as many as 4 million bomblets in Lebanon during the 2006 conflict. Hezbollah fired Chinese-made cluster bombs into northern Israel in 2006. Some reporters have reported that Libyan forces used cluster bombs in the early 2011 conflict against rebel forces trying to overthrow the government of Muammar Qaddafi.

Current Concerns on Use

At least 76 countries currently maintain stockpiles of cluster munitions, including those that produced them. Because cluster bombs release many small bomblets over a wide area, they pose a serious risk to civilians during and after attacks as they cannot discriminate between military and nonmilitary targets, especially in populated areas. Unexploded bomblets can kill or maim civilians long after the end of a conflict and are costly to locate and deactivate or remove. Children are especially at risk as they often mistake the often brightly colored bomblet for a toy or other harmless object.

As a result, the Cluster Munition Coalition, the International Committee of the Red Cross, the United Nations, other organizations, and many nations sponsored the Convention on Cluster Munitions, adopted in Dublin, Ireland, in May 2008. It became effective on August 1, 2010, with the ratification by 30 countries. The convention bans the stockpiling, use, and transfer of virtually all existing types of cluster bombs and provides for the clearing up of unexploded munitions. As of March 2011, 108 states have signed the convention, and 57 of those have ratified it. However, many of the world’s major military powers, including the United States, Russia, Israel, India, Pakistan, and China, did not participate in the convention’s negotiations and have not yet signed it.

BOMBS, GRAVITY

A gravity bomb is an unpowered, unguided air-to-surface weapon that follows a simple ballistic trajectory determined by gravity, release altitude, speed and attitude of the aircraft, speed and direction of the wind, drag (friction of bomb against air), and other physical factors, from release to impact. Gravity bombs are also known as “dumb,” free-fall, iron, or unguided bombs. This entry traces the development and use of gravity bombs and discusses various types of gravity bombs from their first use in World War I to the present.

General Description

A typical gravity bomb has a metal casing with a filler, a fin assembly for flight stability, and a fuze to detonate the bomb. The filler can be conventional explosives, nuclear material, incendiary material, propaganda leaflets, or other inert material. Fuzes include a contact fuze that causes detonation on impact, a pressure fuze that uses an altimeter to detonate the bomb at a preset altitude, a time-delay fuze that detonates the bomb after the passage of a preset time period, and a proximity fuze that detonates the bomb when the distance to target becomes smaller than a predetermined value.

Origins and Use in World War I

The Austrians delivered the first aerial bombs from unmanned balloons during the 1849 siege of Venice. On November 1, 1911, Italian pilot Giulio Gavotti threw grenades into an Ottoman army camp in Libya in the first release of an explosive weapon from a powered aircraft. The following year, a Bulgarian pilot dropped bombs on an Ottoman military base during the Balkan Wars. By August 1914, the French, Germans, Russians, and Austro-Hungarians had developed aircraft specifically for aerial bombardment.

Soon after World War I started in August 1914, German zeppelins bombed Liege, Belgium, in the first air raid in history. During the war, tactical aircraft of all belligerents dropped smoke, incendiary, antipersonnel, and explosive bombs on troop concentrations, supply depots, and transportation junctions on or near the battlefield. The first bombs were originally modified grenades and artillery shells with fins attached for stability. By 1918, all countries had bombs, ranging in size from about 2 pounds to 2,205 pounds, with improved effectiveness, specifically designed for aerial bombardment.

Britain, Italy, Russia, and Germany conducted long-range (strategic) bombing with large, multie-engine aircraft that dropped the larger high-explosive bombs on rail yards, industrial plants, and urban areas beyond the battlefields. However, these aircraft achieved few significant results because of anti-aircraft defenses, lack of an adequate bombsight, and the bombers' limited range and bomb-carrying capacity.

Interwar Period and World War II

Between the two World Wars, air forces developed bombs with more streamlined casings, better fuzes, and more powerful explosives. By 1939, most air forces had developed their own series of standard bombs with variations in shape and type of casing, fuzes, and filling to attack various types of surface targets and for special uses. For example, bombs for use against warships had hardened and shaped casings and time-delayed fuzes that allowed the bomb to pierce a ship's armor plating and then explode below the main deck to maximize damage.

During World War II, the belligerents used aerial bombs, ranging in size from 4 to 22,000 pounds. Fighter-bombers and light bombers dropped the smaller bombs on “soft” targets, such as troop formations, vehicles, field fortifications, railroad yards, and freighters and small warships. Medium and heavy (strategic) bombers dropped 500- to 4,000-pound bombs on large urban areas, industrial complexes, and various concrete structures. Aircraft used 500- to 1,600-pound armor-piercing bombs against large warships and concrete and steel bridges. The very large 10,000- to 22,000-pound bombs were used on hardened targets, such as German submarine pens.

During the war, accurate bombing from high altitudes was still a problem. The U.S. Army Air Forces

used the highly secret Norden bombsight, essentially an analog computer that calculated a release point from the various factors affecting gravity bombs. The Royal Air Force used the Mark XIV bombsight and the Stabilizing Automatic Bomb Sight. Unfortunately, the average circular error probable during the strategic bombing of Germany and Japan was about 1,500 feet with a significant percentage of bombs falling well beyond that radius. To improve accuracy, the United States and Germany made limited progress in developing radio-controlled bombs.

Early Development of Nuclear Bombs

Between 1939 and June 1945, the Manhattan Project developed three atomic (fission) bombs. The project group exploded a test weapon on July 16, 1945, near Alamogordo, New Mexico. American B-29 bombers dropped the second weapon on Hiroshima, Japan, on August 6, 1945, and the third one was dropped, 3 days later, on Nagasaki, Japan.

After World War II ended, a nuclear arms race between the United States and the Soviet Union developed. In 1949, the Soviet Union exploded its first fission bomb. In 1953, the United States tested a thermonuclear (fusion or hydrogen) bomb, and the Soviet Union exploded its first thermonuclear bomb the following year. Initially, both superpowers used high-altitude jet bombers to deliver their nuclear

bombs. By 1959, both countries had intercontinental ballistic missiles that carried a nuclear warhead into low space where it separated from the missile and followed a ballistic trajectory to its target.

Post-1945 to the Present

Since 1945, air forces have used conventional bombs similar to their World War II predecessors. During the Korean and Vietnam Wars, the United States used designs like the M117 and M118. The United States began using the current Mark 80 series general purpose bombs, developed in the 1950s, during the Vietnam War (Table 1).

Like other countries, the United States modified its general purpose bombs for special purposes. For example, during the Vietnam War, the United States added metal or fabric-covered paddles (ballutes) to the rear of the Mark 82 500-pound bomb to produce the “Snake Eye” high-drag bomb. The paddles slowed the bomb’s descent after release, allowing the pilot to conduct high-speed, low-altitude attacks and escape the bomb’s fragmentation pattern without having to climb or perform other dangerous evasive maneuvers.

Since the late 1960s, the United States has used gravity bombs as warheads for its precision-guided munitions (PGMs), or “smart bombs,” to provide substantially greater accuracy than a gravity bomb

Table 1 Modern U.S. General Purpose Bombs: The Mark 80 Series

	<i>Nominal Weight</i>	<i>Practice (Nonexplosive) Designation</i>	<i>Laser-Guided Warhead</i>	<i>INS/GPS Guided Warhead (Joint Direct-Attack Munition)</i>	<i>Retarded Versions</i>
Mk 81	250 lb/113 kg				
Mk 82	500 lb/227 kg	BDU-50	GBU-12D Paveway II	GBU-38	Mk 82 Snake Eye with folded retarded petals; Mk 82 retarded with a ballute
Mk 83	1,000 lb/454 kg		GBU-16B Paveway II	GBU-32	Mk 83 retarded with a ballute
Mk 84	2,000 lb/908 kg	BDU-56	GBU-24B Paveway III	GBU-31	Mk 83 retarded with a ballute

and limit collateral damage to ground forces and civilian populations. The growing use of precision-guided munitions, which became known as smart bombs, since the 1991 Persian Gulf War produced the term *dumb bomb* for gravity bombs. This growing use of precision-guided munitions in combat operations in Iraq and Afghanistan has also meant a corresponding decrease in the percentage of gravity bombs of the total air-delivered weapons used.

BOMBS, NUCLEAR

The first nuclear weapons were gravity bombs dropped from heavy bomber aircraft. Aerial bombs have continued to have a role in nuclear arsenals even after ballistic missiles were developed and assumed a more primary role in worldwide arsenals. Nuclear bombs are here differentiated from other nuclear weapons in that they are delivered by means of gravity bombs from aircraft, as opposed to missiles or artillery. Over the course of the Cold War, a wide variety of nuclear bombs were produced by all sides, in tandem with rapid developments in the bombers that would carry them. Variations in bomb design allowed for weapons of radically different explosive yields, sizes, and shapes, allowing for diverse strategic and tactical applications. This entry

examines U.S. and Soviet Cold War-era nuclear bombs and bombers and modern weapons systems.

U.S. Cold War-Era Nuclear Bombs and Bombers

The initial fission bombs developed by the United States during World War II were exceptionally unwieldy one-off devices. Owing to their rapid development process and their pathbreaking nature, their designs were fairly primitive by even immediate postwar standards, and the final configurations of their nuclear components were not fully determined until only weeks before their actual combat use. The “Little Boy” design bomb used on Hiroshima, Japan, on August 6, 1945, combined two subcritical amounts of highly enriched uranium in a “gun-type” arrangement that fired one mass of uranium into the other through a gun barrel. The “Fat Man” “implosion” design bomb dropped on Nagasaki 3 days later used an elaborate array of fast and slow chemical explosives to symmetrically compress (“implode”) a solid sphere of plutonium to high density, setting off a chain reaction. Both weapons were extremely large and heavy even by World War II standards and required the use of specially modified B-29 bombers to accommodate their large sizes. For maximum destructive power, both weapons were detonated around 550 meters above their targets, through the use of barometric switches and directional antennae. The Little Boy weapon had a yield equivalent to around 15 thousand tons (kilotons) of TNT (trinitrotoluene), and the Fat Man had a yield of 18 to 20 kilotons. Both weapons had their fissile cores inserted prior to takeoff, making them fairly dangerous by modern standards. The Little Boy weapon in particular, because it contained a full critical mass of uranium, separated only by empty space, would run the risk of turning into a small nuclear reactor if it had become submerged in water.

In the years immediately after World War II, the American military services struggled to incorporate the atomic bomb into their battle plans. The Strategic Air Command was created in March 1946 for the purpose of conducting long-range airborne bombing operations. But for the first years of the bomb's existence, American forces had little ability to use the bomb effectively. Until 1950, jurisdiction for assembling and using the bombs was spread out among multiple bureaucratic agencies, the number

of bombers and crews that could use atomic bombs was small, and all nuclear weapons were kept in civilian hands. Military access to even nonnuclear assemblies of atomic weapons would be limited until the Korean War, and access to the corresponding nuclear components (the pits) would be limited until 1951. Military planners were themselves generally unaware of the availability of weapons and assumed that the number of bombs would be low and their availability would be limited.

During this period, American weapons scientists sought to make the bombs safer, less idiosyncratic, and more conservative with regard to the use of fissile material. In the spring of 1948, new bomb designs tested as part of Operation Sandstone, at the Bikini Atoll, dramatically changed America's atomic capabilities. These new developments allowed for greater yield from existing fissionable material (double the explosive power of the bombs used during World War II) and, therefore, the use of substantially less fissionable material (increasing the total stockpile size). They also allowed the development of mass-produced bombs that required less substantial technical expertise to use or assemble than the World War II models. Specifically, at Sandstone, "composite" cores using both uranium and plutonium were developed for the first time, saving valuable plutonium (enriched uranium was more abundant at the time), and the concept of "levitation" was successfully tested. Levitation was an engineering idea that had been developed during the time of the Manhattan Project, the World War II atomic bomb project, and involved putting an air gap between the fissile core and the compressing tamper. The result was that the tamper would have time to accelerate before contacting the core, improving the compression. In addition, a new bomb assembly was tested that could allow for the pit to be inserted in flight, an important safety improvement.

Improvements in efficiency allow for either an increase in yield or a decrease in size. The latter development in particular allowed for the possibility of the use of nuclear bombs by a more varied set of bombers. The development of thermonuclear weapons in the early 1950s produced bomb designs of unprecedented size, weight, and yield, while at the same time the increased miniaturization of weapons design allowed for bombs to be carried by fighter aircraft in a variety of different combat scenarios. Additionally, over the course of the 1950s, a large

number of nuclear weapons would be transferred to military control and deployed both inside and outside of the continental United States. If at the beginning of the 1950s the military had access to only a handful of nuclear bombs, by the beginning of the 1960s, some 90% of the stockpile was physically within military custody.

Technically, the bomb designs developed by the United States during the Cold War were extremely varied. They ranged from immensely heavy strategic bombs like the Mk-41 bomb, which weighed some 4,800 kilograms and had a predicted yield of 25 million tons (megatons) of TNT, to smaller, tactical weapons like the Mk-57, which weighed around 225 kilograms and had an adjustable yield from 5 to 20 kilotons. Many American warhead designs were created to be paired with specific delivery systems: The W-7 warhead, for example, was used for air-to-surface missiles, surface-to-surface missiles, surface-to-air missiles, and the Betty Mk-90 antisubmarine depth bomb. Individual bomb designs could have many variants, including modified aerodynamic properties and modified yields, for use in a variety of tactical or strategic situations.

American bomber strategy was initially hampered by lack of bombers and lack of bombs. By 1952, however, the Strategic Air Command was capable of providing nuclear strikes at a moment's notice (though the number of actual bombs in its physical possession was very limited). This was accomplished both by the development of new, long-range, and refuelable strategic bombers—the B-36, the B-47, and finally the B-52—and by the aforementioned increase in stockpile size. Bombers remained the backbone of U.S. deterrent until the 1960s. Emphasis on the development of long-range missiles capable of delivering nuclear weapons did not begin in full until after the Soviet launch of the satellite *Sputnik* in 1957. The shift toward missiles was in part due to a perceived need for parity with the USSR and partly a means to address the possibility of antibomber defenses and the threat that bombers might be destroyed before takeoff. The development of a continuous airborne alert strategy in 1959, under which a number of bombers would be deployed in the air at all times, supported by refueling planes, and ready to attack whenever the order was given, further guarded against the concern that bombers might be destroyed on the ground.

U.S. bomber deployment peaked in 1958 with more than 1,600 planes. The decline in strategic bombers was directly related to the deployment of intercontinental ballistic missiles (ICBMs) and submarine-launched ballistic missiles (SLBMs), which were deployed by the hundreds beginning in the early and mid-1960s. The USSR, by contrast, deployed around 160 strategic bombers annually throughout the entire Cold War period, only beginning to deploy intercontinental ballistic missiles in great numbers in the mid-1960s, reaching a peak of 1,500 by the early 1970s.

From 1945 through 1998, the United States developed 12 different models of nuclear-capable bombers, and a total of 4,680 individual planes were purchased. In the United States, advanced bomb technology has been extraordinarily expensive. The B-2A Spirit cost nearly \$2.6 billion per plane, whereas the B-1B Lancer cost around \$300 million per plane. By comparison, the Minuteman III had an average unit cost of only \$37 million, and the LGM-118 Peacekeeper missile average cost is \$189 million. It is worth noting, however, that bombers can and have been used in conventional (nonnuclear) operations as well.

Soviet Cold War–Era Nuclear Bombs and Bombers

The USSR detonated its first implosion weapon in August 1949 (a virtual copy, or re-creation, of the Fat Man design) and began serial production of weapons based on the RDS-1 design immediately afterward, though they were limited to a small stockpile through the early 1950s. Further Soviet testing in 1951 and 1953 facilitated the production of more advanced designs—the RDS-2, an improved implosion bomb, and the RDS-6, a submegaton range thermonuclear device, in particular. In 1955, the USSR detonated its first two-stage thermonuclear design (RDS-37). In many respects, warhead development in the USSR appears to have followed a progression similar to that of the United States—not a surprising factor given the roughly symmetrical aspects of the nuclear arms race between the two superpowers.

Despite similarities in warhead designs, though, bomber aircraft development in the former USSR followed a different path, owing to technological, geographical, and bureaucratic factors. Unlike the

United States, which had use of bases in Europe and Asia and had developed long-range strategic bombing as part of its campaigns in World War II, the former USSR had no forward bases that would allow it to strike the mainland United States easily with World War II–era bomber technology. During World War II, Soviet air forces had been subordinate to Soviet ground forces as a rule and existed primarily to repel enemy air attacks; the former USSR did not develop strategic bombing to any considerable degree during the war years.

In the postwar period, the Soviet military put intense emphasis on developing intercontinental platforms for the delivery of strategic weapons to North America. After their first nuclear test in 1949, Soviet design bureaus were charged with developing bombers with a range of 12,000 kilometers and worked to use aerial refueling to extend the range of existing bombers. By 1956, the 3M (Bison) and Tu-95 (Bear) bombers had entered service, the former with a range of 11,850 kilometers and a payload of 5,000 kilograms, the latter with a range of 13,200 kilometers and a payload of 9,000 kilograms. In practice, the bombers had considerably shorter ranges with full payloads (Figure 1).

By 1957, however, developments in Soviet rocketry had convinced Soviet leadership that intercontinental ballistic missiles and submarine-launched ballistic missiles were more promising means for the Soviet Union to project a strategic force. In 1959, the Strategic Rocket Forces was made a separate division of the Soviet armed forces. Missiles became the primary focus of the Soviet long-range strategic forces and brought work on new intercontinental bombers to a near halt. Existing bombers were modified and augmented for use as platforms for air-launched cruise missiles. Bomber development began again in the 1970s, producing a number of new, modern bombers by the mid- to late 1980s, culminating in the deployment of the Tu-160 (Blackjack).

The breakup of the Soviet Union in 1991 left a number of bombers in post-Soviet republics. Kazakhstan agreed to move its former Soviet bombers to Russia; Ukraine, however, claimed 44 planes as its own. Further negotiations, however, resulted in the transfer of about a quarter of that number to Russia in 1999.

Figure 1 U.S. and Soviet Strategic (Nuclear) Bomber and Missile Delivery Vehicles, 1945–1996.

Note: This graph does not indicate the number of warheads per delivery vehicle, which increased dramatically in the period from 1970 onward.

Modern Weapons Systems

As of this writing, the U.S. nuclear arsenal contains only two air-dropped nuclear bombs, the B-61 and the B-83. The B-61 is a family of bomb designs that allows for both tactical and strategic use. According to estimates by the Natural Resources Defense Council, the warheads have variable yield from the subkiloton range up to, in some modifications, around 340 kilotons. The B-61 is deployable on many different U.S. military aircraft, including long-range strategic bombers such as the B-1B Lancer, the B-2A Spirit, and the B-52. The B-61 Mod 11 is mentioned as a probable candidate for a “bunker-busting” nuclear bomb, meant to allow for the destruction of underground facilities. The B-83 is a

strategic bomb with a maximum yield of 1.2 megatons. Around 300 nuclear bombs are currently deployed by the United States as part of its strategic arsenal, and it is believed that some 200 bombs are deployed for tactical use.

Russia stopped producing new bombers at the end of the Cold War. As of this writing, the Natural Resources Defense Council has estimated that Russia has deployed around 80 strategic bombers and some 680 nonstrategic aerial platforms, and these have the capability of deploying some 844 strategic and 800 tactical weapons (these numbers lump bombs in with cruise missiles and air-to-surface missiles).

Both the United Kingdom and France initially deployed strategic aircraft for their nuclear forces,

A disassembled B-61 bomb, displaying some of its almost 6,000 parts. The nuclear warhead is the bullet-shaped cylinder in the middle-left of the photograph.

Source: Photo by Time Life Pictures/Department of Energy (DOE)/Time Life Pictures/Getty Images.

a feat made easier by their comparative proximity to the Soviet Union. The United Kingdom has since converted into an entirely missile-based arsenal, launching from submarine platforms. France has the majority of its forces in submarine-based missiles, as well as in cruise missiles deployed on Mirage aircraft, some of which may be kept on aircraft carriers. China's primary strategic bombing capability lies in its Hong-6 bombers, an antiquated strike force based on the Soviet Tu-16 (Badger). The majority of Chinese nuclear weapons are apparently ballistic missiles. The Natural Resources Defense Council estimates that only around 20 of China's warheads are deployed as bombs. The capabilities of Israel, Pakistan, and India are unknown, but these states are believed to have the technical means to use bombers to cover the distances to their potential enemies. The nuclear capabilities of North Korea remain mysterious.

The clear advantage of bomb delivery from aerial platforms for an aspiring or new nuclear power is that existing, conventional bombing systems can be made to deliver nuclear weapons short-to-moderate distances without imposing radically new technical requirements. Conventional missile systems, in contrast, require much more work to support the high weights of early generation nuclear weapons. The disadvantage of using bombs and bombers is the problem of range—most countries lack long-range strategic bombing capability, and it is not a trivial technology to develop—and the fact that bombers are more vulnerable to detection and interception than missiles. Bombers are also thought to be more vulnerable to a debilitating first-strike attack than missiles based on continuously mobile or hardened platforms.

BOMBS, SMART

Smart bombs are one example of precision-guided munitions (PGMs). They have traditional explosive components, but attached guidance systems—electro-optical, infrared, radio, laser, Global Positioning System (GPS), video—and movable aerodynamic devices, allowing the weapon to “fly” to its target. Smart bombs have been an increasingly heavily utilized form of air-dropped munition since their introduction in World War II. In recent conflicts, smart bombs have comprised more than two thirds of all air-dropped munitions. This entry discusses the history of smart bombs and the current technology.

History

A number of considerations promoted the development of smart bombs, including the desire to increase bombing accuracy and reduce risk to bomber crews. Additional considerations included the desire to reduce civilian casualties and collateral damage. The development of smart bombs evolved from research undertaken during World War I and World War II. Those projects included the work of Charles F. Kettering on the aerial torpedo and German researchers who developed the Fritz X and Hs 293. During World War II, researchers working for the U.S. Army developed the Azon-guided (azimuth only) and Razon-guided bombs.

The Azon bomb was the first radio-controlled bomb used operationally by the U.S. Army Air Corps. The Azon bomb, used until November 1944, attached a radio-command link-control tail kit to a standard bomb body. At the end of World War II, and again in the Korean War, the Army Air Corps deployed the Razon bomb that featured two control assemblies, based on a 1,000- or 2,000-pound standard bomb.

The development of atomic bombs at the close of World War II caused many to believe that conventional war was outdated. As a result, interest in PGMs all but vanished. However, during the 1950s and 1960s, it became apparent that nation-states were reluctant to use atomic weapons and continued to fight conventional wars using conventional weapons. As a result, research in PGMs found new life.

During the Vietnam War, research into smart bombs gained momentum. Ground commanders demanded a weapon that would allow them to destroy critical targets in or near population centers while causing little or no civilian casualties or collateral damage.

In part to meet that need, researchers at the U.S. Army Missile Command, Redstone Arsenal, Alabama, began experimenting with a laser guidance system for conventional bombs in 1962. All laser-guided bombs (LGBs) work in much the same way. The attacker illuminates the target with a laser, referred to as painting the target. The guidance package attached to the bomb allows it to fly to the target along the laser beam, thus increasing bombing accuracy. LGBs, however, have limitations. Cloud cover, fog, dust, or smoke disrupts the beam used to designate the target, restricting their use in all but fair weather.

The U.S. Air Force initially showed little interest in LGB research but adopted the project as its own by the late 1960s. Pilots assigned to the 8th Tactical Fighter Wing, Ubon, Thailand, dropped the first LGB during the Vietnam War, in May 1968. The weapon, a Bolt-117, was a 750-pound M117 equipped with a KMU-342B guidance kit.

The U.S. Navy smart bomb development program began in 1963 and relied on television guidance rather than laser guidance. Similar to television-guided weapons developed during World War II, the AGM-62 Walleye I, developed by the U.S. Navy, locked a television camera carried aboard the aircraft onto the ground target prior to weapons release. The pilot then watched the bombs trajectory on his television screen making adjustments as necessary. The first successful combat test occurred in 1967.

It was not until May 1972 that LGBs and television-guided bombs proved their practical value when their use contributed to the partial destruction of the Thanh Hoa Bridge in North Vietnam. While smart bombs were successfully tested and deployed during the Vietnam War, LGBs represented only 1% of the bombs dropped. Precision-guided bombs were not the primary weapons in the U.S. arsenal by the end of the Vietnam War, and they did not come into common use until the development of microchip technology.

Contemporary Smart Bombs

Following the Vietnam War, research and use of smart bombs continued. During the Yom Kippur

War in 1973, the Israeli Air Force successfully used Walleye Is against Egyptian targets. During the 1986 U.S. Operation El Dorado Canyon air attack on Libya, F-117 aircraft used LGBs to destroy targets located in or near civilian sites.

Smart bomb technology came of age during Operation Desert Storm. In the 1991 UN-authorized military action against Iraq, the coalition forces dropped approximately 88,500 tons of bombs. Smart bombs proved very effective during the campaign. Much of the gun camera video seen by television viewers around the world showed the destruction of Iraqi targets by smart bombs. However, smart bombs represented only approximately 8.5% of the total tonnage dropped.

Improvements in smart bomb technology continued after Operation Desert Storm with the addition of satellite-guided weapons such as the Joint Direct Attack Munition and the Joint Standoff Weapon. These weapons used the U.S. GPS for guidance, giving the weapons an all-weather capability.

Precision weapons also proved invaluable during the 1995 bombing campaign in Bosnia and the 1999 Operation Allied Force when almost all U.S. airstrikes involved the use of smart bombs during the North Atlantic Treaty Organization-led conflict in Kosovo.

By the turn of the 21st century, smart bomb technology had proven itself. During Operation Enduring Freedom, the 2001 U.S. war in Afghanistan, and Operation Iraqi Freedom, the 2003 multinational force invasions of Iraq led by the United States and Great Britain, the American public and the world court of opinion increasingly demanded that coalition forces increase the use of smart bombs against targets, especially in urban areas, in an effort to reduce civilian casualties and collateral damage. Approximately 70% of the bombs dropped by coalition forces during combat operations against Iraqi military forces during the 2003 air campaign were smart bombs.

Smart bomb technology allows commanders on the 21st-century battlefield to target enemy forces more effectively and efficiently. During World War I and World War II, it often took literally hundreds of aircraft flying dozens of sorties to destroy a single target. During Operation Enduring Freedom airstrikes over Afghanistan, each aircraft destroyed 4.07 targets per flight. The development of precision-guided weapons and smart bombs provided battlefield

commanders and political leaders the capability to destroy enemy targets without destroying nearby or collocated civilian population centers, thus bringing to fruition the concept of strategic bombing first envisioned by Air Corps Tactical School strategists in the 1930s.

BORDER PATROL

The U.S. Border Patrol is a federal law enforcement agency in U.S. Customs and Border Protection, which operates under the Department of Homeland Security. Formerly a part of the Immigration and Naturalization Service (INS), which itself was part of the Department of Justice until Immigration and Naturalization Service was decommissioned in 2003, the Border Patrol is one of the three immigration enforcement agencies in the Department of Homeland Security (the other two being Immigration and Customs Enforcement and the U.S. Coast Guard, an armed service responsible for patrolling maritime borders). The acting commissioner of the U.S. Border Patrol is currently David V. Aguilar, and the current chief is Michael J. Fisher. This entry discusses the history of the Border Patrol and current issues.

History and Background

In the early republic, securing the border remained an important mission for the U.S. Army. During the War of 1812, U.S. military and naval forces would fail on several occasions to prevent invasions through

Canada and attacks on the high seas. The Rush-Bagot Agreement of 1817 between Great Britain and the United States demilitarized the Great Lakes, and this policy was extended in the 19th century to encompass the entire length of the Canadian-U.S. border.

In 1846, a border clash between the U.S. Army and Mexican forces in a territory claimed by both countries led President James K. Polk to seek a declaration of war against Mexico. The Mexican-American War led to the annexation of what is now Arizona, New Mexico, and California, greatly expanding the boundary between Mexico and the United States. Beginning in the late 1840s and continuing into the 20th century, U.S. Army units were regularly positioned at the Mexican border, along with state or local law enforcement agencies (e.g., the Texas Rangers). The 1848 Treaty of Guadalupe Hidalgo went so far as to initially include a provision by which the U.S. Army would protect the Mexican border from Indian attacks, but the provision was removed when the impossibility of enforcing it was realized. In the 20th century, a raid by forces of Francisco “Pancho” Villa on Columbus, New Mexico, in 1916 led President Woodrow Wilson to send an army expeditionary force into Mexico under the command of General John J. Pershing. Despite an excursion that took American forces deep into Mexico, Villa managed to escape.

Controlling the U.S. borders to keep out illegal immigrants is a relatively recent phenomenon, as for much of its history the United States had few restrictions on individuals entering the United States. The one significant exception was a ban on the importation of slaves from Africa. During the antebellum era, the U.S. Navy enforced the ban on slave importation. Not until the passage of the Chinese Exclusion Act of 1882 did the federal government actively patrol the Mexican and Canadian border with a small force of U.S. Immigration inspectors to exclude illegal crossing by Chinese and later other Asian immigrants. In 1921 and 1924, the United States implemented restrictions on immigration and established a quota system. This resulted in the creation of the modern border patrol in May 1924, under the U.S. Labor Appropriation Act. Besides seeking to control the border to prevent illegal immigrants from entering, the Border Patrol seized significant quantities of illegal alcohol imported into the United States in violation of the Volstead Act. Often, when the Border

Patrol intercepted smuggled liquor, illegal immigrants were found with the cargo, resulting in one of the first instances of widespread federal intervention in illegal immigration through the borders.

In 1952, the jurisdiction of the Border Patrol was expanded to encompass search and apprehension of illegal immigrants anywhere in the United States. In 1952, 52,000 illegal immigrants were airlifted back to Mexico, and another 50,000 were boat lifted from Texas to Vera Cruz in 1954. Although the federal government sought to restrict the flow of illegal immigrants into the United States by either halting them at the border or deporting them, undocumented workers, especially from Mexico, remained essential to agribusiness, especially in the Southwest. Moreover, penalties were seldom enforced or nonexistent. The Immigration and Reform Control Act of 1986 not only expanded funding for border enforcement but also required employers to verify the citizenship and immigration status of employees. Despite the stiffening of penalties for employing undocumented workers, a number of sectors of the economy, especially agriculture, construction, and food service, continue to depend on their labor. Throughout the 1980s and 1990s, the issue of illegal immigration into the United States, particularly through the Mexican border, moved to the forefront of national attention, with several new initiatives attempting to eliminate illegal immigration. The “Hold the Line” show-of-force strategy around El Paso, Texas, in 1993, with a follow-up operation known as “Operation Gatekeeper” around San Diego in 1994, focused on preventing illegal entry and cut back on immigration by as much as 75% in San Diego alone. A national expansion of this strategy was undertaken shortly afterward, and while illegal entries were better managed, the Border Patrol was able to focus more narrowly on antismuggling efforts throughout the 1990s.

After the September 11 attacks in 2001, national border security became one of the biggest issues of concern for the federal government. In 2003, President George W. Bush decommissioned the Immigration and Naturalization Service and delegated the responsibility of immigration enforcement to the new Department of Homeland Security that was created on March 1 of that year. The Department of Homeland Security would contain two specific immigration departments—Customs and Border Protection and Immigration and Customs Enforcement. This shift in responsibility

indicated that the primary concern of the U.S. government had moved away from illegal immigration as such and instead focused on border security as it related to the Global War on Terrorism.

Current Issues

The Posse Comitatus Act, passed in the aftermath of the Civil War, has prohibited the use of the U.S. military, except the U.S. Coast Guard, for enforcing civil law. But since the start of the War on Drugs and the expansion of the War on Terrorism, the role of the armed forces in securing the nation's borders has increased. The armed services have steadily increased the technical assistance provided to law enforcement agencies to combat the influx of illegal drugs and illegal immigrants. Escalating violence on the Mexican border has led to state governors and Presidents George W. Bush and Barack Obama to deploy the National Guard to portions of the Southwest.

The Border Patrol has grown exponentially during the past two decades. In Fiscal Year (FY) 1992, it had a force of 4,139 agents that expanded to 10,045 in FY 2002, and in FY 2011, it had more than doubled to 21,444. In FY 1992, the budget for the patrol was \$326,234,000, and by FY 2011, the budget has grown to more than 3.5 billion dollars. In FY 2011, the Border Patrol made more than 340,000 apprehensions of individuals entering the United States illegally, down from more than 1 million in 2006. In FY 2011, it seized more than 2 million pounds of marijuana, 9,000 pounds of cocaine, and 6,000 pounds of heroin, as well as more than 14 million dollars in currency. Despite these efforts, the efficacy of the Border Patrol has become a major political issue, particularly in states that share a border with Mexico. In 2012, the Border Patrol released a new national strategy to be utilized through 2016, featuring two overarching goals and a number of primary objectives. The first goal of the Border Patrol is to “secure America's borders,” with the objectives of preventing terrorism and terrorist weapons from entering the United States, managing risk, and disrupting transnational criminal organizations. The second goal is to “strengthen the Border Patrol,” with the objectives of investing in people, supporting Border Patrol employees, preserving organizational integrity, improving organizational structures and processes, and enhancing the overall efficiency of the Border Patrol.

Calls for securing the borders in the first decade of the 2000s led not only to the expansion of Border Patrol personnel but also to the construction of hundreds of miles of heavily fortified fences. Despite the massive investments, the flow of undocumented aliens continued, albeit in reduced numbers. Many illegal immigrants seeking entry either try to enter through more isolated portions of the borders or pay large sums to human smugglers.

A border that allows no undocumented immigrants to enter is virtually impossible in a free society that seeks the free movement of individuals and goods. Moreover, there is considerable debate whether it is even possible or desirable to try to deport the several million undocumented immigrants currently living in the United States. Questions of border security will likely continue to be a divisive and complicated issue for the foreseeable future.

BOSNIA INTERVENTION

The Bosnian War started in April 1992 and ended with the signing of the General Framework for Peace in Bosnia and Herzegovina, more commonly known as the Dayton Peace Accords, in December 1995. According to data collected by the International

Criminal Tribunal for the former Yugoslavia, the civil war claimed the lives of an estimated 105,000 people, internally displaced more than 1 million individuals, and led more than 1 million people to flee the country. Fueled by ethno-nationalist sentiments, the fighting was vicious, frequently targeting civilians and involving serious human rights abuses. Although war crimes, including the ethnic cleansing of different towns and neighborhoods, were committed by all the factions, the majority of these were perpetrated by Bosnian Serb forces. The war also created a severe humanitarian crisis.

Historical Background

Bosnia was the former Yugoslavia's most diverse republic. According to a census conducted in March 1991, 44% of the population described itself as Muslim, 31% as Serbs, 17% as Croats, and 6% as Yugoslavs. In October 1991, after Slovenia and Croatia declared their independence, Bosnia's parliament, which broadly reflected the territory's ethnic makeup, met to consider whether the republic would remain part of a Serb-controlled Yugoslavia. As these discussions were taking place, Bosnian Serb leaders, fearing their minority status, established the Republika Srpska (RS) or the Serb Republic. Shortly thereafter, a group of Bosnian Croat politicians created the Croatian Republic of Herzeg-Bosnia.

At the end of January 1992, the Bosnian parliament passed a resolution to hold a referendum to determine the territory's status. This vote was held on February 29 and March 1. Although most Bosnian Serbs boycotted the referendum, 99% of people who participated supported the republic's independence, and the government declared the country's independence on March 3. Fearing the outbreak of a civil war, European negotiators met with leaders of Bosnia's main ethnic factions to negotiate a new federal constitution for Bosnia. The talks failed to ease the tensions. Deep disagreements over the size of each canton and the powers of the envisioned federal government heightened feelings of mistrust. Although small battles between these factions had taken place after the government's declaration of independence, the civil war formally started once the United States and the European Community (today's European Union, or EU) recognized Bosnia's sovereignty.

During the first 6 months of the war, most of the fighting took place between the Bosnian government's forces, the Army of the Republic of Bosnia and Herzegovina (ARBiH), the Army of the Republika Srpska, and multiple Serb militias. In the first months of the struggle, Bosnian Serb forces captured 70% of the country's territory. In an effort to balance Serb aggression, the Bosnian president Alija Izetbegovic and the Croatian president Franjo Tudjman signed a military alliance, allowing the Bosnian-based Croat Defense Council and the Croatian Army to work together against Serb forces in Bosnia and in Croatia. By January 1993, this alliance faltered and the civil war grew more complex as the Croat Defense Council started operations against the ARBiH in central and eastern Bosnia.

Militarily, the ARBiH faced three disadvantages. First, the UN Security Council's arms embargo against the former Yugoslavia, established by Resolution 713 in September 1991 and extended to all the Yugoslav successor states in January 1992 via the adoption of Resolution 727, hampered the Bosnian government's ability to arm itself and effectively reinforced its enemies' gains.

Second, the ARBiH lacked heavy weaponry. According to some estimates, Bosnian Serb forces possessed 77% of all tanks and 86% of all heavy artillery in Bosnia and Herzegovina. In comparison, Bosnian Muslim troops had 10% of tanks and 3% of heavy artillery, while Bosnian Croat forces controlled 13% of tanks and 11% artillery. Finally, while the arms embargo was in place, this did not stop Croatia and the Serb-controlled Yugoslavia from providing financial and materiel support to Bosnian Croat and Bosnian Serb forces.

The Failed Peace Plans of the International Conference on the Former Yugoslavia

Early during the conflict, the international community's diplomatic efforts were led by the International Conference on the Former Yugoslavia (ICFY), co-headed by the European Community and the United Nations. While the United States and Russia were happy to take a backseat in these proceedings, their interests shaped the international response to the crisis. Russians took a pro-Serb stance, making it clear that their representative would not support any proposal that called on the use of force against Bosnian Serb forces. While the U.S. stance was

pro-Bosnian Muslim, the newly elected Clinton administration wanted to spend more time on domestic concerns. The White House also made it clear that it was reluctant to deploy U.S. troops to enforce a potential peace agreement, though it welcomed other measures, such as the trade embargo placed on Yugoslavia by UN Security Resolution 757 in May 1992, to pressure the Bosnian Serbs and their Yugoslav allies to negotiate an end to the conflict.

The ICFY negotiated two peace agreements, both of which failed. The first was the Vance-Owen Peace Plan (VOPP), negotiated by Lord David Owen, the European Community negotiator, and Cyrus Vance in his capacity as the UN Special Envoy to Bosnia. The second was the HMS *Invincible* Plan, finalized on the British aircraft carrier and negotiated by Owen and Vance's successor, Thorvald Stoltenberg.

The VOPP proposed the cantonization of Bosnia into 10 units, with each faction controlling three cantons and the Sarajevo canton acting as an independent, multiethnic center. Many reasons explain the VOPP's failure, but two are the most important. First, to secure Bosnian Serb leadership's support, Owen and Vance told Slobodan Milosevic, the Serb president, that the United Nations would lift the economic embargo placed against Yugoslavia if a plan was signed. While Radovan Karadzic, the RS president, signed the agreement, Bosnian Serb legislators did not support it. Second, the Clinton administration argued that the plan did not advance Bosnian Muslims' interests but instead rewarded ethnic cleansing.

The HMS *Invincible* Plan was similar to the VOPP, but it proposed Bosnia's internal division into three cantons, each controlled by a separate faction. Many of the plan's details were proposed by Milosevic and Tudjman, demonstrating their interest in ending the fighting. Izetbegovic rejected the plan because it included a provision that would allow the cantons to secede 2 years after the signature of the agreement.

The failure of these plans affected the peace process in three ways. First, angered by Bosnian Serbs' unwillingness to end the fighting and because of the impact the economic sanctions were having on his country, Milosevic signaled that he would be willing to ignore Bosnian Serbs' interests if that supported his political ambitions. Second, European diplomats' influence over the peace process decreased, as many experts and officials questioned the ICFY's authority.

Last, the United States, concerned that the Bosnian war was affecting its relationship with its European allies and believing that a successful peacemaking approach had to promote Bosnian Muslim interests, started to play an active role in diplomatic efforts.

Coercive Diplomacy and the Road to Dayton

The Clinton administration made it clear that peace could not be achieved without changing Bosnia's balance of military power. One of Washington's most controversial proposals was dubbed "lift and strike." The idea was to lift the arms embargo to allow the Bosnian government to arm itself and use North Atlantic Treaty organization (NATO) air strikes to counter any offensive operations aimed against Bosnian Muslim positions. The European allies rejected this proposal for two reasons. First, they argued it would escalate the war and lead to more human suffering. Second, they felt that these actions would compromise the safety of their troops participating in the UN Protection Force (UNPROFOR), a peacekeeping force sent to Bosnia in March 1993 to secure humanitarian corridors and cities designated by the United Nations as safe areas.

Even though U.S. officials failed to sway their European counterparts, NATO policy toward Bosnia did evolve. For instance, in January 1994, NATO agreed to use air strikes in limited circumstances and in coordination with UNPROFOR commanders and the UN secretary general's prior approval. This "dual key" strategy was first tested by Bosnian Serbs' attack of a marketplace in Sarajevo, which claimed the lives of 68 people. The Clinton administration used the incident to convince NATO to issue an ultimatum that required Bosnian Serb forces to end the siege of Sarajevo and to withdraw their heavy weapons to a UN-monitored exclusion zone. While the RS leadership complied with NATO's demands, its air force violated the UN-mandated no-fly zone, forcing NATO warplanes to shoot down these fighter jets.

On March 18, 1994, the Clinton administration negotiated an end to the struggle between the Bosnian Croats and Bosnian Muslims. By signing the Washington Agreement, both factions agreed to establish the Muslim-Croat Federation, a political unit that would join the RS in a united Bosnia. Both sides also agreed to combine efforts to reverse

Bosnian Serb forces' military gains. The establishment of this new alliance allowed Croatia to supply armaments, financing, and other logistical support to the federation.

In April 1994, the United States, Russia, Britain, France, and Germany established the Contact Group, eclipsing the ICFY's mediation efforts. After weeks of deliberation, the Contact Group presented the factions a new peace plan with a new territorial formula. The plan envisioned a country divided in two halves. The RS was asked to surrender around 21% of the territory it controlled, leaving the Muslim-Croat Federation in control of 51% of the country. The federation supported the plan, while the RS did not, leading the international community to tighten economic sanctions against the RS.

The Contact Group was not able to ameliorate divisions among its members. Many unresolved issues complicated the search for peace. For instance, one important area of disagreement was the Clinton administration's unwillingness to send American forces to the region to monitor a peace agreement. Another controversial issue was Washington's insistence on backing diplomatic efforts with coercive measures. Although NATO had used force to enforce the UN Security Council's resolutions, the Clinton administration wanted to change the rules of engagement in order to further support the federation's interests. While these issues had compromised the Contact Group's resolve, diplomats still searched for ways to end the fighting.

On April 30, 1995, a cease-fire negotiated by the former U.S. president Jimmy Carter ended, and fighting between RS and federation forces resumed. The RS leadership approved a bold military campaign to defeat its enemies and bring the war to an end. Testing the international community's resolve, Bosnian Serb forces shelled Sarajevo. While the Clinton administration called for the United Nations and its allies to attack Bosnian Serb positions, the United Nations did not retaliate. This may have emboldened the RS leadership, which ordered its troops to attack several UN Safe Areas. Although the United Nations and NATO agreed to take action, NATO strikes were suspended shortly after Bosnian Serb forces took UN peacekeepers hostage. In the end, the RS freed the hostages, but the incident forced the Contact Group to reconsider UNPROFOR's effectiveness and the overall efficacy of the Contact Group's peacemaking efforts.

After UNPROFOR's humiliation, some European leaders wanted to end the peacekeeping mission. The Clinton administration strongly opposed these views. One problem was that NATO had agreed to assist in UNPROFOR's extraction. Although NATO's Operation Plan 40104 had not been approved by the North Atlantic Council, it required the deployment of as many as 25,000 U.S. forces. While Britain, France, and the Netherlands deployed a Rapid Reaction Force (RRF) to support UNPROFOR's mandate, they also suggested that if this strategy failed, they would end the UNPROFOR mission.

The RRF's deployment did not change the conflict's dynamics or settle divisions among the Contact Group. On July 6, 1995, Bosnian Serb forces, led by General Ratko Mladic, attacked the UN Safe Area of Srebrenica. After the United Nations turned down Dutch peacekeepers' request for air strikes, Mladic's forces took over the town and committed the worst human rights abuses in Europe since the Holocaust, executing an estimated 8,000 males of fighting age. The fall of Srebrenica encouraged Bosnian Serbs to target other UN Safe Areas.

The RS's military offensive forced the Contact Group to meet in London to consider extra steps to address the crisis. After much debate, it was agreed that NATO would play a bigger role in the implementation of the UN Security Council's resolutions. More important, the Contact Group's leadership agreed to terminate the dual-key strategy, giving commanders on the ground the power to ask NATO to strike Bosnian Serb targets. After the London Conference, NATO developed different war plans, while the Clinton administration started to review its own Bosnian policy and consider what Ivo Daalder dubbed the "endgame strategy."

This strategy was built on the Clinton administration's view that peace could not be achieved without changing Bosnia's balance of power. In August 1995, senior U.S. officials traveled to Europe to sell their strategy, which included the following points. First, they argued that coercive tactics could support the Contact Group's efforts to settle the crisis. Second, while the Contact Group plan's principles would be used as a basis for negotiations, the Clinton administration was willing to reconsider Bosnia's internal boundaries and its constitutional structures to secure an end to the conflict. Third, the U.S. officials argued that regional dynamics had fueled the fighting in Bosnia and that the participation of Croatia

and Yugoslavia in the peace process was necessary. But their participation would be contingent on their recognition of each other's sovereignty as well as acceptance of Bosnia as an independent country. In exchange for their participation, the Contact Group would resolve the crisis in Eastern Slavonia, the only part of Croatia controlled by Serb forces at the end of August 1995, while the Contact Group agreed to suspend the economic sanctions placed against Yugoslavia once an agreement had been signed. Fourth, the Contact Group would support postwar peacebuilding efforts, financing Bosnia's reconstruction and deploying a peacekeeping force that would include U.S. troops.

While European leaders and Russian diplomats welcomed this initiative, they also were wary about the use of coercive tactics. The Clinton administration's nomination of Richard Holbrooke, the assistant secretary of state for European affairs and a former U.S. ambassador to Germany, as the new envoy to Bosnia sent a signal that the United States was serious about settling the war. But it was Bosnian Serbs' decision to shell Sarajevo at the end of August that convinced the Contact Group to embrace the Clinton administration's strategy. After several days of NATO bombings and ground attacks from the RRF, the Bosnian Serb parliament agreed to enter U.S.-sponsored peace negotiations. While Western attacks paused, the RS's unwillingness to withdraw its forces from outside Sarajevo led NATO to resume its aerial strikes.

NATO's air campaign had the desired effect on the Bosnian Serb leadership, but it complicated the Contact Group's relations with the federation's leaders. The air strikes had helped the federation win a number of important battles. Holbrooke met with Izetbegovic and warned him that if he did not join a new round of peace talks, the United States would cut all assistance and support UNPROFOR's withdrawal. On October 5, 1995, the RS and federation agreed to a cease-fire and President Clinton invited leaders from the entities of Croatia, Yugoslavia, and Bosnia to join the Contact Group at the Wright-Patterson Air Force Base in Dayton, Ohio, on November 1, 1995, to negotiate an end to the war.

The Dayton Peace Talks and After

Before Clinton's invitation, Holbrooke held a series of meetings that helped secure the success of

the Dayton peace talks. The talks were based on the principles U.S. diplomats had presented to the Contact Group in August 1995. Learning from previous failed negotiations, Holbrooke also suggested that Milosevic, Tudjman, and Izetbegovic should lead the negotiations. In other words, Milosevic would represent Bosnian Serb interests, while Tudjman would represent the needs of the Bosnian Croat community. Technically speaking, Izetbegovic, as the Bosnian president, would represent his country's interests, but in all practicality, he represented Bosnian Muslims' interests. While Bosnian Croats embraced this proposal because they felt that Tudjman would protect their interests, Bosnian Serbs had initially rejected it. But NATO's air campaign and the federation's military victories forced them to accept this proposal.

Holbrooke and the Contact Group's representatives held summits in Geneva and New York before the start of the Dayton peace talks. These gatherings were used to establish the *Basic Agreed Principles*, a document that reflected the Clinton administration's main negotiation principles but that also included a number of confidence-building measures to reassure the participants that the talks would seriously consider their interests. For instance, the document recognized the RS as one of the entities of a united Bosnia, and it allowed the country's entities to set up special relationships with neighboring states. It also stressed that Bosnia's division should be based on the 49–51 principle found in the Contact Group plan of 1994 and that democratic elections would be organized to select the members of the national legislature and of the federal government's executive branch.

The Dayton peace talks lasted 21 days. While many issues complicated the negotiation sessions, Tudjman's and Milosevic's participation secured the acceptance of the plan by the Bosnian Croat and Bosnian Serb leaders. The Clinton administration also pressured Bosnian Muslim leaders to sign the peace agreement. Divisions among the Contact Group's members also complicated the negotiation process. Two issues proved to be extremely contentious with important consequences for the implementation of the peace plan.

First, European representatives wanted the Contact Group to use its resources to secure a new Bosnian constitution with a strong central government. Their argument was that a strong government

could carry out important reforms that would bring Bosnia in line with EU standards. American representatives believed that Bosnia's territorial divisions were going to be the most complicated aspect of the talks. Thus, they preferred to dedicate less time to constitutional issues and more attention to the map. While Holbrooke and his team did secure a compromise on the map in the last day of the talks, the Dayton constitution established what one European representative called the "world's most decentralized state."

Second, the Contact Group could not agree on the mandate and architecture of the postwar mission. While the European and American officials agreed that the United Nations would play a small role in peacebuilding efforts, the Europeans wanted to establish an international civilian body to help Bosnian leaders organize elections, establish the central government and judiciary, and jump-start the economy. This body would be assisted by a NATO peacekeeping force. The Clinton administration, fearing mission creep, wanted a U.S. commander to head the mission. The mission's goal was the separation of forces and the buildup of the federation's forces as a way of deterring the Bosnian Serbs from restarting the fighting. The American negotiators also favored a civilian component to be used to monitor the implementation of the agreement.

In the end, the Contact Group agreed that NATO would deploy a peacekeeping force and that its commander, an American admiral, would work with the Office of the High Representative (OHR)—the civilian body alluded to above—to secure the implementation of the peace agreement. NATO's mission was to provide security and to establish a balance of power between the forces, while the OHR would work with Bosnian leaders and other international bodies to organize elections, to support efforts to relocate refugees and internally displaced families, to jump-start the economy, and to establish the federal government. To secure the EU's willingness to finance most of Bosnia's reconstruction, the Contact Group agreed that a European diplomat would serve as the high representative. While the OHR had to regularly report to the UN Security Council, its work was overseen by an ad hoc international body known as the Peace International Council (PIC), which included the participation of Contact Group countries, donor countries, and international bodies, including the Organization of the Islamic Conference.

Although the Dayton Peace Accords successfully settled the fighting, they have not been able to promote a new national political culture to unify the three major factions. By and large, the same political parties that drove the country to war in the early 1990s are the ones that have dominated Bosnia's post-Dayton political system. Thus, nationalist leaders in each community have obstructed the implementation of the negotiated peace, forcing the OHR, with the EU's support, to administer the country. In 1997, the PIC and NATO's North Atlantic Council reviewed the pace of implementation, concluding that they needed to execute a more robust peace-building strategy.

The PIC gave the OHR the power to dismiss obstructionist politicians and to execute the necessary laws and reforms to advance the provisions of the peace agreement. Since 1998, the OHR, with the EU's assistance, has been trying to correct the faults in Bosnia's constitutional system, strengthening the federal institutions' powers at the expense of the entities' authority. (The Dayton Peace Accords establishes that Bosnia is divided into two territorial entities—the Federation and Republika Sprska. See previous paragraphs detailing pre-Dayton talks in Geneva and New York.)

While NATO ended its peacekeeping mission in December 2004, a smaller EU Force has remained in Bosnia since then. Both civilian administrators and peacekeepers have also pressured Bosnians to arrest war criminals and to extradite them to The Hague to face trial. As of 2012, the former Bosnian Serb leader Radovan Karadzic and the former Bosnian Serb military commander Ratko Mladic were both tried on charges of genocide and other war crimes. Although much has been done to secure Bosnia's long-term stability and to reverse the consequences of the war, many experts believe that interethnic squabbles could quickly descend into violence without the presence of the international community.

BRAZIL

The United States and Brazil have maintained good political and military relations throughout their history. With a population of 201 million (fifth largest in the world), a land mass slightly smaller than the United States, and a gross domestic product per capita of \$8,240, Brazil is becoming a powerful nation. It belongs to the BRICS (Brazil, Russia, India, China, and South Africa) bloc. The United States and China are its two major markets for imports and exports. Recently, Brazil discovered oil reserves off its coast, estimated to be in the top 10 in the world. Brazil's increasingly influential global position has shifted its relations with the United States economically, politically, and militarily. U.S. president Barack Obama's March 2011 visit and an April 2010 military agreement suggest that the two countries are close. Nevertheless, Brazilians have a strong sense of history and long-term planning, which affects U.S.-Brazilian relations. This entry discusses Brazil's armed forces and the history of Brazil's relationship with the United States.

The Brazilian Armed Forces

The Brazilian armed forces (army, navy, and air force) have been under the umbrella of the Ministry of Defense since 1999. Prior to this, they were individual ministries. The president is the commander in chief over roughly 370,000 active military personnel.

The army is the largest and most influential of the three armed forces, with 190,000 military personnel as of 2010; during the military dictatorship, 1964–1985, each president was an army general along with the majority of the Cabinet. The army has a 9- to 12-month conscription, averaging 125,000 people.

There is also a large reserve force, which includes the military police and military firefighters.

There is constant competition between the air force and the navy. The navy is the oldest of the three forces with 59,000 troops. It has its own aviation force with 2,500 people and 15,000 marines. The air force was only established in 1941, but it has become the largest in Latin America with 69,480 members. It also controls the civilian air including traffic control and airport construction and maintenance.

In terms of weaponry, the armed forces have fighter planes, transport planes, surface-to-surface missiles, tanks, and armored vehicles. They have a strong arms industry, which is a leading exporter. In 2008, a National Defense Strategy was created to further build up its industry and international alliances. So there continue to be many purchases, upgrades, and improvements in equipment and training.

Early U.S.-Brazilian Relations

The United States was the first nation to establish a consulate in Brazil (1808) and to recognize Brazil's independence (from Portugal) in 1822. Friendly relations continued into the 20th century with occasional disagreements. In 1902, Brazil closed the Amazon River to international shipping, protesting recent U.S. action in the region. Then, as World War I broke out, the U.S. government rescinded a contract to provide arms for Brazil. Since that time, the Brazilian government has sought to develop its own arms and armed forces.

Good relations continued in the 1930s and throughout World War II. In November 1936, President Franklin D. Roosevelt, in a visit to Brazil, said that President Getulio Vargas of Brazil had helped him conceive the New Deal. During World War II, the U.S. military argued that northeast Brazil was vulnerable to attack, being a short flight from the African continent. The U.S. Navy's Fourth Fleet, based in Recife, patrolled the area. Brazilian officers trained in the United States, and the U.S. military trained Brazilians in schools and the bases in Brazil and provided the Brazilian army with equipment. Brazilian troops fought with the United States in Italy. And as plans for the new United Nations began, Roosevelt intimated that Brazil would be involved. Brazil hoped for a permanent seat on the Security Council. However, after Roosevelt's death, Brazil was excluded.

Post-World War II Relations

After World War II, Brazil aligned with the United States. Brazilian military officers taught at schools run by the U.S. military across South America. Brazil developed the National War School in 1950 with U.S. funding. There was strong U.S. doctrinal influence with an anticommunist attitude. Yet Brazil differed from the United States in its insistence that the real conflict to be resolved was not East versus West but between developed and developing countries. This has remained a guiding principle of Brazil's outlook, often misunderstood by the United States.

In the 1960s, President John F. Kennedy sought an Alliance for Progress to fight the USSR and develop Latin America. With the Cuban Revolution, the U.S. military plan in Latin America was to defeat local guerrilla movements, assuming they were communist. Many Brazilian officers trained in the United States and at the School of the Americas. Brazil's National Security Doctrine emerged from this teaching and that in Brazil's National War School.

However, U.S.-Brazilian relations were conflictual early in this decade. In 1961, Janio Quadros was elected Brazilian president, causing U.S. consternation. He continued to develop relations with Cuba and the USSR. When the United States tried to get Brazil's support for the Bay of Pigs invasion, Quadros refused three times. In 1962, Quadros resigned, and Vice President Joao Goulart rose to the presidency. The Brazilian military and the United States accused Goulart of being a Communist. Goulart repeatedly emphasized that Brazil would remain neutral in the East/West controversy because the real divide was between developed and developing nations. He allowed communists to participate in government. Furthermore, he stated that if Washington did not fulfill the contract to provide helicopters, he would purchase them from Poland.

When the Central Intelligence Agency found out about a coup planned by Brazilian military officers in 1963, they reported this to Washington, not Goulart. And in early 1964, when someone from the military asked U.S. Ambassador Lincoln Gordon how the United States would react to a potential change, he responded that the United States would provide help to the rebellion. The United States planned to make petroleum available, a U.S. naval force (including an aircraft carrier, destroyers, and missiles), arms, ammunition, and help in the event of a workers' strike.

The Brazilian Military Coup and Dictatorship (1964–1985)

By March 1964, the U.S. diplomatic mission in Brazil decided that Goulart was rapidly moving toward a communist totalitarian government. Gordon and the Brazilian army's chief of staff, General Humberto Castelo, agreed. Marshal Castelo Branco, who became Brazil's president following the coup, wrote and delivered a paper to U.S. military attaché Vernon Walters a week prior to the coup, justifying it. He and Walters had known each other since World War II, when Walters served as an interpreter.

During the coup of March 31 to April 2, U.S. warships remained on alert off the Brazilian coast. Gordon notified Washington immediately of the coup's beginning and President Lyndon B. Johnson's statement supported the new government's emergence "within the framework of constitutional democracy," even before Goulart officially stepped down, according to the historian Thomas Skidmore, who Jan Knippers Black (Human Rights Activist) quotes. Goulart left the country, asking his supporters not to fight.

This new military government promoted the National Security Doctrine. There were several hundred U.S. citizens in a variety of public positions, including advising the military and police. For example, the U.S. Office of Public Safety established Brazil's national police force, trained more than 100,000 police, and sent 523 to the United States for training. However, Brazil's trade with the USSR continued throughout the dictatorship and did not incur U.S. condemnation. For example, the USSR funded the building of several large hydroelectric plants.

Under Castelo Branco's reign, Brazil's congress was suspended for 2 years, and in his first month in power, 50,000 people were questioned and detained by police. The guerrilla movements were small and local, put down with arrests and torture. Nieto (2003) provides a Catholic Church report, which stated that "between 1964 and 1978, 488 priests and members of religious orders were imprisoned, 31 were tortured, 5 were murdered, 11 disappeared, and 28 were expelled from the country" (p. 172). In the 1970s, Brazil's government became more nationalist and regional and the repression slowly eased.

During the 1970s, Brazil also developed nuclear power, signing a nuclear cooperation agreement with West Germany and a uranium agreement with Israel. The West German agreement occurred after

the United States failed to provide the enriched uranium it had promised. U.S. vice president Walter Mondale later traveled to West Germany where he tried unsuccessfully to halt its nuclear cooperation with Brazil. From 1977 to 1985, Brazil also developed its arms export industry dramatically. It sold arms to Iraq, Syria, Iran, and Libya, often for oil.

Relations with the United States worsened. In 1977, under President Jimmy Carter, the Department of State produced a human rights' report for each country that received U.S. military assistance. Brazil was criticized for its repression. The day after Brazil saw this report, the U.S.-Brazilian military agreement (25 years old) was ended.

In 1985, the Brazilian government returned to democratic rule under President Joao Figueiredo and increased its role as a regional power. The more time that elapsed from World War II, the more Brazil developed and followed its own independent strategies. It did not follow the United States into either Korea or Vietnam. In 1971, Brazil and the United States both worked to accomplish a coup in Bolivia. However, by 1985, in the case of Nicaragua, Brazil was part of a group fighting for the Contadora Treaty in support of the Sandinistas, which President Ronald Reagan opposed.

Lessening Relations (1985–2005)

In the 1980s, the United States became less interested in Brazil, even ending the human rights' condition on aid that Carter had implemented. The two countries drifted apart on several issues, including the international debt crisis. By 1988, when Secretary of State George Shultz arrived in Brazil seeking support for U.S. policy in Central America, Brazil was completely disinterested.

During the 1990s, relations between the Brazilian president Fernando Cardoso and the U.S. president Bill Clinton were friendly. In 1995, the United States and Brazil signed an agreement to improve antidrug smuggling efforts along Brazil's western border. In 1997, the United States and Brazil renewed their agreement "Peaceful Uses of Nuclear Energy and Documentation," including technology and equipment transfers.

Relations were also friendly during the George W. Bush administration. Bush and the Brazilian president Luis Inacio Lula da Silva (known as Lula) visited each other a number of times, although they

held opposing political opinions on most issues. For the first time, in 2003, the Brazilian and American cabinets met together.

With the United States absorbed in antiterrorism after the attacks of September 11, 2001, Brazil was able to further increase its role as a leader in Latin America. Brazil criticized the U.S. attack on Iraq and did not join in. Furthermore, when Brazilians were among the groups that were required by the US-VISIT (United States Visitor and Immigrant Status Indicator Technology) program to be fingerprinted and photographed when entering the United States, Brazil responded by adding the same requirements for U.S. citizens entering Brazil.

Recent Events

In 2009, the Brazilian government announced it was forming a truth commission to investigate the alleged crimes committed by those in power during the military dictatorship. The BBC (British Broadcasting Corporation) reported that several military officials threatened to resign if the commission went forward, and it was initially delayed. Dilma Rousseff, the first woman president, was elected successor to Lula on October 31, 2010. She had been imprisoned and tortured during the dictatorship years and has revived plans for the truth commission.

Brazil and the United States have continued to clash over regional issues. Brazil disagreed with the U.S. decision to reactivate the U.S. Navy's Fourth Fleet in 2008 (disbanded in 1950). With the announcement coming shortly after Brazil discovered its new oil reserves, Lula questioned U.S. motives. Furthermore, in 2009, Brazil allowed the Honduran president Manuel Zelaya to take refuge in the Brazilian Embassy after he was ousted in a coup. The United States supported a new president and Brazil did not. And finally, Brazil's leading role in Haiti through the UN Stabilization Mission (2004 to the present) was upended after the 2010 earthquake in Haiti, with quick U.S. and European involvement.

The United States and Brazil also disagree over Iran's nuclear program. While Brazil argues it has a civil purpose, the United States wants sanctions. Brazil itself faced pressure when it became a nuclear state and points out that India and Israel faced no sanctions.

Yet the United States and Brazil also continue to work together. Brazil's defense budget has increased

significantly since 2006. In April 2010, Brazil and the United States signed the Defense Cooperation Agreement, the first since Brazil ended the previous agreement in 1977. Both sides agreed to increased cooperation. In addition to shared research and development, the agreement promotes combined military training and joint military exercises. Also in 2010, Embraer, a Brazilian aircraft manufacturer, began to offer training planes to the U.S. Air Force.

Civil-Military Relations

In conclusion, note the shifting purpose of the Brazilian military throughout its history. After Brazil's independence, the army and navy had two foci: (1) defense of Brazil's borders and (2) international action. Defense of the borders was the primary concern throughout the 1800s. International participation became a greater focus in World War I and World War II.

However, in the mid-1900s, in Brazil and in many other Latin American countries, the line between the military and political realms blurred. During the dictatorships, the military focused on internal security, encouraged by the United States. The threat was seen to be within its own borders, not external. With the return to democracy in 1985, the purpose of the military has once again transitioned.

The focus has moved back to defense of the national borders and international participation, cemented in the 2008 National Defense Strategy. Brazil has more than 10,000 miles of land borders and extensive seaways and ocean borders. Furthermore, the military was brought more firmly under the command of the executive sphere with the 1988 constitution and provides civilian services such as road construction.

The Brazilian military also plays a larger role externally, as a regional military power. It has a peacekeeping force in Haiti. Brazil aims to become a permanent member of the UN Security Council, is a leader of the G20 (a group of finance ministers and representatives from 19 countries plus the European Union), and was instrumental in stalling World Trade Organization negotiations in the Doha Round. Currently, Brazil can be viewed as either a military ally or competitor in the Western Hemisphere.

BRIGADE

The brigade cannot be understood in its modern sense without reference to the permanent command hierarchy that lies above and below it. In essence, the term *brigade* was born of the expansion of armies and the geographic space over which these large forces operated. This necessitated the practical step of creating levels (or hierarchies) of command through which a commander could influence the course of a battle or campaign when he was no longer able to personally order or supervise each and every principal subunit. Contemporary brigades usually comprise three to six battalions and can include other supporting units. This entry discusses the history of brigades and their organization.

Origins

The brigade is, in its modern sense, a creation of the gunpowder era and the expansion of national armies in the 16th and 17th centuries, and particularly the reforms of Gustavus Adolphus (1594–1632). He established a permanent hierarchical system of command based on the size and capability of different units in a building block format from smallest to largest. Each battalion comprised four companies of more than 100 men each and four battalions comprised a permanent brigade. His brigade is the equivalent today of either a modern regiment or brigade. Today, the term *battalion* is the nearly universal term for this level of combat formation comprising 500 to 1,000 people.

Napoleonic Era

Above the brigade, the next levels of command to be established were the division and corps. France first established a permanent divisional organization that encompassed all three arms, infantry, artillery, and cavalry, in the 18th century prior to the establishment of the armies of the Revolution after 1789. Napoleon Bonaparte (1769–1821) established the first permanent corps in 1804. These terms and their general concepts of a division grouping multiple regiments or brigades consisting of several battalions each, and a corps level of command grouping several divisions, remain the basis for combat organization through the 19th, 20th, and into the 21st centuries for the largest nations' land armies.

As the armies of the 19th century grew larger, and as warfare became the business of the whole people of warfighting nations, these hierarchical structures remained remarkably stable. An American Civil War Union or Confederate Infantry brigade commanding officer, following the maxims laid down in Baron Antoine-Henri de Jomini's *The Art of War*, would find the organization listed here in Figure 1 entirely logical for the organization of an infantry brigade. The U.S. Army adopted Jomini's *Art of War* as a textbook at the Military Academy at West Point, New York, in 1859. At the beginning of the American Civil War, artillery batteries were assigned to the infantry brigades. This followed the Napoleonic organization, which followed the disastrous Russian campaign of 1812 and was intended by Napoleon to buttress the weakness of the new

Figure 1 Position and Organization of the Brigade in the French Army of Napoleon ca. 1807

Source: Derived from Chandler (1966, p. 340).

infantry formations. This practice was abandoned by both sides very early in the American Civil War, and artillery was consolidated above the brigade level.

The First World War

As the First World War approached, the invention of the machine gun and quick firing artillery changed the organization and perspective of the principal national armies. The British Army and the U.S. Army each utilized the “square” division organization of two large infantry brigades with two regiments in each (Figure 2). This organization prevailed until the opening of the Second World War, while organizations above the corps became generalized in the term *army*, or *field army*, describing an echelon of command in which several divisions and the support necessary to sustain these divisions in the field became common.

The Second World War

Both the Anglo-American armies and the German army of the Second World War adopted a “triangular” organization within the Infantry Division with three brigade/regiment equivalents with three infantry battalions each (Figure 3). Only the British Army Infantry Division retained the term *brigade* for its three subunits, which were, in effect, regiments in the American and German sense, commanding a

Figure 2 “Square” Division: Position of the Brigade in the U.S. Army Infantry Division of the First World War circa 1918

Source: Derived from Lejeune (1930, pp. 288–289).

Note: Only the infantry combat units are depicted; artillery and other support services are intentionally not listed.

normal complement of three or more infantry battalions. These triangular formations and the essentially synonymous terms *brigade* and *regiment* were subordinated within a hierarchy of command levels beginning with the army group. The term *army group* denoted a higher command echelon that

included the direction for multiple field armies and became commonplace in the Second World War for the American, British, and German armies, while the Soviet Union used the term *front* to describe this level of command. Below the army group, the terms such as *army*, *division*, *corps*, *brigade/regiment*, *battalion*, *company*, *platoon*, and *squad* became the norm for modern armies to define the hierarchy of organization and command from the largest to the smallest tactical formations. For armies of millions of people, with multiple theaters of operations across oceans and continents, this hierarchy made practical sense for warfare involving the resources of entire nations.

Figure 3 “Triangular” Division: Position of the Brigade/Regiment in the Anglo-American and German Armies of the Second World War circa 1944

Note: Only the infantry combat units are depicted; artillery and other support services are intentionally not listed.

Into the 21st Century

Since 1945, no major war has been fought on the scale and lethality of the Second World War. Armies tended to become smaller and more affordable, although throughout the Cold War, the Soviet Union and the United States maintained millions of men and women in uniform necessitating the continuation of the highest forms of military hierarchy. Following the end of the Cold War, with regional and irregular warfare the norm across the globe and military forces much smaller in general, the term *brigade* has come into a renaissance of usefulness. As the forces deployed to fight have become smaller than their Second World War peak, the brigade, as a task-organized combat unit, commanded by either a brigadier general or a colonel, has become the primary hierarchical designation for the command of multiple battalion-level forces of all types (Figure 4). These brigade and brigade-equivalent formations are the backbone of modern combat operations built on battalion areas of responsibility in combat against principally irregular foes. These brigade organizations are highly task organized and represent in themselves the full range of ground combat, combat logistic support, air support, as well as medical and hospital units.

The modern form of the infantry brigade has changed from a level of command comprising simply infantry battalions within a larger force to one of the principal combat formations of major combatant nations. Task organized with all essential elements of combat power and combat support and logistics, these self-contained forces deployed to Afghanistan bear little resemblance to that conceived by Gustavus Adolphus. Their mission, however, as an essential

Figure 4 The 21st-Century Brigade/Regimental Combat Team: NATO Regional Organization—Afghanistan—ca. 2010

component of ground combat has not changed. The brigade, and its regimental combat team counterparts, remains one of the most powerful elements of modern warfare.

BUSH DOCTRINE

The Bush Doctrine is a series of concepts and policy ideas developed by the George W. Bush administration to address the threats of terrorism and nuclear weapons proliferation. This entry examines the development of the Bush Doctrine in response to the attacks of 9/11 and discusses al Qaeda as a new type of terrorist threat and the role of preemption in the Bush Doctrine.

President Bush's Response to Terrorism

The term first came into broad usage after the September 11, 2001, attacks on the United States, when Bush declared that the United States would use force against both terrorists and the states that harbor them. This concept justified military action against the al Qaeda terrorist network and against the Taliban government in Afghanistan since it had permitted terrorist bases in its territory and refused to turn over al Qaeda leadership after 9/11. Subsequently, Bush began to link terrorists and rogue states in pursuit of weapons of mass destruction, describing them as an Axis of Evil. Bush argued that these new threats required the United States to adopt new policies, including preemptive attacks. Many analysts came to refer to support of preemption as the Bush Doctrine, others used the term to include both the focus on new threats and the new tactics to be employed. The 2003 Iraq War moved consideration of Bush's ideas from the theoretical to the practical and placed them near the top of the world's agenda. Subsequent acceptance of the doctrine in the United States and globally thus depends in part on events in Afghanistan and Iraq, but since the ideas had a deeper history and logic, debate will continue well past the end of those wars.

Bush's policies against terrorism were new both in putting more focus on the use of force and in expanding the conflict to states that harbor terrorists. These tactics reflected not only Bush's personal style, which favored bold actions against clear enemies, but also came from widely held views that al Qaeda represented a new type of terrorist threat against which past antiterrorist actions were failing. In the past, terrorist groups usually had very narrow political goals and only a few poorly funded, poorly trained members. Al Qaeda reversed each of these traits. Its leader Osama bin Laden argued that Muslims across many countries had been oppressed by the West or the West's local allies. He was able to form an organization spanning many countries and thousands of individuals. Al Qaeda was also able to raise large amounts of money from sympathizers and other sources enabling it to buy much better equipment and establish training camps in Afghanistan. The newly powerful organization successfully attacked a number of locations across the globe in the 1990s. To combat al Qaeda's rise, most countries continued their strategies of treating

terrorism as a crime to be addressed through normal legal procedures. This strategy was judged ineffective as terrorism continued, so new policies were considered, including the use of force. In response to the 1998 bombings of two U.S. embassies in Africa, President Bill Clinton authorized investigations, but he also authorized missile strikes against targets in Sudan and Afghanistan.

Therefore, while Bush's response to terrorism differed in degree from past policies, it was not completely outside accepted views. There were some critics who felt that using force would lead to unjustifiably major loss of life on both sides, would not address the root causes of terrorism, and, in fact, could lead to further Muslim anger at the United States. Mainly, though, Bush's views and short-term actions were accepted both in the United States and abroad. To assess the longer term implications of the doctrine, one can compare Bush's antiterrorist doctrine to President Harry Truman's anticommunist doctrine. Both portrayed individual incidents as part of a global struggle against an evil ideology. Both rallied the public to support ongoing military actions, and both gave the United States a guiding foreign policy principle. Both also risked portraying a complex world in black-and-white terms, made the United States appear aggressive in some eyes, and centralized power in the hands of the executive branch.

Preemption

By the spring of 2002, Bush and his advisers were increasingly linking terrorists and rogue states. In June, at the United States Military Academy's graduation at West Point, Bush spoke about the need to address these new threats with new tactics. His views were more formally developed in the 2002 *National Security Strategy*. Bush argued that the Axis of Evil's mix of extremist views and modern military technology presented threats that could not be combated with Cold War ideas of containment and deterrence. The only way to defend the United States was to take the battle to the enemy by striking preemptively.

Preemption is an accepted strategy in international law, but Bush was using the term in a new way. International law and norms accept the idea that countries should have the right of self-defense. At times, though, waiting to be attacked gives the aggressor control of the timing and location of the

fighting. Therefore, if there is an imminent threat with enemy troops massing at their border, a country is allowed to preemptively strike first retaining the claim of self-defense. This is different from a preventive war in which a country attacks an enemy under the logic that it is better to fight a weak enemy now than risk dealing with a stronger aggressive enemy sometime in the future. Preventive war is generally not accepted in international law and norms. Bush's argument was that modern technology meant that there may not be troops massing at the border or any other clear sign of imminent attack, and therefore, the concept of preemption needed to be expanded to include more preventive actions. Administration officials often used the idea that, in the modern era, the smoking gun proof of threat might be a mushroom cloud.

Bush's ideas have been critiqued on a variety of points, but especially on the evidence necessary to justify preemption—Who should judge the evidence and take action? What precedents does the action set? Does preemption work effectively? If a preemptive attack is to be considered self-defense, there must be evidence of both capability and intent to attack. For example, International Atomic Energy Agency inspectors could find evidence that a country was pursuing nuclear weapons capability. Of course, the likelihood of finding definitive evidence is low since a country planning an attack might conceal its efforts by delaying inspections, building secret facilities, and so on. The difficulty in assessing capability was highlighted by the case of Iraq, which most analysts felt was pursuing nuclear and other weapons of mass destruction, but was then found to be much less further along than even conservative estimates had suggested. Even the presence of complete weapons, though, would not have proven threat, since Iraq may have intended to use the weapons only for deterrence or gaining international prestige. Evidence of offensive intent might include threatening statements from leaders or past violent actions, but again aggressive countries or groups may conceal their intentions.

Many international law scholars and other observers have argued that only the United Nations is allowed to weigh the evidence and authorize the preemptive use of force under current international law. The UN Charter recognizes that an attacked country may use force in self-defense in the short term without seeking UN approval, but even it

should later seek UN support. In all other cases, countries are encouraged to use other means to settle disputes or, in unusual circumstances, to show the need for collective UN action to restore international peace. In a strict reading of the UN Charter, any unapproved, unilateral use of force is thus in itself an act of aggression. This logic somewhat parallels the domestic idea that the police may use force to preempt a crime, but citizens doing so lack proper authority and become vigilantes who themselves could be punished. The Bush administration partially acknowledged these arguments by repeatedly bringing evidence to the United Nations and leading efforts to pass resolutions authorizing the use of force against Iraq, but they did not feel they needed a further resolution in the spring of 2003 to definitively authorize the war. Even without the UN system, one could make the argument that evidence justifying preemption should be weighed by a neutral panel, not a country already feeling threatened, but the Bush administration's counterargument would be that other countries or international bodies should not have a veto over actions a country judges are necessary for its self-defense. The Bush administration's strong support for unilateral actions in this and other cases has led some scholars to include "a willingness to act unilaterally" in their definition of the Bush Doctrine, although others would say that is more a tactical choice underneath the goals of the doctrine.

Some critics have argued that Bush's logic that modern weapons demand a looser standard of evidence in support of preemption, and that preemption can sometimes be unilateral action, may open a Pandora's box encouraging repeated wars. For example, if Israel judges Iran's nuclear program to be a threat, it could strike preemptively using the Bush Doctrine logic. Knowing this, Iran might judge Israel's possible actions as a threat and feel it should preemptively strike before Israel. Therefore, a major war could break out based on possibilities instead of definitive intentions. In theory, this same scenario could occur between the United States and Iran, although in reality, it is less likely that Iran would attack a major power. Therefore, the reality would be that existing powers would police the

world, preventing states they deem dangerous from attaining the weapons that the existing powers already have.

Effectiveness

A final major area of critique is whether the Bush Doctrine, in its focus either on terrorists and their supporters or on preemption, can ever be effective. Action in Afghanistan was first widely judged as successful in disrupting al Qaeda, and there has been no major attack on U.S. soil since 2001. However, despite 10 years of fighting and even bin Laden's death in May 2011, the Taliban has made a resurgence and al Qaeda terrorism has continued throughout the globe. In Iraq, the regime was toppled and any progress toward weapons of mass destruction halted, but there has been major loss of life and destruction, continued political instability, and much criticism of the United States for being overly aggressive. When preemption has been considered in other cases such as Iran, many have argued that minor military strikes would be only a temporary setback for a determined country, but major military action would create another Iraq. The concepts that the world faces new threats and that offense is the best way to address dangerous extremists remain popular though, so supporters would hold that the Bush Doctrine is a major step forward and that, if anything, the lessons of Afghanistan and Iraq are only about tactics, not goals.

CANADA

Canada covers nearly 4 million square miles and has almost 35 million inhabitants. It shares a long land border with the United States and a maritime border with Russia. Historically, besides its Native Americans Canada is composed of descendants of French and British immigrants, although an influx of immigrants from other parts of Europe, Asia, and Latin America since World War II has made the nation more ethnically diverse. Economically, Canada has a diversified industrial economy with significant wealth produced from petroleum exports, forest products, and wheat. Canada and the United States are major trading partners.

Canada has been a strong supporter of the United Nations and other multilateral institutions, including the World Bank, North Atlantic Treaty Organization (NATO), Organization of American States, and the British Commonwealth of Nations. In contrast to the United States, it has accepted jurisdiction of the International Criminal Court and the Convention to ban land mines. A hallmark of the Canadian military has been its participation in a number of peacekeeping missions since their inception in the 1950s.

Politics and Government

Canada is a parliamentary democracy, a federal system with significant powers granted to the provinces under the Canada Constitution Act of 1982. Elizabeth II of Great Britain is Queen of Canada and is represented by a governor general, who, since

1952, has been a Canadian. The House of Commons is popularly elected, and members of the Senate are appointed for lifelong terms by the governor general on the recommendation of the prime minister, serving until they reach the age of 75. Although the consent of the Senate is required to pass legislation, this unelected body generally influences the passage of laws through the amendment process. Under a parliamentary system, the prime minister is selected from the political party that commands the most support within Parliament. Elections must take place every 4 years, but they can be called earlier by the governor general—normally at the recommendation of the prime minister or if a government has lost the confidence of the House of Commons (i.e., failure of a budget bill or a vote of no confidence).

In contrast to the United States, Canada gained independence as a result of a long devolution of British power. Dominion status—control over internal affairs—came under the British North America Act of 1867. The Statute of Westminster (1931) granted Canada, Australia, and other self-governing dominions full sovereignty in the conduct of foreign policy, although until 1982 the assent of the British Parliament was required to amend the Canadian Constitution. A strong secessionist movement emerged in French-speaking Quebec in the 1970s.

Canada does not have a two-party system. Third parties play an influential role in Canadian politics, both nationally and locally. The Liberal Party has dominated Canada for much of the 20th and 21st centuries under strong prime ministers such as William Lyon MacKenzie King, Pierre Trudeau, and Jean Chrétien. In the election of 2011, the

Conservative Party of Canada under Prime Minister Stephen Harper won a commanding majority, and the New Democratic Party emerged as the Loyal Opposition with the Liberal Party falling to third place in the number of seats held in the Commons.

Canadian Military

Queen Elizabeth II and other members of the Royal Family maintain ties with many units of the Canadian military, often serving as colonels in chief. Constitutionally, the governor general serves as commander in chief of the military. Governor generals, as nonpartisan symbols of the nation, have often stressed during their terms in office the importance of honoring Canadian men and women for distinguished service or bravery, visiting troops in the field, and promoting public support of charities that aid servicemen and servicewomen. Several junior officers serve the governor general as military aides, and all military commissions are signed by the governor general.

Civilian control over the military resides with the Prime Minister and Cabinet through the Minister of Defence and the Department of National Defence and the Canadian Forces (CF). The Canadian Army, Royal Canadian Navy, and the Royal Canadian Air Force make up CF. There are two interservice operational commands: (1) Canadian Joint Forces Command and (2) Canadian Special Forces Command. The chief of defense staff is the senior-ranking commanding officer and is advised by the Armed Forces Council, which includes the chiefs of the naval, air, and land forces. Canada has traditionally relied on volunteers to fill the ranks of the armed forces, although during the two World Wars it did enact conscription that led to civil resistance in the province of Quebec.

Canada maintains small standing forces with an army that numbers 25,500 full-time soldiers organized into three infantry battalions, one armored regiment, one artillery regiment, and one combat regiment, along with other support troops. Army reservists number 16,000 and are dispersed in more than 100 communities.

The Royal Canadian Navy numbers 8,500 regular sailors and 5,100 reservists and has a fleet of 33 warships based in two commands in the Maritime Atlantic and Pacific. Frigates (*Halifax* class) with helicopter flight decks and destroyers (*Iroquois*

class) and four *Victoria*-class submariners make up the bulk of the fleet of the Royal Canadian Navy. During the Cold War, Canada's navy was tasked with responsibility for antisubmarine warfare in a possible conflict with the Soviet Union, but since 1989, the navy has been tasked to support a number of overseas operations, most notably during the Persian Gulf War.

The Royal Canadian Air Force has a fleet of 333 aircraft organized into 14 wings with 14,500 regulars and 2,600 reservists. The CF-18 Hornet serves as Canada's principal fighter aircraft, the CP-140 Aurora as Canada's maritime surveillance and anti-submarine aircraft, and the CH-146 Griffon as the principal tactical airlift helicopter.

Maintaining a military presence in the Arctic has been given added importance by successive governments as Canada has sought to assert its sovereignty in this region. Canada has not only sought to protect Canadian territory and honor commitments to NATO but also deployed troops around the world in peacekeeping missions. Critics have charged that too much is asked of a military in need of more advanced equipment, especially for ground troops. Although Prime Minister Stephen Harper has promised defense modernization and expansion, the costs are especially daunting for acquiring new combat aircraft and for maintaining an operational submarine fleet.

History

Canada and the United States remained fierce adversaries through much of their early histories. Though Canada was initially colonized by the French in the early 17th century, colonists of British North America fought alongside British regulars in a series of imperial wars against New France, leading to the eventual annexation of Canada into the British Empire under the Treaty of Paris (1763). During the American Revolution, the United States launched an unsuccessful invasion of Canada that, while succeeding at capturing Montreal, was turned back at Quebec. The American Revolution had a significant effect on Canada, as that British territory served as a place of exile for a large number of Loyalists fleeing the newly formed United States. In the War of 1812, the United States again tried to conquer Canada without success. Canadian militia played an important role in aiding British regulars in turning back American forces.

After the War of 1812, major territorial disputes continued into the 1840s. Great Britain maintained relatively few military forces in Canada after 1815, and the 1817 Rush-Bagot Agreement limited the number of warships on the Great Lakes and Lake Champlain. The prospect of war remained a possibility for American, British, and Canadian leaders into the 1920s. For instance, when running for President of the United States in 1844, James K. Polk threatened war if a territorial dispute regarding the Oregon Territory was not resolved in favor of the United States. British troops withdrew from Canada in 1871, excepting Halifax and Esquimalt, and Canada primarily relied on militia forces to defend the nation. Canadian troops did participate in the Boer War in South Africa (1899–1902).

Canada underwent a major mobilization during World War I. In 1914, the Canadian regular army numbered only 3,000; by the end of the conflict in 1918, this country of 8 million managed to raise armed forces numbering 625,000. Canadian land forces distinguished themselves throughout the war, most notably during the battles of the Somme and Vimy Ridge in France. A total of 67,000 Canadians were killed in action compared with the number of Americans killed in the war (approximately 53,500). Although Canada entered World War I as a loyal member of the Empire, the conflict played a decisive role in strengthening Canadian nationalism and altered Canada's relationship with Great Britain. During the interwar years, Canada increasingly carved out an independent foreign policy. In 1927, Canada sent a minister to its newly established Legation in the United States and no longer relied on the British Embassy in Washington, D.C.; the American government reciprocated by sending a representative to Ottawa.

The growing threat of Nazi Germany led President Franklin D. Roosevelt to strengthen ties with Canada, aided by his close personal relationship with Prime Minister King. When King George VI stayed at Roosevelt's personal residence at Hyde Park, New York, he was accompanied by King. In contrast to 1914, when Canada went to war as part of the British Empire, the Canadian Parliament issued a separate Declaration of War 1 week after the invasion of Poland in September 1939. In 1940, King and Roosevelt created a Permanent Joint Board on Defense and began joint planning for the defense of North America. Prior to Pearl Harbor, the

United States allowed American citizens to join the Canadian military without losing their citizenship. Once the United States entered the war, a substantial number of American forces were stationed in Canada, and the U.S. army built a major highway to Alaska through Canadian territory.

The bulk of the Canadian war effort centered on the war against Nazi Germany, although a contingent of forces participated in the unsuccessful defense of the British Crown Colony of Hong Kong in 1941. The Royal Canadian Navy played an instrumental role in the Battle of the Atlantic, expanding to a force of 900 vessels with more than 106,500 service members during the war. Canada created a land army of nearly 700,000 men and women who saw significant action in the campaigns in Sicily, Italy, the Normandy invasion, and the battles for France and the liberation of the Netherlands.

During the early years of the Cold War, the United States and Canada established an early warning radar system that stretched across Western Canada and the United States. In 1958, the two nations created the North American Aerospace Defense Command for defense of North American air space. Canada participated in the Korean War, contributing army units to the British Commonwealth Brigade and later Division. Canada was an original member of the NATO alliance and maintained ground groups in Germany from 1951 until the late 1980s to counter a possible Soviet invasion of Western Europe. During the Cold War, Canadian policies diverged from those of the United States in several crucial areas. Canada did not join the American war effort in Vietnam and allowed more than 50,000 American draft resisters to take up residence in the country. When Fidel Castro came to power in Cuba in 1959, Canada did not end diplomatic relations with this Communist nation. Canada participated in the first war against Iraq in 1990 but refused to support the second war to topple Saddam Hussein in 2003.

Afghanistan

The war against al Qaeda and the Taliban in Afghanistan is Canada's longest conflict, lasting more than a decade to date. More than 160 Canadians have died thus far, including soldiers, a diplomat, civilian aid workers, and a journalist. Only the United States and the United Kingdom have experienced higher losses. On a per capita basis, Canada

has lost more men than the United States. Polls indicate that most Canadians support the war—except in Quebec where a clear majority always opposed participation—and respect the sacrifices made by CF personnel. Yet most Canadians also back their government's choice to remove combat forces from Afghanistan in 2014. Many Canadians are also concerned about the possibility that war costs could exceed \$11 billion and that poor equipment could have led to the deaths of Canadian soldiers early in the war. There are also concerns about the war's less savory aspects, including allegations that detainees handed over by Canadians were tortured by Afghan authorities, mounting civilian casualties inflicted by Allied forces, friendly fire losses, endemic corruption in Afghanistan, and Pakistan's destabilization.

The initial rationale for Canadian participation in Afghanistan appeared simple. Al Qaeda's 9/11 attacks on the World Trade Center and the Pentagon constituted an assault on Canada's most important ally, an assault that killed more than 20 Canadians. So when U.S. forces began attacking Afghan targets on October 7, 2001, Canadian officers on exchange with U.S. armed forces were instructed by Prime Minister Jean Chrétien's government to take part. Within days, the Canadian government announced Operation Apollo, a plan to send naval forces, Joint Task Force 2 (Canada's Special Forces), and some ground troops to Afghanistan for a 2-year commitment.

Canadian participation in the conflict, however, aroused significant debate in Canadian policy circles as time went on. After the horrifying wars in Yugoslavia, Somalia, and Rwanda in the 1990s, many Canadian policymakers believed that Canada's traditional peacekeeping model was obsolete. Instead, a more robust "peacemaking" model, as exemplified by NATO's war against Serbia in 1999—a war Canada had joined—had gained sway in Ottawa before 9/11. This opinion about the efficacy of force was replicated in the United States, under Presidents Bill Clinton and George W. Bush, and in Great Britain under Tony Blair. Supporters of participation also benefited from the fact that U.S. and Afghan forces toppled the Taliban regime by December 2001, giving the appearance that Canada's role in Afghanistan would be "early in and early out." Canadian soldiers saw combat in early 2002 and did well; in particular, their sniper teams

won American plaudits. But in April 2002, four Canadian troops died when a U.S. plane bombed them during a nighttime training exercise, an incident that rankled as the pilot refused to accept blame.

With the "hot" war apparently over and the Taliban and al Qaeda forces on the run, in winter 2002–2003 Canada's troops, 2,000 strong, shifted to a peacekeeping-like role in the UN-mandated and NATO-led International Security Assistance Force (ISAF) that secured the capital of Kabul. While Canada's government supported the ISAF, the CF chafed. Eventually, three factors shifted Canada away from support for the ISAF. First, Prime Minister Chrétien's refusal to join the U.S.-led attack on Iraq unless it was mandated by the United Nations soured relations with the Bush administration. There was thus a perceived need in Ottawa to act more assertively in Afghanistan in support of U.S. goals. Second, Paul Martin, who replaced Chrétien in late 2003, sought a more robust role for the CF in Afghanistan, in part to address his public rejection of any Canadian part in the George W. Bush administration's plan for a continental ballistic missile defense. Seeking to carry out Martin's view of a 3-D approach—an emphasis on defense (security), democracy (governance), and development (reconstruction)—and with the United States preoccupied with Iraq, Canadian officials saw an opportunity to innovate in Afghanistan. They established a Provincial Reconstruction Team, a group of civilian and military advisers capable of providing aid and security in a designated area. After some searching, Canada settled on the vital province of Kandahar, the heartland of the Taliban movement, on the advice of General Rick Hillier.

Hillier's role in the switch was vital. A straight talking and personally engaging career soldier, an unusual personality as Canadian generals have tended to be quiet in public since the military failed to stop military unification in the 1960s, Hillier, having served and trained with the U.S. forces, wholeheartedly adopted the Marine Corps' notion of the "three-block war": that peace operations, humanitarian assistance, and combat would be comingled in most post-Cold War operations. Moreover, Hillier, who led the ISAF in 2004, believed that the CF, long starved of resources, could use the war in Afghanistan to effect a dramatic transformation into a robust and publicly supported military capable

of projecting power internationally alongside its U.S. and British allies. Hillier's ascension to the post of Chief of the Defence Staff in 2005 solidified the choice of Kandahar. Having rejected other quieter regions, Hillier and the CF saw Kandahar as the "linchpin" of Afghanistan, especially as the large U.S. air base near Kandahar City would add to Canadian capabilities while minimizing financial burdens. So after Canada's role in the ISAF ended in December 2005, a Canadian combat team of 2,500 troops arrived in Kandahar in 2006, and Canada's new minority Conservative government, led by Prime Minister Stephen Harper, extended Canada's mission in the country, slated to end in 2006, to 2008.

The Kandahar mission proved far "hotter" than anticipated due to the resurgence of the Taliban after the United States became mired in Iraq. Aided by allies in Pakistan, the Pashtun-dominated Afghan Taliban returned in force to the battlefield in 2006, and allied casualties mounted, notably in Helmand Province where British forces were situated and in Kandahar. Given the vast disparity in firepower, the Taliban's preferred weapon was the improvised explosive device. Prior to 2006, the CF had lost just eight men (including the four killed in the friendly fire incident noted above). Thirty-eight Canadian soldiers, however, were killed in 2006 alone, many more were wounded, and Canada's senior diplomat assigned to the Provincial Reconstruction Team was also killed by an improvised explosive device. Canadian losses were far higher than most other allied contingents because of inadequately protected vehicles, a shortage of helicopters that required vulnerable ground-based convoys to supply outlying military posts, and a Canadian tactical practice, borrowed from peacekeeping operations, of moving deliberately and visibly among the local populace to build trust and enhance cooperation.

As Canadian participation continued, mounting losses plus increasing concern about the war's nature and the ineffectiveness of President Hamid Karzai's Afghan regime ensured that the conflict became more controversial in Canada. Opposition grew as the death toll rose, except in the province of Alberta, where support for the war was much stronger than the rest of Canada, and in Quebec, where opposition had always been strong. In 2006, the head of the left-of-center New Democratic Party, Jack Layton, averred that Canada should abandon its combat

role and use the savings to fund social programs and health care. Others, forgetting that Liberal governments under Chrétien and Martin had incrementally committed Canada to Afghanistan, attacked Prime Minister Harper's support for the war as proof that he, like Blair in Britain, was George Bush's "poodle." Seeking to assuage these concerns and to tie the opposition Liberals more firmly to his own government's Afghan policy, in late 2007, Prime Minister Harper appointed the former Liberal foreign minister, John Manley, to head a bipartisan panel to investigate Canadian policies in Afghanistan and to recommend any changes.

The Manley Report, released in January 2008, criticized Liberal and Conservative governments for failing to manage the war effectively and for not telling Canadians why the war was being fought. While CF efforts were lauded, the panelists argued that the government, not the CF, had to set policy. They recommended that Canada's military role, slated to end in 2009, should be renewed if another ally committed at least one more battle group to the fight for Kandahar. They also emphasized that Afghan security forces should be trained to take up more of the combat burden. Canada's International Development Agency drew particular criticism for subsuming its efforts in multilateral initiatives that did little to publicize Canadian efforts and for a security policy that meant that its personnel rarely left Canadian encampments. Manley argued that Canada's International Development Agency should focus on a small number of high-value development projects such as the reconstruction of dams.

The report prompted changes. A new Afghanistan Task Force, situated in the powerful Privy Council Office, was created to coordinate the efforts of all government departments, though this led to allegations of micromanagement. A civilian representative—the Representative of Canada in Kandahar—was sent to Kandahar to lead the non-military effort on the ground and to better coordinate the civilian and military efforts in theater. Though there was some resentment from CF officers, the new arrangement worked well. The military's Strategic Advisory Team–Afghanistan, formed by Hillier in 2005 to advise the Karzai government about streamlining procedures, was also dismantled in 2008. Canada's Department of Foreign Affairs and International Trade had never been a fan of

Strategic Advisory Team–Afghanistan. The body was terminated when leaked documents suggested that Strategic Advisory Team–Afghanistan could be accused of drafting policy for the Karzai regime, not merely advising it.

A key aspect of the Manley Report, the need to set a withdrawal deadline if no allied combat aid was forthcoming, was taken up by Prime Minister Harper, who announced in late January 2008 that CF combat troops would be removed in 2011 if help did not come. A promise of U.S. aid came; however, after a Parliamentary debate in March 2008, the New Democratic Party and the separatist Bloc Québécois voted against maintaining a Canadian combat force in the country until December 2011. The Liberals supported a Conservative motion in favor of maintaining Canadian combat in the country until then.

Canada withdrew its combat task force at the end of 2011, but it continued to participate in NATO Training Missions aimed at improving the military effectiveness of the Afghan forces. As of 2012, 950 Canadian troops served in this mission. Plans call for a full withdrawal of these forces by 2014.

Canadian public support for the Karzai government also had declined in recent years. After 2 years of rumors, Richard Colvin, a Department of Foreign Affairs and International Trade official who served in Afghanistan in 2006–2007, reported to a Parliamentary committee that the CF knew that the detainees it was handing over to the Afghan authorities had been tortured, but both Hillier (now retired) and the government denied these claims. Canada's minority government nearly fell when it refused to release relevant documents concerning this issue in an unedited form. Only a compromise that allowed select Parliamentarians to examine the material eased political tensions. The questionable reelection of President Karzai in late 2009 and Karzai's subsequent assertion that he would join the Taliban if foreign interference in governance did not end alienated many in Canada and the West generally. The "surge" by U.S. forces, announced by President Barack Obama in late 2009, intensified the war and resulted in more casualties for the allies, the Taliban, and the Afghan civilian populace. Although the surge did meet with some success against Taliban forces, it is uncertain whether it dealt a decisive blow to the insurgency and whether the Karzai government can survive the withdrawal of all Western force. Some fear that the conflict in Afghanistan, like

the U.S. departure from Vietnam in the mid-1970s, could come to form Canada's first military defeat.

CARIBBEAN

The Caribbean archipelago is made up of around 7,000 islands and stretches more than 2,500 miles from the Bahamas to Trinidad. Terrain is varied and ranges from high volcanic mountains such as Jamaica's Blue Mountains to limestone hills and plateaus and flat lowland areas often resulting from coral deposition. The tropical climate is moderated by prevailing winds and has distinct rainy (May–November for much of the region) and dry seasons. Hurricanes can occur between June and November. Levels of rainfall vary geographically with windward mountain slopes receiving significantly more precipitation than leeward areas, which can exhibit semiarid conditions. Islands with lower elevation can also receive less rainfall on average.

The cultural landscape of the Caribbean is varied as well. Reflecting the colonial influence of a range

of European powers, the Caribbean is a tapestry of Dutch, English, French, and Spanish language and culture. Depending on the location, most areas of the Caribbean have predominantly African-derived populations, largely a reflection of the Diaspora. Post-Diaspora immigration from other world regions also brought immigrants from other areas such as South Asia to specific areas (e.g., Trinidad). Due to the rapid decimation of their numbers on contact with Europeans, Native Americans have had limited impact demographically and culturally on most parts of the Caribbean. This entry discusses the politics and history of the Caribbean, with a focus on U.S. military involvement in countering drug trafficking and money laundering in the region, and U.S. humanitarian aid to Caribbean countries.

Political Landscape

A range of political systems exists in the Caribbean, with democratic governments in all countries except Cuba. Two-party systems exist mostly in the former British colonies such as the Bahamas, Barbados, Jamaica, and Trinidad. In some of these systems, such as Trinidad, one party has traditionally been dominant; but more commonly, as is the case in the United States and Britain, control of the government tends to be cyclical, with power rotating between the two largest parties. Multiparty democracy can also be evidenced in the Caribbean in which legislative seats are awarded according to the number of votes each party receives, allowing even small parties to often have representation. Haiti is an example of the latter with more than two dozen active parties. In the smaller Caribbean microstates, single-party democracies have long been the norm as many of the nations lack the population and political/social diversity to sustain multiple, vibrant political parties with distinct agendas. Authoritarian (often euphemistically and erroneously described as “one-party”) systems have also existed in the Caribbean, wherein dissenting views/parties have been deemed illegal, with Cuba and the short-lived (1979–1983) Marxist regime of Grenada serving as examples.

Contemporary History

As historical remnants of the colonial era, four foreign powers retain possessions in the Caribbean: Britain, France, the Netherlands, and the United States. British possessions include the British Virgin

Islands, Anguilla, the Cayman Islands, Montserrat, and the Turks and Caicos. Islands under French control include Guadeloupe and Martinique, which are regarded as French Departments and send democratically elected representatives to the National Assembly, as well as St. Barthelemy and a portion of St. Martin, which are classified as Collectivities rather than Departments. Areas under Dutch control include the Netherlands Antilles—Aruba, Bonaire, and Curaçao—and also St. Martin, control of which is divided with France.

The United States has long had a formal presence in the Caribbean, acquiring Cuba and Puerto Rico in the Spanish-American War of 1898 and purchasing its Virgin Islands Territory from Denmark in 1917. Both Puerto Rico and the U.S. Virgin Islands maintain a tradition of limited local control while remaining territorially part of the United States. Since the mid-20th century, Puerto Rico has had the right to elect its own governor and draft its own constitution. It is not autonomous, though it is self-governing in local affairs, with the United States retaining full control of foreign relations and defense. A movement advocating full independence was active in previous decades. However, at present, the majority of Puerto Rico's electorate is divided on the issue of either becoming a U.S. state or remaining a Commonwealth and continuing to enjoy the economic advantages offered by this status such as the absence of federal income tax. The U.S. Virgin Islands have had limited control of local affairs since 1968, and at the polls, its inhabitants have repeatedly rejected both closer association with the United States as well as increased autonomy.

U.S.-Caribbean Involvement Since the Cold War

The collapse of the Soviet Union and communism facilitated a number of significant changes in the nature of U.S. relations with many world regions including the Caribbean. Previous U.S. foreign policy was driven by politicized foreign policy initiatives reflecting support for noncommunist regimes and for containment of socialist, anti-U.S. agendas in the region. Following the Cold War, U.S. policy in the Caribbean, which as a region has been described by the White House as America's “third border,” was in many respects reoriented to reflect shifting national interests, primarily toward efforts aimed

at supporting democratization and also combating crime, corruption, and international terrorism.

Recent economic decline in the agriculture, tourism, and other sectors and associated rising unemployment rates have contributed to increased prevalence of economically motivated crime in some parts of the Caribbean. The incidence and nature of crime, including violent crime, varies widely among countries, and local residents are in general more likely to be victimized than tourists. However, crime poses a significant security issue for many areas of the Caribbean. As a whole, the region's murder rate is several times higher than that of the United States and Canada. As of 2005, Jamaica had the highest murder rate in the world, with 60 murders per 100,000 people in the population. High and increasing levels of violent crime have also been characteristic of Trinidad and Tobago, Haiti, and even some of the smaller countries such as St. Lucia. Much of the violence is perpetrated by gangs involved in narcotics trafficking, kidnapping, and extortion. However, it should be stressed that not all areas of the Caribbean have experienced high rates of crime, and many areas such as Bonaire, the British Virgin Islands, the Cayman Islands, and Montserrat are considered very safe.

Drug Trafficking and Money Laundering

The principal areas of U.S. interest relative to security and criminal activity in the Caribbean are the illicit drug trade and the prospect of international terrorist groups using the region as a transit point or base of operations. Geographical proximity to the United States makes areas of the Caribbean suitable for smuggling various drugs including cocaine, heroin, and marijuana. Most Caribbean islands are merely transit points for narco-traffickers, but two countries, Jamaica and St. Vincent and the Grenadines, produce and export large quantities of marijuana. In 2006, the U.S. government designated 4 of the 16 nations of the Caribbean as major drug-producing or drug-transiting countries relative to the U.S. market: (1) the Bahamas, (2) the Dominican Republic, (3) Haiti, and (4) Jamaica.

Since the 1990s, U.S. military and law enforcement agencies have had an increased presence in the region, working to investigate and also interdict the flow of narcotics or unauthorized persons into the United States via, among other methods, patrolling air and sea transit corridors. In this expanded role, the

U.S. military has also provided significant materiel and logistical support and training to Caribbean military and law enforcement agencies in the arena of drug interdiction as well as post-9/11 antiterrorist efforts. The Bahamas and the Dominican Republic both cooperate closely with U.S. authorities on interdiction and other counterdrug measures. Concern exists that as the sugar and banana industries continue to decline in much of the Caribbean, it will be increasingly difficult to prevent cultivation of marijuana. Of broader concern is the potentially destabilizing effect drug-related and other criminal activity may pose for many nations, especially the microstates of the eastern Caribbean.

Closely tied to narco-trafficking and other criminal activity in the region is the presence of money laundering. The involvement of many Caribbean financial institutions in money laundering first received the attention of the U.S. government in relation to anti-drug-trafficking efforts. However, efforts to combat money laundering have also become an issue of national security as a key element in the war on international terrorism. The U.S. Department of State has identified five Caribbean island nations (and also the Cayman Islands, a British dependency) as significant sources of money laundering: (1) Antigua and Barbuda, (2) the Bahamas, (3) the Dominican Republic, (4) Haiti, and (5) St. Kitts and Nevis. Many of these nations such as the Bahamas have been proactive in addressing the problem of money laundering in recent years, due in part to U.S. pressure to safeguard against financing terrorism internationally. Governmental and business leaders in some Caribbean nations have complained that new financial regulations aimed at curtailing money laundering have undermined and complicated the financial activities of legitimate businesses and investors and have had unintended negative effects on the banking sector.

U.S. Aid

Although narcotics interdiction and antiterrorist efforts are relatively new roles for the military in the Caribbean, not all aspects of U.S. policy toward the Caribbean or military involvement in the region have changed since the conclusion of the Cold War. U.S. Southern Command headquartered in Miami and under its authority the Fourth Fleet of the U.S. Navy holds responsibility for military operations in the region. Both entities continue a long-standing

U.S. tradition of goodwill operations, humanitarian assistance, and military exercises, including joint training initiatives in the region. Examples of U.S. goodwill missions can be seen in Haiti, wherein U.S. forces safeguarded democratically elected governments in 1994 and again 10 years later and helped provide a security presence and logistical support for the Haitian government in the wake of the devastating 2010 earthquake.

As one of the world's largest providers of food, medical, and other humanitarian aid and developmental assistance, the United States has long played a significant role in helping safeguard the well-being of the people of the Caribbean. Often, U.S. humanitarian and developmental support is provided via military resources and logistical capabilities, as in the case of natural disasters such as hurricanes. Levels of U.S. aid to the Caribbean have generally been increasing since the 1990s, reflecting increased support for AIDS/HIV programs, disaster and reconstruction aid in the aftermath of hurricanes and other natural disasters, and increased funding for peacekeeping and democratization support. In 2005, U.S. aid to the Caribbean totaled around \$370 million, roughly one fifth of the U.S. aid budget to the hemisphere. Historically, Haiti has received the largest share (approximately 47% in 2000–2005) of U.S. aid to the Caribbean, followed by the Dominican Republic and Jamaica.

Trade Patterns

Interesting patterns of trade relations exist between the Caribbean and the United States. Since the 1980s, the United States has offered duty-free or reduced tariff arrangements on certain products imported from many Caribbean countries. In 2000, the Caribbean Basin Trade Partnership Act expanded U.S. preferential trade policies to include certain textile products. The Dominican Republic and Trinidad and Tobago have been the primary beneficiaries of such trade agreements, and both have significantly increased their exports to the United States. However, other nations have not been as successful, and over the same period, their export levels to the United States have remained flat or even declined. U.S. exports to the Caribbean have increased in recent years, rising from \$8.9 billion in 2001 to \$12.3 just 4 years later. Most U.S. exports to the Caribbean go to just four nations: (1) the Bahamas, (2) the Dominican Republic, (3) Jamaica, and (4) Trinidad and Tobago.

Historically, the United States has maintained a positive balance of trade with most Caribbean nations, the one exception being Trinidad, which exports fossil fuels to the United States. In short, the United States is more important as a market for Caribbean exports than the region is important to the United States as a customer base for its products. Progress has been made in promotion of regional and intra-regional free trade, and most Caribbean nations are participating in talks concerning the Free Trade Area of the Americas.

CEMETERIES, MILITARY

The 19th century witnessed the establishment of military cemeteries. The horror of modern, industrialized warfare and the ability of bureaucratic nation-states to field vast armies necessitated the creation of public spaces specifically dedicated to honoring the fallen. Military (or national) cemeteries often occupy picturesque locations (like the bluffs overlooking Omaha Beach in Normandy, France) and are usually designed with the object of creating a contemplative or reverent atmosphere. The grave markers themselves—often unremarkable and uniform white

marble stones or religious symbols—project an egalitarian image of war dead that serves to highlight the sacrifices of common soldiers and obscure differences in rank. Modern military cemeteries are also significant cultural artifacts that have been used to forge a sense of national unity. Out of common sacrifice, it is thought, comes common purpose. Military cemeteries, particularly in the latter half of the 20th century, have also featured design elements—both religious and neo-Classical—that are designed to remind the living of the human cost of war and the nobility of sacrifice in service to the body politic. This entry discusses the history of military cemeteries, with a focus on U.S. military cemeteries from the Civil War to the present.

Origins of the Military Cemetery

Archaeological evidence suggests that the earliest humans placed a special significance on those who had died in battle or by otherwise violent means. Researchers have uncovered skeletal remains exhibiting signs of combat that have been carefully prepared for interment and buried with grave goods such as weapons and religious objects, presumably to be used in the afterlife.

Ancient literature is littered with anecdotal examples where war dead have been recovered from distant battlefields and buried with elaborate and public funeral rites. The ancient Greeks commonly eulogized their war dead and carefully recorded the identities of the fallen if the remains were not always recovered and identified. The Spartans are credited with instructing their warriors to return home brandishing one's shield or lying prostrate on it. Warfare during this period was often characterized by close-order combat, and the grisly aftermath of battle frequently left fields with small mounds of bodies where men had often been crushed and suffocated. The bodies, exposed to the elements and animals, were often stripped off armor and weapons and placed in graves near where they died.

The fallen in ancient Rome were also accorded respect, and many were honored with proper burials, including stone grave markers and monuments, often carved with the name, unit, and exploits of the deceased. War dead were also honored with public feasts. Grave sites carried a religious significance and were visited by one's relatives. There is also evidence that Roman legions cremated their fallen

comrades and sent the ashes home to the families. Expediency dominated battlefield funerary practices during the Medieval period. The depravation of siege warfare and the increasing lethality of weapons technology—along with concerns about disease and the smell of death—may explain why most of the fallen were summarily relieved of their armor and buried in mass graves on the battlefield. To be sure, the remains of nobles and soldiers from the elite were often escorted back to their home countries—sometimes at great expense—and afforded burial in churchyards whenever possible. This stratification—even for the military dead—continued well into the modern era. Until the late 19th and early 20th centuries, even prosperous states failed to adequately inter and memorialize the remains of common soldiers who fell in service to their country. Most of the remains of those who died in battle, until very recently, were hastily buried in mass graves or trenches without markers or ceremony. Soldiers, as subjects of the state who were often pressed into service, seldom merited proper burials, according to military and political elites.

The democratically inspired upheavals in late 18th and early 19th centuries—particularly the French Revolution and the Napoleonic Wars—ushered in a transformation in the way Western societies conceived of and honored their war dead. Modern, ostensibly democratic nation-states could no longer neglect the sacrifices of the common soldier. European governments erected monuments to the fallen, and respect for a country's war dead steadily grew among ordinary citizens into a phenomenon that many commentators and historians have described in pseudoreligious terms.

There is evidence that communities in Europe and the New World honored their war dead by burying them in a particular part of a municipal or churchyard cemetery, often marked with distinctive headstones and segregated from other plots by a physical barrier, such as a fence or a hedgerow. However, the first military cemeteries worthy of the name were conceived of and constructed in the United States during the Civil War. The already-breathtaking carnage of the American Civil War demonstrated, in bloody detail, that the prior ad hoc and largely privatized approach to dealing with war dead required a national and comprehensive approach. Waves of soldiers dying in the name of defending the Union and the democratic ideals embodied therein

required an appropriate response. Prior to the war, military dead were largely interred in small, hastily constructed cemeteries within the perimeter of a frontier military post or on a remote battlefield. Record-keeping and the identification of remains were often shoddy or nonexistent. Isolated burial sites in the field were often poorly marked, their location unrecorded. In September 1861, the War Department issued General Order No. 75, which stipulated that the U.S. Quartermaster General was required to provide for the burial of deceased soldiers and to keep records and erect wooden markers at grave sites.

Precedents Established by the Civil War and the World Wars

In 1862, the U.S. Congress went further and authorized the creation of a national system of military cemeteries to accommodate the mounting combat casualties and death from disease. The legislation, signed by President Abraham Lincoln in July 1862, established 12 national cemeteries, predominantly at the sites of military posts and hospitals. By the end of the war, more than 70 military cemeteries were established, including Arlington National Cemetery. This cemetery was initially created to provide burial plots for the dead who expired in army hospitals located in Washington, D.C. The selected parcel of land had been seized by the U.S. government; it formerly belonged to Mary Custis Lee, the wife of Confederate general Robert E. Lee. As many as 12,000 Union dead lay buried on the grounds of the former plantation immediately following the war. Confederate dead in northern soil often went unmarked and unacknowledged unless private citizens organized to locate and reinter the remains to southern states. In 1901, however, federal officials arranged for as many as 264 Confederate soldiers to be buried at Arlington, complete with distinctive headstones. Other national cemeteries soon followed suit and erected markers for Confederate dead in a gesture of national unity. The cemeteries at Antietam and Gettysburg among several other battlefield cemeteries, originally established by private organizations and their respective state governments, were passed to federal control as the system of national cemeteries grew throughout the 20th century.

The treaty that formalized the end of the Franco-Prussian War, signed in 1871, stipulated that both

sides would dedicate cemeteries to the remains of the war dead in their respective territories, regardless of the nationality of the deceased; however, it was not until the outbreak of the First World War that the great European powers established national systems of military cemeteries. The horrendous nature of the fighting, 19th-century infantry tactics running headlong into 20th-century weapons like gas and machine guns, produced appalling casualties—some 13 million dead—that, coupled with the dubious causes of the conflict, demanded a response from belligerent governments. By the end of the war, all of the major combatants had formalized their intent to disinter the remains of their fellow countrymen from temporary field cemeteries into permanent installations that could appropriately commemorate their sacrifice and, in some cases, to serve as sites to promote a particular brand of militaristic nationalism.

Two of the former combatants, Britain and Germany, created organizations to maintain these new national monuments. The British Commonwealth War Graves Commission and the *Volksbund Deutsche Kriegsgräberfürsorge* became the caretakers of dozens of cemeteries in Europe and elsewhere. The Commonwealth War Graves Commission, conceived as the Imperial War Graves Commission, was founded by Royal Charter in 1917, and today it consists of a board comprising representatives from several Commonwealth nations. While the casual observer can detect distinctive design elements when comparing the cemeteries of different countries, most hewed closely to the prevailing sentiments of modern cemetery architecture while often imparting ideologically informed messages about the meaning of wartime sacrifice. British cemeteries, for example, attempted to recreate an atmosphere evocative of rural English churchyards, complete with religious imagery, while the German *Totenburgen*, ominous and enclosed fortress-like structures, subsumed individual identity in the name of national unity and purpose. During the interwar period, these cemeteries became pilgrimage sites, and the wooden crosses that often adorned temporary field cemeteries became revered objects.

The U.S. government responded similarly to the sacrifices of U.S. service members during the Great War. The U.S. government contacted the next of kin to determine if they would prefer to have their loved ones repatriated to the United States or buried in a cemetery overseas (a majority chose to have the

remains returned stateside). The American Battle Monuments Commission (ABMC) was created in 1923 and charged with overseeing and maintaining the cemeteries located overseas and reserved for fallen American soldiers, sailors, and marines. ABMC officials designed aesthetically pleasing, park-like preserves complete with sculptures and chapels dedicated to honoring the memory of the fallen. Much like their European counterparts, American cemetery planners regarded the war dead with a reverence that was reflected in the design of the cemeteries. Many of the ABMC cemeteries were located on or near the sites of some of the largest and bloodiest engagements in which Americans fought. ABMC cemeteries contain not only a large number of the unknown dead but also the Tablets of the Missing, which list the names of servicemen whose remains were never recovered or identified. For the missing and presumed dead, these tablets are usually the only tangible monuments to their sacrifice.

As Europe and Asia descended into the global conflagration known as the Second World War, belligerent governments once again were forced to confront the problem of how to properly accommodate the millions of war dead on both sides. To be sure, the victorious Allies were able to bring more resources, both logistical and financial, to bear. Both the British and the American governments simply continued and refined many of the policies and practices from the First World War and added to the number of cemeteries they administered in western Europe. Both countries also established overseas cemeteries in all corners of the globe, including mainland Asia and the South Pacific.

The U.S. government, in particular, embarked on an ambitious program to recover and identify as many of their fallen military as possible. Teams of military investigators, mostly under the umbrella of the American Graves Registration Service, fanned out to all parts of the globe in search for war dead. American Graves Registration Service teams meticulously searched fields, forests, beaches, jungles, and remote mountain ridges in an attempt to recover unburied remains and exhume those found in isolated graves. Remains were usually then concentrated into regional, temporary cemeteries before they were eventually exhumed and formally identified. Here, new precedents were established as scores of forensic anthropologists and technicians were employed to do the painstaking work of identifying remains

often rendered unrecognizable by the horrors of combat. Identified remains were then transported to either the United States for final burial (in a national or private cemetery) or one of the newly established ABMC cemeteries in western Europe or the Pacific (along with the unknowns), according to the wishes of the next of kin. In the case of the United States, the work of recovering, identifying, and burying remains extended well into the 1950s. In Europe, the themes emphasized in post-World War II cemeteries changed markedly compared with those of the First World War. Whereas cemeteries created after the Great War extolled the ideologically tinged virtues of sacrifice on behalf of God and country, cemeteries built after the fall of Nazi Germany and the horrors that that regime inflicted on innocents, emphasized mourning those lost—often in a religious context.

Cemetery System Today

Today, the National Cemetery Administration of the U.S. Department of Veterans Affairs (VA) maintains 131 national cemeteries in 39 states as well as the District of Columbia and Puerto Rico. The U.S. Department of the Interior oversees 14 national cemeteries, many of which were established at the sites of historic battles, including Gettysburg National Military Park and Little Big Horn Battlefield National Monument. The Department of the Army is responsible for Arlington National Cemetery in Virginia and the U.S. Soldiers' and Airmen's National Home Cemetery in Washington, D.C. The ABMC maintains 24 overseas cemeteries for the war dead of the Mexican-American War, World War I, and World War II. Several states also maintain burial grounds for the remains of deceased service members and veterans.

Nevertheless, the VA operates the bulk of the resting places for deceased soldiers, sailors, airmen, marines, and veterans. Eligible persons are provided with below-ground burial or the interment of their ashes in a columbarium. Active-duty service members and veterans are buried at no cost to the family of the deceased. The VA furnishes grave markers that conform to existing memorials at the pertinent cemetery. The VA also provides U.S. flags that are draped over caskets and urns and presented to the next of kin. Military honors are arranged through and provided by the Department of Defense and include the folding and presentation of the burial flag

by uniformed personnel and the playing of “Taps” by a bugler. VA personnel and veterans organizations may also assist in such funerals. In 2007, military personnel and grieving family members buried as many as 101,200 veterans in national cemeteries, the bulk of whom served during World War II.

Interment in a national cemetery is restricted to those who died while on active duty, honorably discharged veterans, spouses and dependents meeting certain criteria, and those who served other governments allied with United States during a time of war and who died as a result of that service. Exceptions are also made for Merchant Mariners and members of the Philippine Armed Forces. The current budget (Fiscal Year 2013) projects an allotment of \$258 million for the operation and maintenance of the national cemeteries. The amount for the upkeep of the cemeteries represents a fraction of 1% of the VA budget, according to the most recent budget proposal.

Military cemeteries continue to serve as stark, often overwhelming, reminders of the sacrifices made during conflict. They also remain important cultural touchstones as they indicate how different societies view and honor their war dead and those who have served in the military with honor.

CENSORSHIP

The power of censorship is, according to *Webster's*, “to delete from letters, dispatches, [and other means of communication] any secret or forbidden information.” In warfare, the prevention of the loss of tactical or operational information that may have an impact on military operations giving the enemy an advantage has been of paramount importance. With the advent of modern warfare, the prevention of the decay of public morale supporting war aims has made “the war of words and ideas . . . part of total war.” Communication and the instruments disseminating information have become part of the psychological war zone for the hearts and minds of populations. This entry discusses types of censorship, self-censorship and the use of censorship by the U.S. military, and the role of cable news, the Internet, and WikiLeaks.

Censorship exists with propaganda as the primary tools in psychological warfare. Whereas the three major types of propaganda—(1) strategic propaganda aimed at the enemy’s home front or enemy-occupied lands, (2) tactical propaganda directed against enemy troops in the field, and (3) occupational propaganda carried on in territories wrested from enemy control—are offensive in nature, censorship acts as the defensive countermeasure to the said propaganda. Strategically, the use of censorship is aimed at preventing the loss of morale at home by limiting “bad” news and enemy propaganda. Tactically, censorship is focused on both preventing the loss of operational information to the enemy and preventing enemy propaganda from reaching one’s own troops. Occupational censorship attempts to limit or eliminate alternative information sources in those territories wrested from enemy control.

The idea of censorship runs counter to the ideals of the American Republic. The First Amendment to the U.S. Constitution states, “Congress shall make no law . . . abridging the freedom of speech, or of

the press.” Censorship by its nature runs counter to these freedoms as enshrined by the U.S. Constitution. For the United States, the military’s need for censorship during wartime and constitutional rights of freedom of speech and the press have created an ever-evolving relationship between the U.S. military and the press.

Committee on Public Information and World War I

On the home front, U.S. entry into World War I saw the creation of the Committee on Public Information (CPI) under the direction of George Creel to promote the American war effort. Creel actively sought to have the American press and people use self-censorship in order to avoid a First Amendment conflict. From Creel’s perspective, the use of censorship laws held the danger of “slipping over into the field of opinion.” The CPI had no legal authority to censor, nor did it ever request such power; however, the CPI could, and did, provide enormous amounts of publications, including their *Official Bulletin*, which newspapers had free use to republish. Creel and the CPI created an effective quid pro quo with the American press, providing publishers copious amounts of free copy while those publishers fell in line with the overall viewpoint of the U.S. government regarding the war effort. The few publications that did not embrace the CPI’s concept of self-censorship and that were openly critical of the war effort, like *The Masses*, found themselves banned from the mails by the Postmaster General. Technically, such periodicals could still publish, but their banishment from the U.S. Postal System effectively closed them down as businesses.

The self-censorship system was embraced by the public with such furor that symphonies avoided works by Mozart and Beethoven, *The Katzenjammer Kids* became the *Shennanigan Kids*, and sauerkraut was renamed victory cabbage. The public’s embrace of self-censorship allowed the U.S. Congress to pass a series of laws expanding the scope of the government’s ability to censor beyond the limits of the 1917 Espionage Act. This act was used to stifle the most ardent domestic critics of the war and sent socialist Eugene V. Debs and labor leader “Big Bill” Hayward to prison, reflecting the hard censorship used by the U.S. military at the European Front.

The military censored U.S. soldiers’ letters home. The U.S. military also accredited reporters on the front. Unlike the Spanish-American War where writers, such as Richard Harding Davis, had the freedom to roam and report what they wanted, reporters now had to be accredited by the U.S. military to have access to the troops and the front. Frederick Palmer, formerly of the *New York Herald*, oversaw the censorship of the U.S. press, including photography. The accreditation process proved a useful means of controlling the stories and images sent back to the United States. One area of press-military tension was of press criticisms of the Allies that were initially passed by U.S. censors but later received official complaints and revocation of press accreditation for the reporters.

Office of War Information and World War II

The U.S. involvement in World War II saw a variation of the implementation of the system used during World War I. President Franklin D. Roosevelt’s administration divided the control of war information into three basic components: (1) the Office of War Information providing government propaganda both at home and abroad, (2) a voluntary system of domestic news censorship overseen by civilian authorities, and (3) the mandatory military censorship operations for combat zones. Like the CPI, the Office of War Information provided massive amounts of free copy for American publishers, films for theaters, radio broadcasts for the airwaves and every other conceivable media outlet, producing an effective means of filling the marketplace with the official government view of the war. As in World War I, the Postmaster General could suspend the mail permit of any publication sent via the U.S. Postal System. Out of some 17,000 publications examined, only six permits were revoked during the entire war period. The voluntary system of self-censorship worked. The press followed the Office of Censorship’s published codes so well that General Dwight D. Eisenhower viewed reporters as “quasi-officers.” Press in the field dressed like G.I.’s, traveled with the troops, and shared many of the same dangers as the troops.

The system of self-censorship developed through the two World Wars did not function as well into the Cold War era. The Korean War proved to be

problematic for both the press and the U.S. military. Disagreements with the official U.S. military version of the war, the competitive nature of reporters trying to outcoop each other, and a lack of a clear code of what was publishable and what wasn't led General Douglas MacArthur to impose a formal system of censorship that lasted until his firing by President Harry Truman.

The Vietnam War

The problems between the press and U.S. military exposed by the Korean War grew with the long involvement of the United States in Vietnam. One problem from the view of the press was the ever-widening credibility gap between how the press viewed the war and the official U.S. government narrative that focused on "good news." Adding to the tensions was the dual system of accreditation in which reporters were accredited by both the United States and the Republic of South Vietnam. The loss of accreditation by either would lead to a reporter's expulsion from South Vietnam. Many American reporters were critical of the South Vietnamese military and did not agree with the official U.S. military narrative espousing the effort of the government that American troops were trying to defend against the Communist North. This skepticism grew greater over time.

On the home front, there was no longer a unified agreement among the American media for self-censorship. Books, like Arthur Schlesinger Jr.'s *Bitter Heritage*, critical of U.S. involvement in the war, appeared in print. Publishers and other media outlets did not limit criticism of the war to the extent they had during World Wars I and II. On February 27, 1968, in the aftermath of the Tet Offensive, the CBS anchor Walter Cronkite broadcast a commentary predicting "stalemate" rather than victory. Most media historians have analyzed Cronkite's grim assessment of the American position in Vietnam as following the existing public opinion regarding the war rather than leading it. For President Lyndon B. Johnson and many in the American government, the Cronkite commentary on the war effort had a grave psychological impact on the public. To President Johnson, the loss of Cronkite meant the loss of "Middle America." The battle for the morale of the home front had turned. The self-censorship

of World Wars I and II imposed on the press by itself no longer applied.

The release and publication of *The Pentagon Papers*, a large collection of archived, classified Department of Defense documents related to the Vietnam War, in June 1971, shattered the official system of censorship that allowed the U.S. government to define and protect what it considered government secrets when the U.S. Supreme Court refused the Nixon administration's appeal to stop the *New York Times* from publishing them. Many considered Daniel Ellsberg, the official who leaked *The Pentagon Papers*, a hero. The Supreme Court's decision effectively limited the government's response to attempting to punish the leaker of the information rather than trying to reassert control of the information, as is the case with the 2010–2011 WikiLeaks document dump on the Internet. The aftermath of the Vietnam experience forced the U.S. military to reexamine its relationship with the press during wartime.

The invasion of Grenada in 1983 provided the U.S. military a solution to the problems of controlling the press. The U.S. Navy simply excluded the press during combat operations. Given the short operational timeframe of the mission, the complete exclusion of the press worked. For the press, Grenada created an impetus to work within military guidelines in order to have access to the battlefield. The invasion of Panama in 1989 provided the first major opportunity for a new less adversarial relationship to develop between the U.S. military and the press.

The U.S. military imposed news pools as the condition for the press to have access to the battlefield. Japan had used the modern press pools to control the flow of information during the Russo-Japanese War of 1905. In Panama, as in Manchuria decades earlier, the use of news pools restricted press access to any area until after the area was secured and allowed for the military to manage the flow of information from the front back to the States. The press complaints of the news pool system related to the delay in reaching the best stories. As in the case of Grenada, the limited time of operations gave the U.S. military near carte blanche in limiting press access to the battlefield and little time for a counter-narrative of official information to develop on the home front.

The Rise of Cable News Network and Cable News

The months-long buildup to the Persian Gulf War (1991) created a new problem for the allied coalition built by the George H. W. Bush administration with regard to the press. Though the U.S. military asserted that all reporters were to be “escorted” at all times and limited the number of reporters with access to the front lines by “embedding” them with American or allied troops, it could not control Cable News Network (CNN) inside Iraq. Those news organizations that wanted access to the battlefield via the limited number of embedded reporters had to agree to rules proscribed by the U.S. military regarding what could or could not be reported. Reporters who were embedded with American troops became dependent on the same troops for their survival and part of the same “team” similar to the relationship between the press, or “quasi-officers,” and U.S. military in World War II. CNN however was operating inside Iraq and broadcasting via satellite to the world outside of the operational control of the allies creating an unprecedented situation of a major American network broadcasting from the battlefield and enemy territory to the home front without any censorship constraints imposed by the U.S. military or government but with the blessing of the state the United States was actively engaged in warfare with.

The rise of 24-hour cable news has created a unique anomaly in the history of warfare regarding the control of information and a paradox for Western democracies with a free press like the United States. The ability of multinational media corporations to gain access to foreign territories, often at the cost of editorial autonomy, and the strong historical aversion to imposing overt censorship on the press in the United States, makes the American policy theoretically vulnerable to the “CNN Effect” where foreign policy (and by extension war policy) could be altered or even managed by the type of images the public and policymakers are exposed to. Thus, while physical access to the war zone and American troops has become more restricted in the 21st century than it was in the 20th, the ability of the government to control or censor information on the home front has decreased.

Thus, the information reported at the home front may radically differ from the perceptions of those at the front or in occupied territory subject to

U.S. military control and may be an extension of the military censorship. So while the U.S. military and civilian leadership in Iraq after the fall of Saddam Hussein during the Iraq War could control the Iraqi Media Network they created to provide pro-coalition news for the newly occupied Iraq, no such control could be extended to CNN or Al-Jazeera’s broadcasts as they beamed into the United States via satellite.

Al-Jazeera

Al-Jazeera, modeled after Western news services, was created in 1996 with the purchase of the British Broadcasting Corporation’s Arabic television division by the Emir of Qatar. The network’s mission was defined to provide an alternative perspective and to be an “authentic Arab news source for Arabs.” Given Al-Jazeera’s mandate and its links to the Qatar government from which it receives operational expenses, the network has been described as having a “Pan-Arab” or “Pan-Islamist” point of view by Western media analysts, while many Al-Jazeera reporters view themselves as “anti-imperialist.” The combination of Al-Jazeera’s anti-imperialist viewpoint with the network’s access to al Qaeda and Taliban leadership has created a series of policy dilemmas for the United States and its allies with regard to censorship of Al-Jazeera.

Though the U.S. military bombed Al-Jazeera facilities in combat zones, whether accidentally or not, during both the Afghan and Iraq conflicts during the War on Terrorism, during the administration of George W. Bush, such measures were only temporary in effect and had limited tactical benefit. Given the popularity of Al-Jazeera in the Arabic world and its moderate stance regarding the United States compared with other Arabic media outlets, the United States has taken a policy of engagement of having prominent administration officials appear on Al-Jazeera to actively “engage” the Arabic media and the Arabic world. Barack Obama gave one of his first interviews as president of the United States to Al-Jazeera.

This policy of engagement has not extended to the home front. Al-Jazeera is largely unavailable on American cable systems. The cause is twofold. In a crowded marketplace of cable news filled by CNN, MSNBC, FoxNews, the BBC, and financial news channels, many cable providers look at Al-Jazeera

and think that “if it looks like the BBC, why should we add it.” Additionally, the fear of an economic backlash from their customers over the addition of Al-Jazeera to the local cable lineup has made cable providers reluctant to add the network as one of their offerings. These two elements, a glut of CNNs and fear of customer backlash, have effectively led the cable industry to keep Al-Jazeera off American cable television, replicating the system of self-censorship that has existed in the American media since World War I.

Abu Ghraib and the Internet

Though Al-Jazeera can be kept off cable systems and its reporters can be denied accreditation to the New York Stock Exchange, the Internet and social media have provided a means of communication nearly uncontrollable. The use of cell phone and digital photo technology easily uploadable to the Internet means that war images can appear simultaneously across the globe. This technological advancement has created major problems for militaries in controlling images from war zones, especially for the United States. In May 2004, the television program *60 Minutes II* revealed the existence of photographs detailing the abuse of prisoners held at Abu Ghraib prison by the U.S. military. The photographs taken by U.S. military personnel quickly spread across the globe to worldwide criticism of the American military and its failure to adhere to Geneva Convention protocols. Abu Ghraib illustrated the problem in the rise of the Internet and social media and the ability of military leadership to maintain censorship regimens among military personnel. Unlike previous wars where communication between troops and their families back home was primarily limited to mail service and later radio and phone technologies that could be fairly easily controlled by military censors, 21st-century troops can be connected to the home front in an instant via cell phones and the Internet in a second and often wirelessly. Additionally, the self-censorship position taken by the Western press has only worked when it has been nearly universally adhered to. The publication of information on the Internet breaks down the universality of self-censorship, making reliance on a voluntary system of censorship, as envisioned by George Creel, no longer applicable to the Internet age. The Abu Ghraib photos have been followed by photographs of U.S.

soldiers burning defiled Korans in Afghanistan and U.S. troops posing with enemy dead. Each case has complicated the military and diplomatic position of the United States and its allies and has given their enemies strategic, tactical, and occupational propaganda points to exploit.

WikiLeaks

The emergence of a “socially networked world” has created serious problems of controlling information from the front lines. It has also created serious problems in terms of maintaining secrets pertaining to national security. WikiLeaks, a website founded by Julian Assange, released Afghanistan war logs of the United States and U.S. diplomatic cables in a series of massive document dumps. While U.S. legal precedent allowed the Obama administration to bring charges against Bradley Manning, the U.S. Army soldier who provided the documents to WikiLeaks, WikiLeaks itself, like the *New York Times* in the *Pentagon Papers* case, is not criminally liable for the release of national security materials. However, unlike the *New York Times*, WikiLeaks did not have the ability to properly editorially vet the documents. Though WikiLeaks was subject to denial of service and cyber attacks after it released classified information, the damage of the release had already been done; *The Guardian*, *New York Times*, and *Der Spiegel* all published excerpts of the documents. Short of resorting to the “nuclear option” of shutting down the entire Internet, which is a practical improbability given the damage such an option would do, there seems little that can be done once information becomes available in any electronic form on the Web. The WikiLeaks case along with the release of photographs in the Abu Ghraib case illustrate the new dilemma created by the Internet, social media, and social networking with regard to the control and censorship of information during wartime.

Thus, an anomaly of a strong system of tactical censorship based on limited access to the front and “embedding” along with the creation of pro-occupational news entities like Iraqi Media Network exists with essentially nearly nonexistent strategic censorship for the home front with the rise of 24-hour multinational news media organizations operating outside the control or influence of the U.S. military though possibly under the influence of any

nondemocratic state in return for access and social media that exists with literally no editorial controls. For military operations of a short duration, the advantages of the tactical censorship are obvious. However, for any prolonged military engagement or military occupation, the lack of strategic censorship can create the conditions for loss of morale on the home front.

CENTRAL AMERICA

Because of its location, Central America has played a key role in determining the political, economic, and military security of the Western Hemisphere. Throughout the 20th century, Central America held tactical and economic interests for many nations, including the United States, because of its strategic setting near the Caribbean Sea, the southern coast of the United States, and the Panama Canal. Historically, the extreme poverty of Central America was one of the key factors that supplanted economic stability and political freedom in the region. During the Cold War, left-wing insurgency guerrilla groups and right-wing military dictatorships both vied for control of countries in Central America, which in turn increased the importance of the region for the United States, Britain, and other countries. Near the end of the 20th century, Central American countries attempted to shift away from military regimes and move toward civilian-run democracies. However, by the first decade of the 21st century, Central America continued to endure the economic and political difficulties that accompany the transition from military dictatorships to viable democratic governments. This entry examines the history of Central American countries, with a focus on the relationship between guerrilla forces and government/military forces.

Background

The Central American isthmus has historically included all the territory between the northern border of Colombia and the southern border of Mexico—an area of roughly 200,000 square miles. Central America encompasses the five modern countries of Guatemala, El Salvador, Honduras, Nicaragua, and Costa Rica, and holds a population of roughly 40 million people. Other countries or regions share, or border on, the geographic area of Central America but have only occasionally been considered part of the Central American region, such as Belize (which was a colony of Britain until

Map of Central America.

Source: Central Intelligence Agency, Washington, D.C., 1990.

1981), Chiapas (a Mexican state on the Guatemalan border), and Panama (which was part of Colombia until 1903 when it declared its independence from Colombia with U.S. assistance).

The first historical records related to Central America originated in the 1500s when the isthmus was governed by the Spanish monarchy via the viceroy of Mexico. During these colonial years (1535–1821), Central America was frequently referred to as the Kingdom of Guatemala and encompassed the entire isthmus from Chiapas to the border between Costa Rica and Panama. In 1821, Mexico declared its independence from Spain, and in 1822, Central America gained *de facto* independence from Spain as well when the newly formed Mexican nation annexed all of the Central American territory to the

Costa Rica–Panama border. Nevertheless, Central America did not remain under Mexico's political control for long. In 1823, it seceded from Mexico and proclaimed itself a free nation named the United Provinces of Central America (UPCA). The UPCA was composed of the five principal Central American nations and did not include Panama. However, the UPCA did not maintain political unity for much more than a decade because fears of Guatemala's hegemonic intentions caused the other smaller states to remain belligerent and isolated from federalized control. In 1838, in the midst of both civil and inter-regional wars, Nicaragua seceded from the UPCA, followed by Honduras and Costa Rica. When El Salvador declared its independence as well in 1841, the UPCA ceased to exist.

Over the next century, from the 1840s to the end of World War II in 1945, Central America floundered economically and politically. The countries of the region were too small to become very economically stable, and thus they became increasingly reliant on larger powers such as Britain and the United States for economic aid and support. In addition to economic problems, the region lagged behind other nations politically; while other countries in Latin America attempted democratic governmental reforms, Central America continued to struggle under dictatorial regimes and extreme poverty.

Modern Central America Since World War II

The Cold War between the United States and the Soviet Union (1945–1991) caused tensions in Central America regarding the proliferation of communism in the Western Hemisphere. Following the Cuban Revolution and Fidel Castro's rise to power in 1959, some American policymakers believed that their obligation to quash the spread of communism was even more critical. Following the collapse of the Soviet Union in 1991, Central America made some modest progress related to democratic freedoms, economic progress, and fewer incidents of ethnic repression and human rights violations. But these changes were hesitant, and during the first decade of the 21st century, the region continued to combat extreme poverty, immigration, and endemic violence.

To 1989

Nicaragua and El Salvador both struggled with warfare, corruption, and violence throughout the 20th century. The Somoza family ruled Nicaragua in a dynastic fashion from 1936 to 1979, and because of the Somozas' willingness to work with U.S. interests in the region, many American presidents supported the Somoza family despite its record of human rights violations and corruption. Because of violence, vice, and the vast wealth disparity in Nicaragua, left-wing organizations increasingly appealed to the poor, who lived under the worst conditions in the country. One such group, the Frente Sandinista de Liberación Nacional (FSLN; Sandinista National Liberation Front) was organized in 1961 and took its name from Augusto César Sandino, the Nicaraguan revolutionary who opposed the presence of U.S. troops in Nicaragua in the 1920s and 1930s. Sandino was assassinated in 1934, but his name became a rallying

point for the rural, poor, and left-wing groups who demanded better conditions and less governmental dishonesty.

Following the 1978 assassination of Pedro Joaquín Chamorro, a popular Nicaraguan newspaper editor and proponent of the insurgency movement, the FSLN rallied and toppled the Somoza family from power in 1979. However, the left-wing nature of the FSLN (and its influence on Nicaraguan political figures such as Daniel Ortega, who became president of Nicaragua in 1984) made policymakers in the Reagan administration nervous, so much so that, in 1985, the United States ratified a trade embargo against Nicaragua and funneled weapons and money to the Contras, the primary opposition force against the FSLN government. However, when the Iran-Contra scandal (arms sold to Iran despite an embargo) came to light in 1986, the U.S. government was no longer able or willing to send more aid to the Contras.

El Salvador, the smallest of the Central American countries, also had a multitude of systemic problems throughout the 20th century ranging from overpopulation and violence to economic immaturity and racial intolerance. In the 1930s, the Salvadoran military government seized land holdings belonging to indigenous populations to increase coffee production. When the Indian communities disputed the government's actions, the military slaughtered thousands of Indian peasants in campaigns that included the 1932 La Matanza massacre that involved the deaths of more than 30,000 people from El Salvador's indigenous and poor communities. These atrocities unavoidably led to more violence and instability throughout the mid-20th century, which eventually culminated in the massive 12-year Civil War (1980–1992) that devastated El Salvador, resulting in the deaths of more than 70,000 people. As was the case in Nicaragua, Salvadoran violence was waged between insurgency groups and government/military forces. The predominant guerrilla force in El Salvador during the war, the Frente Farabundo Martí para la Liberación Nacional (FMLN; Farabundo Martí National Liberation Front) took its name from a Salvadoran peasant leader named Farabundo Martí, who fought against government repression in the 1930s. Like Sandino in Nicaragua, Martí was also a martyr for the cause of the peasants and indigenous populations, and like Sandino, Martí's name was co-opted by the guerrilla

insurgency. In the early 1980s, 18 Catholic priests were murdered by the military for their support of the insurgency. One of these priests was Archbishop Oscar Romero whose story was soon told throughout Latin America. In 1985, the government of El Salvador returned to civilian control, but the government's tacit relationship with the military was still easily recognizable.

By 1987, the violence in both Nicaragua and El Salvador was mitigated by the Central American Peace Accord (also known as the Esquipulas II agreements), which eventually helped end much of the violence in Central America and promised the possibility of greater economic and political stability in the isthmus. The Peace Accord was brokered by the Costa Rican president Oscar Arias, who earned Central American support for the initiative. And even though the Peace Accord had fewer immediate effects in El Salvador than in Nicaragua, by the end of the 1980s, the endemic violence spread by the FMLN and the Salvadoran military began to decrease. The Peace Accord represented an important event in Central American history because it demonstrated Central America's ability to deal with its own problems without outside interference from the United States and other international organizations.

However, the Central American Peace Accord had less influence in Guatemala and Honduras. One of the most significant differences between Guatemala and other Central American countries is the fact that it has the largest indigenous population in the entire region. More than 40% of the population of Guatemala are indigenous Maya who speak a variety of different Mayan dialects. This lack of demographic homogeneity led Guatemalan policymakers to enact vagrancy laws, debt peonage, and indigenous integration efforts to a higher degree than in other Central American countries.

In terms of political development, Guatemala attempted the transition from military dictatorship to civilian government earlier than other countries in the region; in 1944, a university professor named Juan José Arévalo was elected president of Guatemala, ushering in the first wave of political freedom and democratic reform in Guatemala's history. In 1950, Jacobo Arbenz, a colonel in the Guatemalan military, succeeded Arévalo as Guatemalan president. Arbenz was not a typical military politician; he displayed open ties to the Guatemalan Communist Party, which alarmed

both the U.S. government and Guatemala's largest economic producer, the New Orleans-based banana exporter named United Fruit Company. In 1953, Arbenz issued Decree 900, which nationalized less than 250,000 square acres of fallow United Fruit Company land and redistributed it to nearly 100,000 Guatemalan peasants. This event prompted the subsequent Central Intelligence Agency coup d'état in 1954, which ousted Arbenz from power and replaced him with Colonel Carlos Castillo Armas, who ruled as a military dictator and ushered in a new era of repression and violence. Within a few years, the brutal Guatemalan Civil War erupted (1960–1996); it is the longest civil war in the history of the Western Hemisphere.

In the early 1980s, many of the Guatemalan insurgents identified with or joined an umbrella organization called the Guatemalan National Revolutionary Unity (URNG). As a guerrilla movement, the URNG attempted to break the resolve of the Guatemalan military regime by resorting to terrorism and brutal violence. By the end of the Guatemalan Civil War, more than 200,000 people had died, the large majority of whom were indigenous Maya.

Throughout the 20th century, Honduras remained somewhat unique from the other countries in Central America. Like Nicaragua and El Salvador, Honduras dealt with incredibly high poverty rates. But like Costa Rica, Honduras endured less violence and revolutionary activity than the other Central American countries. Military dictators controlled the Honduran government almost continually between the 1950s and the 1980s; these military leaders were sympathetic to the desires of the United States and provided some aid to U.S. forces that fought against left-wing insurgency groups elsewhere on the isthmus. In 1982, the civilian Roberto Suazo was elected Honduran president, and he began to rule Honduras with the cooperation of the military and the United States. But Honduran civilian government was still tenuous.

Since 1989

During the 1990s and into the 21st century, Nicaragua, El Salvador, and Guatemala all combated corruption and violence in their governments. But progress remained sluggish. Between 1990 and 1997, Violeta Chamorro—the widow of the journalist whose 1978 murder sparked the FLSN rise

to power—governed as president of Nicaragua. Chamorro privatized industries, lowered government expenses, and hesitantly presided over the military's transfer to civilian control. In due course, her policies broke down the military's partisan ties to government and initiated its transformation toward a professional military organization. In 2006, the former Nicaraguan president and FSLN leader Daniel Ortega ran for and won the presidency of Nicaragua for a second term. After he took office in 2007, his relationships with Fidel Castro's Cuba and Hugo Chávez's Venezuela made some U.S. policymakers hesitant. Between 2008 and 2010, Ortega reached out to the governments of Russia, China, and Iran in ostensible attempts at diplomacy, solidarity, and mutual cooperation.

After 1990, things improved modestly in El Salvador as well. The civil war ended in 1992 when government and guerrilla forces contracted a peace agreement that ended the hostilities and violence. In 1994, the country held the first democratic election in Salvadoran history. The FMLN transformed from a guerrilla movement into a legitimate political party and ran candidates in every presidential election since 1994. In 2008, the FMLN candidate Mauricio Funes won the presidential election and became the first FMLN president of El Salvador. And while this peaceful, systematic transfer of power demonstrated the development of greater political maturity in El Salvador, the country still struggled with human rights violations, economic growth, and prevalent violence.

But the most important change near the turn of the century was the end of the Guatemalan Civil War. During the early 1990s, the war appeared to be declining. But the end of the war was postponed by the presidency of Jorge Serrano, who became Guatemala's 29th president in 1991. In 1992, the Serrano government was embarrassed by the Guatemalan indigenous activist Rigoberta Menchú, who was awarded the Nobel Peace Prize for her graphic testimonial regarding the violence of the civil war, which brought global attention to Guatemala. Under increasing international pressure, Serrano quickly grew frustrated at his inability to control the military, the guerrillas, the government, and ultimately to end the civil war. In May 1993, Serrano dissolved the Guatemalan Congress and Supreme Court, suspended the constitution, and attempted to initiate a dictatorship. However, within

a week of his attempt to seize dictatorial power, Serrano resigned and fled to Panama in the wake of a unified front against him comprising the military, the Supreme Court, and the government and also intense international pressure.

In 1996, Alvaro Arzú became the president of Guatemala and fulfilled his campaign promise to end the four-decade-long civil war. After a series of concentrated negotiations, the Guatemalan government and the URNG signed a cease-fire in the spring of 1996, followed by governmental recognition of the URNG as a legal Guatemalan political party. However, following the end of the war, Guatemala continued to flounder economically and politically. In 2007, Rigoberta Menchú ran for president of Guatemala but was unable to gain sufficient support.

Throughout much of the Central American violence and confusion at the turn of the century, Costa Rica remained somewhat independent from the other nations on the isthmus. It enjoyed more economic growth than any other Central American nation, and this growth was mostly attributed to cash crop exports, foreign manufactures, and vibrant tourism. While serving his second presidential term, Oscar Arias continued to fight for Central American peace. In October 2007, Costa Rica agreed to participate in the Dominican Republic–Central American Free Trade Agreement, becoming the final Central American country to join the trade organization. This agreement went into effect on January 1, 2009, and was anticipated to significantly increase trade revenues in Central America.

While Nicaragua, El Salvador, and Guatemala were attempting to end violence within their borders, Honduras initially appeared, like Costa Rica, to be more democratic and less violent. On January 27, 2006, Manuel Zelaya took office as the president of Honduras. But his attempts at positive economic reform were quickly negated by the global recession that struck during the first decade of the 21st century. Financial instability led to tensions between the government, the military, and the population, and Zelaya's control continued to unravel as accusations of censorship, corruption, and nepotism continued.

In an attempt to regain control, in March 2009, Zelaya set in motion a referendum designed to modify or rewrite the Honduran Constitution. However, the Honduran Congress and Supreme Court both contended that Zelaya's executive order for a referendum was unconstitutional and illegal. When

the Honduran military refused to carry out Zelaya's order to organize the referendum, Zelaya discharged the head of the Honduran military, prompting a wave of further resignations by high-ranking military officials. On June 27, 2009, the Honduran Congress began impeachment proceedings against Zelaya, but the next day, on June 28, Zelaya was taken from his residence at gunpoint by the Honduran military and expatriated to Costa Rica. He remained in Costa Rica for nearly 3 months before secretly returning to Honduras and claiming asylum in the Brazilian embassy in Tegucigalpa. Presidential elections were soon held, and Porfirio López was elected president of Honduras, although many countries and international organizations refused to recognize the López government. On January 27, 2010, Zelaya went into exile in the Dominican Republic, while on the same day, Porfirio López was sworn in as the Honduran president. Honduras's democratic rupture indicated to many that while things appeared to be improving in Honduras and Central America, in fact Central American democratic progress and economic stability remained uncertain and fragile.

CENTRAL ASIA

The Central Asian states of Kazakhstan, Uzbekistan, Kyrgyzstan, Tajikistan, and Turkmenistan faced both crisis and opportunity in their paths to independence. The Russian Empire, succeeded by the Union of Soviet Socialist Republics (USSR) dominated Central

Asia from the 19th to the late 20th century. In 1989, the Soviet Union cut military funding and completed the withdrawal of troops from Afghanistan. That same year, tensions released by policies of openness and restructuring, especially in Europe, combined with nationalist aspirations and economic strain, continued to undermine the viability of the USSR as a whole. The Soviets confronted widespread demonstrations and strikes and dealt with ethnic violence in Central Asia. In 1991, Central Asian leaders reluctantly declared independence. Subsequently, major world powers such as Russia, China, and the United States and its allies in the North Atlantic Treaty Organization (NATO) redefined their ties with the region. In response to these dynamics, Central Asian states have joined several international structures and established new bilateral and multilateral understandings. Several elements—proximity to Afghanistan, separatist movements, Islamic groups, the lasting impact of the Soviet military, economic potential, and the presence of oil, natural gas, and other resources—contribute to the global relevance of this multiethnic region. In the midst of potent social, geographic, and religious forces and faced with the enduring Soviet legacy, the transition to independence has presented each of these states with its own political, military, and economic challenges.

The independent course adopted by each republic, shaped not only by inherited conditions and resources but also by policy decisions, has produced unique developments in individual states. In brief, Kazakhstan controls massive oil reserves, enjoyed rapid economic growth in the mid-2000s, and has sought closer ties to the West than neighboring states. Uzbekistan inherited more military assets than some of its neighbors and has experienced periods of tension alternatively with the United States and Russia. With its political reform plans, Kyrgyzstan showed early promise for the development of democratic civil society, but economic crises and the expansion of presidential authority stifled its potential. Tajikistan has endured civil war, and many of its people live in poverty. A “president for life” ruled Turkmenistan for many years. The country holds large natural gas deposits and leans toward international neutrality.

Despite these differences, an examination of the recent history of Central Asia yields regional trends. The relationships among the Central Asian states and other world powers have also influenced

the region. This entry investigates events at state, regional, and global levels to provide perspective on the importance of society and geography, religion, politics, military, economics, and future prospects for Central Asia.

Society and Geography

Kazakhstan, Uzbekistan, Kyrgyzstan, Tajikistan, and Turkmenistan share a common history as Soviet republics in Asia. Russian, Persian, and Arab influences have shaped the region. Although each state bears the name of its largest ethnic group, they all include a mix of other populations, such as Russian or Uighur. All countries enjoy high literacy rates. Uzbekistan holds the largest population, but Kazakhstan covers the most area. Overall, the region spans slightly more than one third as much territory as the United States. The terrain includes steppe and desert. Major features include the Fergana Valley and several mountain ranges, including the Pamir, Tien Shan, Alay, and Altai. Areas in Tajikistan, Uzbekistan, and Kazakhstan experience earthquakes. Although landlocked, the region includes the Caspian Sea and the remnants of the Aral Sea. Rising soil salinity and water rights pose challenges for the region. Central Asian states share borders with each as well as China, Afghanistan, Iran, and Russia.

Religion

While a minority of Slavic descent adhere to Orthodox Christianity, those of most Central Asia follow Islam. A small community of Ismaili Muslims spans Tajikistan, China, Pakistan, and Afghanistan. Similar to Turkey and Pakistan, however, the majority of Muslims in Central Asia are Sunni. Turkey shares religious and, with the exception of Tajikistan, ethnic ties with Central Asia. Turkey moved quickly to exert influence after Central Asian independence by providing aid, signing treaties, and establishing trade agreements. Pakistan, which shares an Islamic heritage with Central Asia, has not risen to dominance in the area. In keeping with Soviet tradition, the Central Asian states remained secular republics, despite the cultural importance of religion in the region.

In a political context, many Muslims identify with moderate beliefs, though several groups have called for dramatic political change. The main program of Hizb ut-Tahrir officially concentrates

on the peaceful establishment of a state governed by Islamic law. Organizations like the Islamic Movement of Uzbekistan (IMU), however, established links with al Qaeda. The IMU drew support from contacts in Pakistan and other nearby countries. Juma Namangani, a Soviet veteran from the War in Afghanistan, helped found the IMU, which has advocated violence to achieve Islamic rule.

Politics

Sudden independence forced Central Asian states to develop new constitutional frameworks with little preparation. Each republic grants universal suffrage, and the popular vote determines at least some of the representation in one of the chambers of parliament. Generally, presidents exercise considerable authority in judiciary appointments. All constitutions ostensibly support democracy and popular sovereignty. In reality, presidents have displayed authoritarian tendencies. The role of the chiefs of state underscores the limitations of democratic reform so far.

Under the USSR, the Communist Party exercised authority over the Central Asian republics. Communist officials, either republic first party secretaries or other prominent members, became chiefs of state in the new countries. Transition of executive authority has proven problematic. Civil war erupted in Tajikistan from 1992 to 1997, though President Emomali Rahmon has retained power since 1994. Demonstrations ousted multiple heads of state in Kyrgyzstan in the 2000s. Specifically, protests against perceived election fraud and corruption culminated in the March 2005 Tulip Revolution. President Askar Akayev, who had ruled since 1990, fled the capital. Kurmanbek Bakiyev replaced Akayev. Roza Otunbaeva succeeded Bakiyev following more riots in 2010. In 2011, Almazbek Atambaev won election to the presidency. Presidents Nursultan A. Nazarbayev of Kazakhstan and Islam Karimov of Uzbekistan rose to power before independence and continue to rule 20 years later. They have extended their tenure in part by suppressing opposition leaders. Saparmurat Niyazov, formerly chairman of the Turkmenistan Supreme Soviet's Presidium, became president after independence. In 1999, he acquired the status of president for life. After his death in 2006, the deputy chairman of the People's Council, Gurbanguly Berdimukhammedov, became president and head of the government.

Political developments in the republics have elicited different responses from major world powers, including Russia, the United States, and China. Central Asian states quickly joined the Russian-led Commonwealth of Independent States on its formation in December 1991. From its inception, the Commonwealth of Independent States demonstrated limited effectiveness in coordinating political, economic, and military matters. Some members therefore formed other security partnerships. The United States also established new links with the independent republics. It has provided financial assistance to and sought military cooperation with Central Asia but has expressed objections over human rights abuses and the lack of progress in political reform, especially in Uzbekistan. China opened dialogue with the Central Asian states shortly after they declared independence. Its agenda includes stability in the Xinjiang Autonomous Region, an area that remains part of China but whose ethnic Turkic population, called Uighurs, has separatist tendencies. By working with its neighbors, who also have Uighur populations, China hopes to prevent the Uighurs from forming their own unified, ethnic state. China has also sought to promote cooperation and gain influence in other ways through its regional structures. In 1996, China, Russia, Kazakhstan, Kyrgyzstan, and Tajikistan established the Shanghai Five. Members addressed concerns over not only border disputes but also the presence of Islamist movements in Afghanistan and Central Asia. With the addition of Uzbekistan in 2001, the group reformed as the Shanghai Cooperation Organization (SCO). The SCO has played a role politically and is fostering military cooperation but exerts most of its influence through economic dealings.

The Military

The Soviet war in Afghanistan lasted from 1979 to 1988. The USSR conscripted soldiers, including men from Central Asia, to support the war effort against mujahideen resistance forces. As casualties mounted from the protracted conflict, popular support waned. The continuing cost of the war burdened the Soviet Union. Soviets finally began their withdrawal in 1988, completing the process in 1989. Many scholars point to the war as a contributing factor to the collapse of the Soviet Union.

The Soviet legacy continues to mold civil-military relations. Some of these consequences have been highlighted in the scholarship of Erica Marat. Tens of thousands of Central Asian soldiers have joined the Afghan Veteran Union since the 1980s. Members of the Afghan Veteran Union provide financial assistance for veterans in need (veterans lost support when the USSR collapsed), promote national patriotism, and, as a component of civil society, continue to affect politics and education. Furthermore, Central Asian republics inherited a tradition of subordination of the military to political authority. Even so, defense ministers generally have come from military, rather than civil, sectors. Authoritarian tactics of the republic presidents have also undermined civil-military dialogue.

The end of the Soviet Union also left an impact on Central Asia in other ways. Prior to 1991, a central command in Moscow coordinated military resources. After the fall of the Soviet Union, states struggled to form independent, national militaries. They faced this challenge concurrently with economic disruption caused by the USSR's disintegration. Armed forces in the region have worked to raise nonconscripted, professional armies and to update administrative frameworks. Equipping militaries with modern equipment and redesigning units for the realities of combat in the post-September 11 environment are goals that have proven especially difficult. This stems in part from budgetary limitations.

Although no longer part of the Soviet Union, Russia continued to exert influence over military policy in the region. Following the Soviet collapse, the military equipment and personnel that Russia did not recall to its own territory remained unevenly distributed throughout the region. Kazakhstan and Uzbekistan inherited more significant assets than their counterparts. For example, stockpiles of tactical and strategic nuclear weapons, relinquished by 1995, fell under Kazakhstan's jurisdiction. With high inflation and declines in economic output, the republics faced budgetary restrictions in their efforts to reform the military. Early conflicts illustrated military weaknesses, most notably in Kyrgyzstan during a 1999 clash in Batken. Kyrgyzstani and Uzbekistani armed forces demonstrated limited ability to combat insurgents from the IMU. After inflicting significant casualties, IMU forces fled and evaded capture. As noted by Roger McDermott, lack of proper

equipment, intelligence, and training complicated efforts of the armed forces.

In the early 2000s, the remaining partners of the 1992 Collective Security Treaty (CST)—Russia, Belarus, Armenia, Kazakhstan, Kyrgyzstan, and Tajikistan—began reorganizing into a new military alliance, the Collective Security Treaty Organization (CSTO). Uzbekistan later made efforts to join. Although established as a multilateral organization in that it promoted agreements and cooperation among multiple countries, the CSTO has especially served as a vehicle for Russia to promote bilateral arrangements between individual members and itself. Similar to NATO, the CSTO declared that members would consider aggression against one as an act against all. The CSTO has made efforts to form a collective peacekeeping force and conducts joint military exercises. In response to groups like the Islamist group Hizb ut-Tahrir, the IMU, and others, the CSTO has promoted antiterrorism efforts. The CSTO expanded influence over economic matters by merging with the Commonwealth of Independent States' Eurasian Economic Community (EurAsEC). The CSTO has a rotating presidency among member states, though Russia provides the bulk of the funding. Russia extends its influence in the region through the CSTO, but China also helps shape Central Asian policies through its leadership in the SCO.

Although the organization emphasizes economic cooperation, the SCO promotes antiterrorism efforts. It established an antiterrorism center in Tashkent, Uzbekistan, and has formed the Regional Anti-Terrorist Structure (RATS). It also conducts annual military exercises. Generally, these are not conducted with the CSTO. The SCO meets annually and the chairmanship rotates. Most of the funding for the SCO comes from China and Russia.

Central Asian states have also cooperated with the West. Kazakhstan, in particular, has pursued a foreign policy divided among Russia, China, and the West. All the five republics, with Tajikistan being the last to agree in 2002, joined NATO's Partnership for Peace. The United States and its allies encouraged the republics to participate in the peacekeeping Central Asian Battalion (CentrAsBat). Like the CSTO and the SCO, NATO has promoted antiterrorism efforts.

After September 11, 2001, all Central Asian states cooperated in some fashion with the

United States and its allies. The United States and other coalition members maintained stations in Tajikistan and at Manas National Airport in Kyrgyzstan. Kazakhstan offered use of its airfields. Turkmenistan agreed to support humanitarian missions. Uzbekistan offered the use of the Karshi-Khanabad airport, also known as "K2."

Relations between the United States and Uzbekistan soured following the events of May 2005, which are frequently referred to as the "Andijan Massacre." The government deployed armed forces during a protest in the city of Andijan, Uzbekistan. Soldiers clashed with civilians, resulting in many deaths. Uzbekistan insisted that they fired on bandits and terrorists. The United States condemned the event and called for a full investigation but met with resistance from the SCO. As tensions rose between the countries, Uzbekistan asked the United States to leave K2 in 2005, and American forces withdrew later that year.

During the conflict in Afghanistan, the United States and the Central Asian states demonstrated some ability to cooperate militarily. Kazakhstan later provided additional support for actions in Iraq. The country formed a peacekeeping battalion known as KazBat. Hostilities in Afghanistan, however, also generated negative consequences for the region. Following military action in Afghanistan, drug trafficking increased in Central Asia, especially in Tajikistan.

Economics

Central Asia holds rich deposits of natural resources. It possesses significant reserves of oil, natural gas, gold, mercury, rare earth metals, and uranium, among other assets, though these are distributed unevenly among the republics. The region ranks among the world's top producers of cotton.

Soviet policy encouraged republics to develop specialized economies. Key products included grain and oil from Kazakhstan and cotton from Uzbekistan and Tajikistan. A long history of intensive cotton production and other farming practices have strained the water resources in the region. Despite efforts to coordinate water usage, discussions about water rights remain especially contentious. Central Asian states have faced other challenges. After the disintegration of the USSR, countries initially sought to establish the Russian ruble as a common regional

currency but rejected this project in favor of national currencies. All countries experienced high inflation and a significant contraction in gross domestic product. Recovery began only around the turn of the century. Kazakhstan enjoyed additional prosperity in the mid-2000s. Economic crisis in the 2000s further worsened the situation in Kyrgyzstan.

Although the republics are no longer as closely integrated with Russian economic policy as during the Soviet period, Russia remains an important trading partner. Additionally, Russia has financial arrangements with individual states. For example, Russia continues to lease the Baykonur Cosmodrome, once important to the Soviet space program, from Kazakhstan.

Other powers have gained a foothold in the region. The United States has established some trade relations. Like Afghanistan, the United States imports goods from Turkmenistan. The U.S. and Western institutions such as the International Monetary Fund have also provided economic assistance and encouraged market reforms and privatization.

China, in particular, has also sought economic relations with Central Asia and access to energy. It has promoted these goals through the SCO. China has become an important trading partner with the region. China has grown to be a major importer from each state, and a major exporter to Uzbekistan, Tajikistan, Kazakhstan, and Kyrgyzstan. China has invested heavily in Kazakhstan. In the 1990s, it established air and rail connections between the capitals of Kazakhstan and Xinjiang Province.

Summary and Future Prospects

Kazakhstan, Uzbekistan, Kyrgyzstan, Tajikistan, and Turkmenistan share a legacy of Soviet influence, but regional cohesion remains weak. Post-Soviet elites have mobilized nationalist rhetoric in their state-building projects, and ethnic identities that defy national boundaries—ethnic riots emerged even before the end of the USSR—remain a potential force of conflict and change in the region.

In the wake of the Soviet Union's collapse, the countries faced stiff challenges building new political, military, and economic structures. High inflation and decline in gross domestic product complicated these efforts. The region also has endured civil war, riots, and movements calling for the establishment of Islamic states. In general, protracted and difficult

transition marked the path of independent statehood in Central Asia.

Although states have remained secular, political, military, and economic reforms in the region, with the possible exception of Kazakhstan, have achieved limited success. Presidential authoritarianism remains common. In particular, Western hopes for the rise of Kyrgyzstan as a model of liberal democracy faded as economic crises, corruption, and expanding presidential power tainted the country's policies.

Russia continues to exert influence in the region and has shown unease with the presence of American military forces within neighboring states. In recent years, powers such as China have increased in prominence. The CSTO, the SCO, and NATO have all conducted exercises with military forces in the region and have expressed goals of combating terrorism.

Despite continued challenges in the region, including debt and corruption, numerous opportunities exist for cooperation among Central Asian states and other powers. Though the United States and China may vie for influence over the region's vast natural resources and energy reserves, mutual interest in combating drug trafficking and Islamist insurgency represent common goals. Central Asia will remain globally significant in the years ahead.

CENTRAL INTELLIGENCE AGENCY

The Central Intelligence Agency (CIA) is an independent U.S. government agency responsible for providing national security intelligence to policymakers and the president. The CIA has provided intelligence since its inception in 1947 and undertakes international covert operations. Because the CIA is restricted from acting domestically, it has an inherent international intelligence focus and is one of the most recognized intelligence agencies in the world. This entry describes the background and creation of the CIA as well as providing an outline of operations in which the agency has been involved. The entry also looks at the CIA's current strategic operations.

Background and Creation of CIA

In 1947, President Harry S. Truman announced the creation of the CIA under the National Security Act, which legally enabled the agency to collect and analyze intelligence. The importance of intelligence gathering was illustrated during and immediately after World War II, and the creation of the CIA ensured that such capabilities could continue in a postwar landscape. Previously, intelligence gathering and reporting fell to the National Intelligence Authority and the Central Intelligence Group. The passing of the National Security Act was strategic in that besides effectively reorganizing, increasing, and strengthening the intelligence capabilities of the United States, it also created the post of director of central intelligence, whose position became principal adviser to replace the National Intelligence Authority and Central Intelligence Group and signaled a new era of intelligence capability.

Because the CIA's function was to gather intelligence integral to the safeguarding of the nation, it was created, after much congressional scrutiny, as an independent agency under the auspices of the National Security Council (NSC). This meant that the CIA would provide the NSC with the intelligence the latter group required to make assessments about policy and external relationship management. Congress sought strict assurances that the CIA would be restricted to only clandestine intelligence-gathering activities and intelligence analysis and that it would not be involved in any policy or lawmaking—the latter activities perceived to be the domain of the NSC. The CIA thus became an independent intelligence-gathering agency with a specified focus on the analysis of national security concerns and clandestine activities. Both Congress and the president have oversight of CIA activities.

Directorates or Services Within the CIA

Like most large organizations, the CIA is broken up into smaller directorates or offices that allow each section to specialize and also allow for some degree of autonomy in their activities. There are four directorates: National Clandestine Service, Directorate of Intelligence, Directorate of Science and Technology, and Directorate of Support.

The National Clandestine Service came into being in 2005 after previous incarnations as the Directorate of Plans (1951–1973) and most recently

as the Directorate of Operations (1973–2005). This directorate is responsible for the collection of human intelligence (HUMINT) and for planning and executing covert operations. The Directorate of Intelligence is responsible for intelligence dissemination related to U.S. policy concerns worldwide and publishes the *President's Daily Brief* and the *World Intelligence Review*. The directorate publishes highly classified material for the upper echelons of policy and security officials, including the president and the cabinet. The Directorate of Science and Technology is a highly technical directorate that often collaborates with the wider intelligence community on matters as diverse as science research to electronic surveillance. The Directorate of Support is responsible for the provision of key services that allow the aforementioned directorates to function, ranging from telecommunication to medical services.

Until 2001, the CIA also included the Directorate of Administration. The Directorate of Administration's essential functions are funneled into and through specific offices, including Human Resources, Public Affairs, the Office of General Counsel, Office of Equal Opportunity, Office of Congressional Affairs, Office of the Inspector General, and the Office of Military Affairs. Together these directorates and offices provide the framework and means for intelligence gathering, analysis, and dissemination.

The CIA typically employs the use of clandestine services to gather intelligence. This means that intelligence is gathered through the use of covert operations—usually human intelligence. That's not to say that the CIA doesn't use other forms of intelligence gathering. Imagery and signals intelligence (SIGINT) are also used; the CIA regularly incorporates foreign instrumentation signals intelligence (FISINT), communications intelligence (COMINT), and electronic intelligence (ELINT) into assessments. It is important to note that the majority of signals intelligence used by the CIA comes from partnership with the National Security Agency.

CIA Operations: Cold War

During the Cold War with the USSR, the CIA was able to test its intelligence-gathering skills with covert operations designed to destabilize the Soviet government and those countries within the Eastern

Bloc believed to be supporting the USSR. A special Soviet Operating Division existed within the CIA Office of Special Operations that devoted itself to covert intelligence-gathering activities on Russian soil. Intelligence was fed back to the United States and Western European agencies on Soviet movements and plans—especially threats to West German sovereignty. For example, the “Berlin Blockade,” instigated by Joseph Stalin from June 24, 1948, to May 12, 1949, saw the CIA releasing weekly intelligence summaries—a testament to the efficient use of clandestine services and its ability to covertly access sensitive information. The CIA also undertook counterintelligence activities in response to the activities of East Germany's *Ministerium für Staatssicherheit* (Stasi; secret police) and the Soviet Union's KGB (*Komitet gosudarstvennoy bezopasnosti*; secret police/national security agency) within the Eastern Bloc.

Cuba: Bay of Pigs Invasion 1961

The CIA also recruits and trains intelligence operatives where it may further and safeguard national security interests. The failed April 1961 “Bay of Pigs” invasion saw the CIA recruiting and training exiled Cubans in an attempt to overthrow the Cuban government. A major problem with the operation was that it was believed that Cuba had received counterintelligence from the KGB and others as to the attack and was ready with reinforcements. Many observers agree that CIA operatives and intelligence analysts should have been aware of the Cubans having such knowledge, and the resulting sociopolitical fallout was so extreme that President John F. Kennedy announced publicly the failures of the CIA with their intelligence analysis and questioned its ongoing usefulness to the government.

CIA Involvement in Southeast Asia

The CIA was heavily involved in intelligence-gathering activities in Southeast Asia, notably during the Vietnam War era. The period from 1950 to 1974 saw heavy CIA involvement in Vietnam, Laos, and Cambodia. American strategists relied heavily on covert intelligence in the fight against the North Vietnamese. U.S. attempts to counter the so-called domino effect of communism saw covert operations spread across the region in an attempt to stave off a Southeast Asian communist bloc.

The CIA provided training and finances to troops in Vietnam, Cambodia, and Laos. In what was commonly referred to as “The Secret War,” the CIA trained thousands of Hmong soldiers to fight the communist Vietnamese–partnered Pathet Lao who wanted to overthrow the Royal government, finally succeeding in 1975.

CIA Operations in Central and South America

The CIA also undertook many operations in South American countries during the Cold War. The CIA played a key role in overthrowing Guatemala’s Arbenz regime in the 1950s and engaged in an ongoing effort to overthrow Fidel Castro in Cuba. The CIA was actively involved in a propaganda campaign against the Brazilian President Joao Goulart from 1961 to 1964, and in 1961, the CIA was involved in a covert operation to assassinate Generalissimo Rafael Trujillo of the Dominican Republic. It is widely believed that the CIA was also involved in Bolivia in the coup that deposed Victor Paz Estenssoro, as well as in antisocialist campaigns in the country from 1964 to 1975.

Post–Cold War CIA Operations

In keeping with their intelligence-gathering capabilities abroad, the CIA was notable for its ability to provide timely intelligence during the Gulf War and Operation Desert Storm. The CIA provided expert intelligence and analysis on the Saddam Hussein regime—in fact, the organization had been active in Iraq from the early 1960s, providing analysis on terrorist activities, military technology, internal policies, and the sociopolitical situation. Sources suggest CIA involvement in planning coups, financing campaigns against Saddam, and funding internal intelligence agencies that could assist the CIA in its ongoing operations against the dictator.

CIA—and other intelligence organizations’—reports of Saddam Hussein’s ongoing efforts to produce weapons of mass destruction played a key role in justifying the U.S. invasion of Iraq in 2003 (though it became clear after the invasion that these weapons did not, in fact, exist). During the conflict, the CIA continued to play an important role, providing intelligence to U.S. and coalition forces and alerting the administration to human rights issues, such as the availability of drinking water, health care, and so on.

CIA involvement has been notable during the ongoing War on Terrorism, particularly with regard to activities such as extraordinary rendition, assassinations, and torture. Most recently, the CIA has come under scrutiny for its use of drones in relation to targeted killings of civilians in other countries. The CIA has increased its use of unmanned aerial vehicles in international sovereign airspace in an effort to assassinate individuals deemed a threat to U.S. security. The CIA’s use of unmanned aerial vehicles has resulted in significant controversy, and debate has ensued as to whether these actions conform to international law.

The CIA and 9/11

The September 11, 2001, attacks on American soil changed the psyche of the American people forever and shook their trust in the capabilities of government agencies’ ability to adequately protect them. These events raised serious questions regarding the CIA’s ability to provide and act on intelligence and therefore protect the United States. In response to the attacks, a special 9/11 Commission was set up in November 2002 to analyze the response to the attacks and also to provide an analysis of the intelligence communities’ role in the attacks—most notably, the capabilities of the CIA and the Federal Bureau of Investigation.

The commission’s report placed blame on both the CIA and the Federal Bureau of Investigation’s intelligence-gathering operations and use of intelligence and called for intelligence reform to ensure the safeguarding of the United States and its interests. The 2004 Intelligence Reform and Terrorism Prevention Act effectively reformed the CIA by creating the Office of the Director of National Intelligence. This office oversees the management and leadership of the intelligence community, whereas earlier the CIA was responsible solely for its own actions and had no mandate to coordinate with other intelligence-gathering agencies.

CIA Strategic Developments

A major strategic development for the CIA is the increased use of technology for intelligence capability—both collection and dissemination. In 2010, the CIA announced that investing in technological infrastructure was critical and, in line with the creation of U.S. Cyber Command (USCYBERCOM), would

allow for increased intelligence capability. U.S. Cyber Command represents the centralization of existing cyber-focused military service commands, like the army, navy, and air force. As a result, the CIA is increasingly moving toward merging human covert intelligence and signals intelligence, which allows for increased use of artificial and electronic intelligence.

There has also been more movement toward expanding intelligence capability in the Australasian/Oceania region. Specifically, CIA efforts have focused on utilizing Australia as a launching pad to intelligence activities in Southeast Asia and East Asia due to CIA's close relationship with the Australian Secret Intelligence Service (ASIS), Australian Secret Intelligence Organization (ASIO), and the Australian Federal Police (AFP). This push comes from a strategic partnership that has been in existence since the late 1960s, notably at Pine Gap, which is believed to be the largest CIA facility outside the United States.

CHAPLAINS

Chaplain have been a part of American military units since the colonial era. Chaplains were appointed to George Washington's Continental Army and, since the 1790s, have served with the U.S. Army and the U.S. Navy. Historically, their role has ensured that servicemen and servicewomen are able to follow the tenets of their faith while in uniform. Although there have been legal challenges asserting that the chaplaincy violates the First Amendment establishment clause, federal courts have rejected claims that providing military chaplains is unconstitutional. In the view of the courts, maintaining a chaplaincy allows those in the armed services the Constitutional right to freely exercise their religious beliefs.

Chaplain serve with the army, navy, and air force as commissioned officers. Chaplains assigned by the U.S. Navy serve the U.S. Marine Corps and the U.S. Coast Guard. Although chaplains are non-combatants by international law and custom, historically, they have often put themselves in harm's way to minister to servicemen and servicewomen. More than 400 chaplains have died while in the line of duty, and eight have earned the Medal of Honor.

Chaplain's principal responsibilities are to lead religious services and to serve the pastoral needs of those in the service, such as visiting the sick and the wounded. This role takes on added importance for troops engaged in combat, and one of the most somber duties for chaplains is to lead memorial and funeral services. Pastoral counseling, a role embraced by many chaplains, is viewed as beneficial in promoting good morale, especially for those in the enlisted ranks. Both stateside and on foreign bases, chaplains also care for the spiritual needs of the families of servicemen and servicewomen.

Chaplain have often played a crucial role in promoting humanitarian relief to civilians caught in war zones. In World War II, Jewish chaplains played a critical role in providing relief to Holocaust survivors. In Korea and in Vietnam, chaplains oversaw relief efforts aimed at orphans and displaced civilians. At the same time, chaplains have come under criticism for failure to challenge military policies that violate the ethical imperatives of their faith. During the Vietnam War, a soldier who had witnessed a massacre at the village of My Lai informed a chaplain serving with the Americal Division; the chaplain

subsequently failed to take effective action to ensure that the military chain of command properly investigated this reported incident.

History

Chaplains have always been volunteers, even when the United States relied on conscription during the two World Wars and early Cold War. Until the 20th century, chaplains in the army and navy received their appointment with few formal qualifications, and neither the army nor the navy had a chief of chaplains. Proportionally, the number of chaplains in the service was small until the 20th Century. For instance, the first federal Congress in 1791 authorized only one chaplain for the army. During the War of 1812, small numbers of regular chaplains assigned on the brigade level were supplemented with militia chaplains. Although each naval ship was authorized to have a chaplain, an 1842 law limited their number to 24, and this provision remained in effect through the Civil War even though the navy had more than 600 ships in service.

The Civil War witnessed a vast expansion of the chaplaincy to meet the influx of the huge citizen armies formed by the U.S. government and the Confederacy. Religion played an important role in sustaining soldiers on both sides. This conflict also witnessed the appointment of the first African American chaplains within the U.S. Army, as well as the first rabbis.

The late 19th and early 20th centuries witnessed a sustained effort to professionalize the chaplaincy and to ensure they had adequate religious training and experience. As part of this process, the army and navy mandated those seeking an appointment as chaplain receive an ecclesiastical endorsement from a recognized religious body. As a result of these efforts, chaplains are among the few members of the American military whose commissioning appointment depends on an official sanction from an organization outside the armed forces. Clergy seeking an appointment as chaplain must still receive the endorsement of a religious denomination and/or interdenominational organization, such as the National Association of Evangelicals or National Jewish Welfare Board. Clergy must possess a college education and should have attended a theological school even if their faith does not mandate it. For instance, Christian Scientists do not have an ordained clergy, but to accommodate the military, they send prospective chaplains to theological school

in order to qualify to meet the educational qualifications for the military chaplaincy.

Prior to World War I, chaplains received no formal training from either the army or the navy regarding their duties and responsibilities. During World War I, both services established training schools for chaplains that sought to educate chaplains on military regulations and laws, provide some rudimentary military training, and consider the unique religious environment chaplains would encounter. Training schools played a significant role in creating an ethos among chaplains, especially in the army, that stressed the need for chaplains to meet the needs of all servicemen/women irrespective of their faith. At the minimum, this entailed finding chaplains of other faiths to lead services for non-Christians and making special provisions for holidays (i.e., securing matzos for Jews during Passover). Currently, chaplains schools for the army, navy, and air force are all based at Fort Jackson, South Carolina.

The National Defense Act of 1920 created a Chief of Chaplains in both the army and the navy, and this contributed to further professionalization of the chaplaincy in both services. It ensured that chaplains in the field had a high-level advocate in the War and Navy Departments able to promote their interests. In World War II, the Chief of Chaplains was granted general officer rank in both the services. In 1948, the air force established its own chaplaincy, and a Chief of Chaplains was appointed.

World War II marked a watershed for the chaplaincy and religious life within the American military. President Franklin D. Roosevelt and senior military leaders promoted policies that ensure the free exercise of religion for American general infantries serving within the military. Congress appropriated funds to build hundreds of ecumenical chapels at military bases. The chaplaincy expanded dramatically, but strong efforts were made to have it reflect the religious affiliation of American GIs, requiring an unprecedented expansion of Roman Catholic priests and rabbis within the service.

Despite having more than 10,000 clergy in uniform, the army and the navy strained to meet the needs of more than 15 million men in service during World War II. To ensure that chaplains served as many GIs as possible, Protestant ministers were required to lead a nondenominational service for GIs, although they could hold a separate service following the rites of their own religion. At the behest of the military, the Jewish Welfare Board created a

common prayer book for worship by Conservative, Orthodox, and Reform Jews. Recognizing the limited number of chaplains, many clergy went to great lengths to accommodate soldiers' religious needs. To stay close to the front lines, many stationed themselves at medical aid stations to assist with the incoming wounded and to offer spiritual comfort.

During the Cold War, American leaders stressed religion as one of the essential differences between Communism and the American way of life. To bolster morale, chaplains were assigned the task of character education by the U.S. Army, seeking to encourage enlisted men in understanding the ideological nature of the conflict with the Soviet Union. The military continued the practice of mandating Protestant chaplains perform a general Protestant service and even created a uniform Sunday school curriculum for use at army bases. During this period, resistance started to emerge among evangelical chaplains over these interdenominational practices; they argued that the focus on interdenominational worship conflicted with their spiritual beliefs.

The Vietnam War led to a decline in the number of mainline Protestant ministers and rabbis serving in the military. In part, this reflected the impact of the antiwar movement on many Protestant denominations, as well as the Reform and Conservative movements of Judaism. Although Roman Catholics remained the largest single denomination represented in the armed forces, the number of Catholic priests declined, reflecting the demographic decline in the number of ordained Catholic priests.

Under the All-Volunteer Army, the chaplaincy has taken on a more evangelical character. In part, this reflected not only the retreat of mainline chaplains but also the rising number of evangelicals serving in the military. Despite this growing number of evangelicals, Roman Catholic adherents remained the largest single faith. In 1974, the chaplaincy became more diverse with the inclusion of women as chaplains, reflecting a wider trend as an increasing number of religious denominations began to ordain female clergy. The first Muslim chaplain was appointed in the 1990s, and the first Buddhist chaplain in the 2000s.

Multiple and Conflicting Roles

Several inherent tensions emerge from chaplains' dual role as clergy and military officer. Although

the armed forces insist that chaplains must first and foremost consider themselves clergy who adhere to the tenets of their faith, they are also commissioned officers subject to military law and discipline. In the organizational structure, chaplains generally serve as staff officers in a specific command, but they also report to the Chief of Chaplains. Since chaplains have always been volunteers, most who served have reconciled the violence inherent in war with the ethical principles of their faith. In the case of the Christian tradition, many chaplains embrace the just war doctrine that accepts the use of violence to deal with evil.

While making religious accommodations by providing chaplains, the military has also placed limits on the degree to which servicemen and servicewomen can practice their faith. For instance, with few exceptions, they are banned from wearing beards and are not permitted to wear religious head coverings while on duty. Often, servicemen and servicewomen are required to remain on duty even during religiously significant holidays. Access to clergy and religious services can be difficult, especially for those deployed overseas. Some chaplains are essentially itinerant so they hold religious services for their adherents, especially for those serving Jews, Muslims, and Buddhists. Many smaller naval vessels have no chaplain stationed on board, and religious services—if conducted—must be led by lay leaders. For some faiths, the absence of a chaplain means certain religious rituals cannot be performed; for instance, only an ordained priest can say Mass or grant absolution in the Roman Catholic Church.

In all the services, official policies and an informal ethos stress that chaplains should serve the religious needs of all servicemen and servicewomen. Chaplains have often worked diligently to ensure that men and women of different faiths are able to worship, especially on religiously significant holidays. Tension exists, especially for many evangelical Protestants, over the question of proselytizing and interfaith gatherings. While official policies do not explicitly ban evangelical outreach, there is a strong sentiment within the chaplains corps, especially in the army, that an individual chaplain should not seek to convert those of other faiths (i.e., not raid the flock of other chaplains). However, some evangelical Protestants have insisted that their religious faith makes proselytizing imperative, and they also argue they must publicly point out the errors

inherent in other faiths. Chaplains are frequently tasked with giving prayers at ceremonies and events that are inclusive of individuals of all faiths. Several Protestant chaplains have protested when commanders issued directives mandating that prayers avoid a sectarian cast and mention of Jesus Christ.

The military continues to emphasize chaplains' diverse roles: promoting the free exercise of religion, strengthening troop morale, serving as a counselor to servicemen and servicewomen in distress, and furthering individual morality and personal responsibility. In wartime, they have often led funeral services for units to memorialize those killed in battle.

The servicemen and servicewomen they serve are growing even more diverse. Protestants and Roman Catholics continue to make up the majority of those in armed service, but there are growing numbers of Buddhists, Muslims, and Hindus as well. Despite the adage "there are no atheists in foxholes," slightly more than 0.5% of American service members have declared themselves atheist or agnostic. In a 2009 survey regarding the religious beliefs of those in the armed services, 20% of all servicemen and servicewomen listed no religious affiliation. There have been calls by some atheists in uniform and among secular humanist groups for the appointment of atheist chaplains.

The U.S. Constitution mandates no religious test to hold political office and establishes no national religion. Instead of weakening religion, religion has thrived within the American society even with this lack of state support and sanction. The military chaplaincy has helped ensure that servicemen and servicewomen do not have to abandon their religious faith in order to serve their country.

CHINA, PEOPLE'S REPUBLIC OF

At more than 6 million square miles and with a border shared with 14 different countries, China ranks as the third largest geographic country in the world. Currently the world's most populous country, China contains 1.3 billion people. The Communist Party of China (CPC) runs the country from the capital of Beijing and oversees multiple provinces, as well as the two special administrative regions of Macau and Hong Kong. The Chinese economy is the world's second largest and is also the fastest growing. China's expansive size means that it contains many environments, from deserts to monsoon-flooded rice paddies. The Yangtze and Yellow rivers, the country's two major watercourses, flow to the ocean in the east from Tibet. China contains mountains, subtropical rainforests, plains, grasslands, and deserts—including the Gobi. The expansion of these deserts is proving a major environmental concern. Chinese culture traditionally places a strong emphasis on the family, placing responsibilities on the family and nation above the individual.

This entry describes the political structure of the People's Republic of China (PRC) as it exists today and then provides an overview of Chinese history and current affairs. It also provides an overview of China's current military system. China's emergence as a global economic power in the early 21st century is nothing short of remarkable given the nation's turbulent history in the 19th and 20th centuries. But in considering China's history, it is important to keep in mind that for many Chinese this is a return to power once enjoyed by the nation in an earlier era. In the 1400s, while Europe was only emerging from an era of political and economic fragmentation, China was a major global power. The rise of Europe and later Japan would contribute to China's decline and fragmentation, which would not be reversed until the formation of the PRC in 1949.

Chinese Government and Politics

The government for the PRC has three central bodies: (1) the People's Liberation Army (PLA),

(2) the State Council, and (3) the Chinese Communist Party (CCP). The Paramount Leader is the head of these three bodies and generally holds the following posts: General Secretary of the Central Committee of the CPC, President of the PRC, and Chairman of the Central Military Commission. The Paramount Leader is part of the Politburo Standing Committee of the CPC, a small committee that consists of the top leadership in China that controls the CCP. The Politburo Standing Committee, however, is only a section of the larger politburo, which manages state and regional issues. The State Council, chaired by the Premier, controls the administrative tasks for the PRC, and the PLA enforces order. Furthermore, most positions of power in the PLA and the State Council are held by party members, though not all.

As in most communist states, the Communist Party and the government are separate institutions. At the same time, the Communist Party holds a monopoly on political power and only allows a few token opposition parties to exist. Since the liberalizations of the 1970s, there have been greater opportunities for free expression and dissent, but China still restricts basic human rights when authorities perceive any threat to the supremacy of the Communist Party. The government is especially zealous in censoring the Internet and controlling the flow of any information deemed subversive.

The National Party Congress legally controls the Communist Party, but actual power is exerted by a small politburo and even smaller standing committee. It is this small group of party elders that picks the senior leadership of the country and makes key policy decisions. Since Mao Zedong's death, the politburo's size and influence has increased, diminishing the autonomy of the Party General Secretary and Chinese Premier. Officially, the National People's Congress elects China's President and Vice President for 5-year terms. Regional legislative bodies and the PLA elect members of the People's Congress who serve 5-year terms. But in reality, China's senior government leaders are selected by the politburo.

Both the party and government exert control over China's judicial system. Human rights activists have protested the lack of due process within the judicial system and the widespread use of capital punishment. In the economic arena, the rule of law is not uniform, and there have been widespread complaints regarding China's failure to protect the

intellectual property rights of American companies, especially those in high-technology fields.

China is organized into 23 provinces, five autonomous regions (e.g., Inner Mongolia and Tibet), four municipalities, and two special administrative regions—the former Portuguese colony of Macau and the former British Crown Colony of Hong Kong. Provincial and local governments have significant autonomy within the Chinese system; this has allowed a number of regional party officials to build significant political power bases.

Imperial China

The Xia Dynasty, China's first recorded dynasty, dates back at least to 2100 BCE. Though plagued by invasions from warlord states, the Xia managed to maintain control over its core territories. By the Qin Dynasty (221–206 BCE), China began to build the Great Wall, a project that the Ming dynasty (1368–1644) expanded. As early as the Han Dynasty (202 BCE to 220 CE), China maintained diplomatic missions, culminating with the hosting of Marco Polo around 1266. The Ming Dynasty, the last dynasty run by ethnic Han Chinese, expanded Chinese land holdings and military might. Ming Emperors supported the creation of a powerful fleet that undertook a series of voyages around the Indian Ocean basin to project Chinese power and establish commercial relations with societies as far away as East Africa. In 1433, however, the Ming Dynasty stopped the expeditions to focus on internal concerns. In 1644, the Ming Dynasty fell to the Jurchens, also known as Manchu (from Manchuria), who created the Qing Dynasty, the last Chinese dynasty.

Trade relations between the Qing and the West soured quickly. Western nations had grown accustomed to trade with China, and items like Chinese silk, porcelain, and tea had become staples in European society. The Portuguese reached the country first, seeking trade and bringing Christianity, and soon after, the Dutch and British joined the Portuguese in establishing their presence in China. While Chinese officials viewed outside nations as subordinate and trade as unnecessary, the government allowed trade in limited amounts, focused on a select few cities like Macau and Canton. Furthermore, all foreign trade had to be handled by the Cohong, a Chinese merchant guild. Then, in 1760 with the creation of the Canton System, which

restricted foreign trade with China even further, the British East India Company pressed the Chinese government for more open ports for trade and a fixed tariff. To add to the tensions foreign powers had with China, traders struggled to sell foreign goods to the Chinese, forcing the exchange of gold and silver bullion for Chinese goods. When the British East India Company proved unable to gain a foothold in China, the British turned to the illicit import of opium.

Britain began to import opium in mass quantities into China following their establishment of control over opium production in India. China experienced an epidemic of opium addiction, and when China decided to enforce their anti-opium laws, the British responded with ultimatums and violence, sparking the First Opium War (1839–1842). The victorious British enforced the Treaty of Nanking, imposing a fixed tariff on trade, ceding Hong Kong to the British, and abolishing the Cohong. The Treaty of the Bogue supplemented the Treaty of Nanking, enforcing extraterritoriality for British subjects and giving Britain a “most favored nation” status. Afterward, France, the United States, and a series of other countries demanded similar treaties and were able to secure extraterritoriality in a series of unequal treaties. Subsequent disagreements led to another Opium War, and these issues, combined with internal discord, forced the Chinese to begin efforts to modernize the country.

China's attempts to modernize began with Conservative Confucian Reform or “Self-Strengthening.” China needed a complete modernization of the countries' administration, education, military, and more, but Conservative Confucian Reform did not provide for any drastic changes. At the same time, Japan sought to gain mainland colonies, specifically Korea. This Japanese push for expansion led to the First Sino-Japanese War. The war ended with the Treaty of Shimonoseki, with Japan as the victor; the loss humiliated China. Concessions in the Treaty of Shimonoseki forced China to open more ports for trade and gave Japan rights over Korea and control over several islands, including Taiwan.

China attempted several more reforms and modernizations in the years following the conflict, but none provided the complete modernization that China needed. Furthermore, China suffered from internal problems while continuing to blame

foreigners for the countries' difficulties. This sentiment resulted in the Boxer Rebellion, a bloody insurrection that sought to drive out all Westerners from China and laid siege to foreign legations in Beijing (1900). Once the United States and other foreign powers intervened to crush this rebellion, China faced even further restrictions and an indemnity.

Emergence of Modern China

By 1905, the Empress of China decided to undertake more drastic reforms, including the creation of a constitutional monarchy. However, the revolutionary group *Tongmenghui* opposed royal rule, leading to the October Revolution. Following the Revolution's conclusion, revolutionary Sun Yat-sen was made temporary President of the Provisional Republic of China in 1911. Later, following the abdication of Emperor Puyi in 1912, Sun became the leader of the Guomindang (Chinese Nationalist Party; also spelled Kuomintang). However, by 1913, Yuan Shikai seized power and soon after Sun was exiled. In 1916, Li Yuanhong replaced Shikai, though Li's control of the government remained limited, and Premier Duan Qirui held a majority of power until 1926.

The Guomindang experienced many problems. Most notably, the revolutionary upheaval resulted in destabilization, allowing parts of China to fall under the control of warlords. Social unrest resulted in the May 4th Movement in 1919, in which 3,000 students and professors flooded Tiananmen Square protesting the government's weaknesses. This protest radicalized members of the New Culture Movement in China, and 2 years later, they formed the Chinese Communist Party. In 1922, the Guomindang government forged an alliance with the CCP, leading to an offensive against the regional warlords.

The Northern Expedition (1926–1928) resulted in military victory over many warlords, and the remaining warlords chose to recognize the Guomindang government. Guomindang military leader Chiang Kai-shek was given the position “Chairman of the State Council” in 1926. Chiang brought drastic reforms to the area of foreign affairs, where relations began to improve. However, in 1927, the coalition between the Guomindang government and the CCP ended, with the CCP shifting its focus to cities and rural provinces, bringing social, land, and education reforms. Chiang opposed

CCP actions and began “Bandit Suppression” campaigns in 1931. The most famous campaign resulted in CCP’s Long March (1934–1935).

Conflict With Japan

During this period, Chinese-Japanese relations remained tense. Following reports that Chinese terrorists had attempted to destroy a Japanese railroad line in 1931—subsequently demonstrated to be a Japanese ploy now known as the Mukden Incident—the Japanese Kwantung army seized the city of Mukden as well as the rest of Manchuria from China. Rising tensions between the two countries eventually forced the CCP and Chiang Kai-shek into another alliance, called the Second United Front. In 1937, following the Marco Polo Bridge Incident, the Second Sino-Japanese War began in earnest, signaling the beginning of World War II in Asia.

As the Japanese Kwantung army pressed toward Nanking, the Guomindang abandoned the city and retreated west to the city of Chongqing (Chungking), which became the temporary Chinese capital for the remainder of the war. The Japanese military, on arriving in Nanking, began a reign of rape, murder, and terror known as the Rape of Nanking. Backed into a corner at Chongqing, the Guomindang faced a possible collapse, but with foreign countries providing aid, the war fell into a stalemate between Japan and China. Ultimately, however, American involvement in the Second World War resulted in Japanese defeat by 1945.

The Rise of Communism in China

The Chinese Civil War resumed with full force with the surrender of Japanese forces. Despite significant support offered to Chiang’s forces, as well as an effort to negotiate a political settlement by General George Marshall, the Chinese Communists prevailed in the Chinese Civil War. In 1949, Mao Zedong proclaimed the PRC.

Chiang and significant parts of his government and army fled to Taiwan and maintained that they were the only legitimate government of China. Initially, the United States moved to cut ties with Chiang after the Civil War, but the outbreak of the Korean War led to a reversal of U.S. policies. The United States refused to recognize the PRC and maintained that the Republic of China remained the legitimate government of China. The United

States provided Chiang with defense guarantees and moved significant naval forces to protect Taiwan from a possible invasion. Until 1971, the Republic of China would hold China’s UN seat and serve on the Security Council.

Mao and the Communist Party created a command economy that nationalized industry and collectivized agricultural production. Mao’s regime did stabilize the economy in the early 1950s, certainly aided by a period of peace after several decades of war. At the same time, Mao’s economic management would suffer a major failure in the 1950s under the Great Leap Forward, a 5-year program that sought to dramatically increase industrial production. This program failed miserably and led to widespread famine.

Mao’s regime did not tolerate political dissent. For instance, Mao fostered a cultural revolution in the mid-1960s that sought to undermine traditional centers of power within Chinese society. Empowered by Mao, youth in the Red Guard carried out a widespread purge of the Communist Party and elements of society deemed counterrevolutionary. Stability would be restored in 1967 by the intervention of the PLA.

Militarily, the PRC engaged in several armed conflicts. In 1950, Mao’s forces moved into Tibet and annexed the country. In November 1950, China entered the Korean War after UN forces approached the Yalu River border. Chinese intervention resulted in a serious defeat for American forces and ended U.S. enthusiasm for liberating North Korea from Communism. The Korean War ended in a stalemate in 1953 and served to heighten American fears regarding the spread of communism in Asia.

The Chinese military has not attempted to invade Taiwan, but in the late 1950s, it did shell the islands of Quemoy and Matsu in an effort to dislodge Chiang’s forces. In 1962, China launched a limited ground war against India to resolve a border dispute. In 1974, the Chinese seized control of a South Vietnamese island in the Paracel chain. A border war also broke out between Vietnam and China in 1979.

Initially, Mao firmly aligned the PRC with the Soviet Union; this would further raise U.S. fears about the threat of global communist aggression. In the late 1950s, however, Mao broke with the Soviet Union and pursued an independent foreign policy. Under President Richard M. Nixon, the United

States began an initiative to establish relations with the PRC in order to further separate the PRC and the Soviet Union. Nixon visited China in 1972, and in 1979, the United States established full diplomatic relations with the PRC.

Political instability followed Mao's death in 1975. Initially, the Gang of Four, a political faction that included Mao's widow, Jiang Qing, attempted to maintain Maoist orthodoxy. Ultimately, they would be toppled from power and disgraced. In their place would emerge moderate and pragmatic leadership under Deng Xiaoping. Under Deng, the PRC moved to open markets to international investment. The leadership also moved to reduce the amount of state control over the economy, a trend that would accelerate dramatically in the 1990s. Although elements of a command economy survived, the egalitarian ethos of the Maoist years was fully discarded by the 2000s, and a capitalist model was embraced. Great fortunes were made, but many urban workers and peasantry lost the social safety net that existed for them during the Maoist years.

Economic liberalization has not been matched in the political arena. Although authorities did allow for greater individual autonomy, especially in areas of personal dress and lifestyle, calls for ending the political monopoly of the Communist Party have been silenced. There has been social turmoil in recent decades, and some Chinese have demanded greater political freedom. Increasing social unrest resulted in the First Call for Democracy in 1978. Intellectuals began to write down their grievances, posting them on what became known as the Democracy Wall. Most participants in these movements faced arrest, and the Democracy Wall was shut down in late 1979. Later, 1986 brought the Second Call for Democracy, during which protests were held in major cities. Leaders of the movement were targeted and arrested, and those involved lost their party membership and any rights associated with being a party member. Furthermore, the party dismissed Hu Yaobang, a popular champion of education based on academic merit, whom officials blamed for this incident.

Tiananmen Square

By 1989, a number of ongoing economic and social issues led to increased unrest among some elements of the Chinese populace. China lacked a skilled

workforce, and economic inequality was growing. The population had grown too large for resource and job production to keep up. Student calls for freedom of speech and the press and increased funding for higher education resulted in no significant political reform. Additionally, public awareness of corruption within the government caused a spike in calls for the removal of dishonest officials. At the same time, the USSR was starting to crumble, and Soviet leader Mikhail Gorbachev began to implement new political reforms through programs of *glasnost* and *perestroika*. With even the USSR pursuing governmental reform, Chinese questions regarding the government only increased.

The death of Hu Yaobang, a former General Secretary of the Central Committee and Chairman of the CPC on April 15, 1989, saw Tiananmen Square flooded by students and intellectuals mourning his death; the mourning soon gave way to more strident calls for reform. The crowd called for democratic reforms, for participants in the Democracy Wall protest movement to be freed, and for Hu to be posthumously reinstated as a member of the Communist Party in good standing. The protestors demanded to speak with either Chairman Deng Xiaoping or Premier Li Peng. By May 4, the crowd at Tiananmen Square had swelled to around 100,000 people, prompting Deng to declare the demonstrations unlawful. This failed to quell the protest, with similar movements beginning to appear in cities other than Beijing.

In mid-May, Gorbachev visited China; it was customary to receive foreign dignitaries at Tiananmen Square. However, the ongoing protests made this impossible. With Gorbachev's visit, the crowd declared a hunger strike. On May 20, the government declared martial law, but the crowd decided not to leave and instead created the "Goddess of Democracy," a plaster and Styrofoam replica of the Statue of Liberty. On June 3, the government, feeling that the protests had begun to erode its authority, sent tanks to Tiananmen Square to break up the crowd. The tanks blocked exits and opened fire, while the protesters responded with rocks, sticks, and Molotov cocktails. By June 5, the crowd had fled the square. It was during this chaos that the famous picture of the man standing alone in front of a tank was taken.

As a result of the Tiananmen Square Incident, General Secretary Zhao Ziyang was placed under

house arrest; shortly thereafter, Deng Xiaoping retired as Chairman of the Central Military Commission.

The 1990s Recovery

By the early 1990s, the inflation problems that had in part led to the 1989 Tiananmen Square incident had abated. However, the incident left the PRC an international outcast. For the next 3 years, Communist hard-liners took control of the government and severely limited free enterprise. They also struggled to revive Maoist ideology, but the public reacted with disinterest. The CCP faced further challenges following the fall of communism in Eastern Europe, the worst embarrassment following the fall of the Romanian leader Nicolae Ceaușescu, a staunch ally of the PRC.

China's government continued to welcome foreign business and investment during the first part of the 1990s. While the Chinese government experienced some further opposition, the hard-liners never offered a serious challenge as they remained divided and lacked leadership. Notably, in April 1990, Li Peng, Premier of the PRC, arrived in Moscow where he met dozens of Soviet protesters labeling Li as a butcher. During his visit, Li rejected the idea of *glasnost* and *perestroika* being applicable for China.

By early 1992, Deng Xiaoping had reentered the public arena by touring southern China to restore faith in his reforms and to prevent a return to Maoism. During this time, Jiang Zemin became CPC General Secretary, President of the PRC, and Chairman of the Central Military Commission. By the mid-1990s, however, a number of issues with Deng's reforms remained. It became clear that many state-owned businesses remained unprofitable. As urbanization increased, unemployment in urban areas became an issue, and an urban housing shortage resulted in the creation of low-income slums in cities with major urban centers like Shanghai and Guangzhou.

It was during the 1990s that the Weiquan movement began. The Weiquan movement initially attempted to protect consumers' rights but gradually shifted into the political arena. Participants fought for their economic and political rights by attempting to gain help through the court system, pleading their case to the media, and forming demonstrations. Though some of this movement's

supporters were imprisoned without charge through the "Reeducation through labor" system, the movement had made some progress, most notably in the 2003 abolition of the custody and repatriation system, which allowed officials to remove people from cities who were deemed to not have a permit to live in a residence there.

In February 1997, Deng Xiaoping died, and his successor Jiang Zemin gave Deng's official eulogy, cementing his position as Deng's successor. In the wake of Deng's passing, his ideology became canonized as Deng Xiaoping theory, the official guiding ideology in the national constitution.

In July 1997, Hong Kong returned to PRC control after a 99-year lease with Great Britain ended. Its return highlighted Deng's One Country, Two Systems ideology, which suggested that China could have independent regions with their own capitalist economic and political systems, while China still used the socialist system. Under this policy, Hong Kong was able to maintain independence from China in all areas except foreign affairs and defense. In 1999, Macau returned to Chinese control from Portugal under a similar agreement.

Also of note, in 1997 Jiang visited the United States and met with President Bill Clinton. In return, President Clinton traveled to China in 1998. These meetings helped foster a better relationship between China and the United States. However, these attempts at good relations would soon be tested when American-led North Atlantic Treaty Organization forces bombed the Chinese embassy in Belgrade during the Kosovo War, resulting in the death of three Chinese journalists. This event created a strong anti-American sentiment in China, and though the incident was declared an accident, official apologies and statements regarding the matter did little to quell the anti-American sentiment. However, the Chinese government officially condemned the anti-American protests.

China in the 21st Century

By the turn of the century, China possessed a fairly healthy economy with an increase in foreign investment, but China also began to feel more international pressure regarding its treatment of its citizens. Human rights became a central concern for Western countries and formed a point of emphasis during Westerners' visits to China.

In April 2001, a U.S. Navy EP-3E ARIES II signals intelligence aircraft collided mid-air with a PLA Navy J-8II interceptor fighter jet near Hainan, resulting in an international incident known as the Hainan Island incident. The collision resulted in the death of the Chinese pilot and an emergency landing of the American aircraft on Chinese soil. The 24 crew members of the American plane were detained on Chinese soil and interrogated. After 10 days, the crew was released, but the cause of the crash remains unknown, as the Chinese government still retains control over both planes' black boxes and refuses to release any information. The release of the crew members followed the "letter of the two sorries" that was delivered by the U.S. ambassador Joseph Prueher to the PRC foreign minister Tang Jiaxuan to defuse the incident. The United States clarified that the letter was not an official apology, but the letter did express sorrow and regret over the incident that occurred.

Also in 2001, China and Russia signed the 20-year Treaty of Friendship and Cooperation. The treaty was designed to increase Sino-Russian cooperation and provide mutual assistance in economic, diplomatic, energy, ecological, and military areas. China and Russia were also able to agree on a defined border between the two countries.

In 2002, Jiang Zemin resigned from his position in the Politburo Standing Committee of the CPC and was soon replaced by Hu Jintao. In addition, Wen Jibao, a former ally to leader Zhao Ziyang, was promoted to premier, replacing Zhu Rongji. Despite Jiang's retirement, for several years Jiang continued to exert influence on the new administration.

Hu initially appeared open to democratic reforms. Hu wanted to allow people to have local representation, but conservative leaders in the Communist Party were upset about the implications of that move. In 2003, Hu laid out a plan to slowly allow more democratic participation, beginning at the township level and rising to national elections by 2018. None of these plans has borne fruit, however.

The Hu administration also dramatically increased restrictions on Internet use, which had been in place since 1996. These restrictions not only block specific websites and content but also monitor individual Internet access. These restrictions have become known colloquially as the "Great Firewall." Many activists have found ways to subvert these limitations, but there has also been a significant amount of self-censorship to prevent any possible

repercussions. The Chinese government has demonstrated its willingness to fine and imprison individuals for violating Internet restrictions.

Facing pressure from the party and military, Jiang resigned as Chairman of the Central Military Commission in September 2004. Though Hu and Wen continued to support Jiang's policies, the new leadership increased focus on the poorer areas of the Chinese population.

In 2008, a series of uprisings and protests began in Lhasa, the capital of Tibet, which subsequently spread to the rest of Tibet. Beginning on March 10, Tibetan Uprising Day, the protests became increasingly chaotic as rioting, looting, and burning swept across the country. With many Tibetans desiring independence from the PRC, the violence soon targeted ethnic Chinese living in Tibet. During the uprising in Tibet, foreign media were not allowed to enter Tibet, and journalists already in Tibet were told to leave. The PRC believed that the uprising was instigated and coordinated by the Dalai Lama, who has denied any involvement. In addition, the PRC claimed that the rebellion resulted in only 18 deaths, while the Tibetan government in exile believes that at least 99 people died. This incident occurred shortly before the 2008 Beijing Olympics, which focused global attention on Tibet and Chinese human rights violations. Since 2008, the PRC has made efforts to improve Tibet, adding new railroads, communication, and industries.

In addition to coping with issues in Tibet, the PRC began to have problems in Xinjiang, a western province that is predominately Muslim. Xinjiang has also made calls, like Tibet, for complete independence from the PRC. As a result, some extremist groups bombed trains, buses, and attempted a suicide bombing of a China Southern Airlines flight in 2008. The PRC has responded to these uprisings by sending in the PLA to quell dissent.

Many controversies arose when China was chosen to host the 2008 Summer Olympics. Outside commentators focused on Chinese human rights violations, China's support for oppressive governments, and air pollution in Beijing and its surrounding areas. In addition, there were reports that the Beijing Olympics could be targeted by a terrorist group or by pro-Tibetan protestors. Some commentators even pushed for boycotts of the Olympics—calls that ultimately went unheeded. In the end, the Chinese Olympics went ahead as scheduled and were free from any terrorist attacks.

Taiwan remains a thorn in the PRC's side. The PRC claims that Taiwan remains under its sovereignty and rejects the independence of the Republic of China. When Hong Kong returned to Chinese control, Taiwan called for independence. The PRC warned that military action would be used if Taiwan pursued this claim or if reunification was made impossible. Recently, Taiwan has grown closer to the PRC, largely as a result of mutual economic growth. However, the United States has continued to support Taiwan and maintains unofficial relations with the Republic of China government.

China continues to experience political and economic instability. There remains a desire to continue capitalistic reforms, but these have resulted in instability and led to growing economic inequality, population dislocation as rural Chinese migrate to urban centers, and pollution. Economically, the United States has been one of the largest consumers of China's goods and has built up a large trade deficit with this country. American imports from China are sustained in part by the willingness of the Chinese to finance the American national debt by purchasing U.S. government bonds. Monetary policy remains a point of contention between the two countries. Many within the American business community complain that China's currency is undervalued and needs to be raised to reflect the strength of the Chinese economy (and also raise the price of Chinese goods on the global market and in turn lower the relative cost of American-made products).

The year 2012 witnessed a transfer of power to Xi Jinping, and he was selected as China's paramount leader and elected to office of Party General Secretary with Li Keqiang as premier. Many have questioned the freedom of action Xi Jinping and Li Keqiang will have, given the increased size of the politburo. There is growing public dissatisfaction with increasing corruption among the many party and government officials and the wealth they have amassed. Growing pollution, catastrophic failures in public works (i.e., collapse of bridges and train derailments), and the failure to protect the health and safety of citizens from unsafe products have led to public protests in defiance of the government.

The Chinese Military

With 1.25 million active-duty personnel serving in the ground forces, China maintains one of the largest

standing armies in the world. Military conscription is universal, but large numbers of draft-age individuals are exempt. The ground forces are organized into 18 ground armies, 18 motorized infantry divisions, 22 motorized infantry brigades, 8 mechanized infantry divisions, 6 mechanized infantry brigades, 9 armor divisions, 9 armor brigades, 2 artillery divisions, and 17 artillery brigades. The ground forces possess 7,000 tanks and 8,000 artillery pieces. The Chinese air force maintains 3 airborne divisions, and the Chinese have a marine force consisting of 2 amphibious divisions.

The Chinese navy is organized into a North Sea Fleet and East-South China Sea Fleet. Significantly smaller than the U.S. Navy, the fleet includes 26 destroyers, 53 frigates, 48 diesel attack submarines, and 5 nuclear attack submarines. In 2012, the Chinese navy acquired its first aircraft carrier, though it has limited capabilities. In terms of air power, the Chinese military possesses 2,120 combat aircraft, including 1,570 fighters and 550 attack aircraft/bombers. The Chinese nuclear forces includes between 50 and 75 intercontinental ballistic missiles and 52 intermediate range ballistic missiles.

Significant debate exists among defense analysts, military leaders, diplomats, and civilian leaders outside China regarding the capabilities of the Chinese military and the country's long-term aspirations. Historically, China has been conservative in the use of force and has engaged in armed conflict only along its borders (i.e., Korea, Tibet, India, and South China Seas). In contrast to either the Soviet Union during the Cold War or the United States since 1940, China has not sought to project military power globally through foreign military bases or the deployment of forces outside Asia. Instead, it has relied on economic investments, trade, and soft power initiatives to further national interests internationally. The Chinese navy has, however, deployed forces to the Gulf of Aden as part of a multilateral effort to suppress piracy emanating from Somalia.

The Chinese military has traditionally remained subservient to the civilian leadership of the CCP. Given the nature of the Chinese government, the military's role in influencing Chinese governmental policy is often difficult to discern. The Chinese military possesses significant economic power through ownership of a number of profit-making businesses. With regard to military spending, the Chinese government publicly set outlays at \$106 billion in 2012,

but military spending is not transparent and is certainly higher than reported.

China, North Korea's only ally, has acted as intermediary between this isolated regime and the international community. China has forestalled harsher international action against North Korea and has moderated the actions of this rogue regime. In the wake of North Korean nuclear tests, however, in 2012 China voted in the United Nations to put economic sanctions on North Korea as punishment for these tests, reflecting a change in strategic policy.

In addition to rising issues with North Korea, China and Japan's relations have remained contentious. Both countries claim the Ryukyu Islands, which have been under Japanese control since the United States ended a period of control lasting from 1945 until 1971. China had held control over these islands until 1879, when Japan took control, and since their return to Japan, China has contested the current political situation. Furthermore, China continues to have border disputes with India, which became an issue of contention as early as 1914 and escalated into a month-long Sino-Indian War in 1962, which ended with a Chinese call for a cease-fire.

As the world's second largest economy, China has the ability to sustain and continue to modernize one of the largest armed forces in the world. China has been more willing to assert its growing power in Asia and has been aggressive in asserting territorial claims in the South China Sea. Whether it seeks to project military power globally is an open question. Although the prospects for CCP to give up their monopoly remain dim, the Chinese middle class is growing exponentially and may exert pressure for a more democratic system of government.

CITADEL, THE

The Citadel is a state-supported military college located in Charleston, South Carolina. Founded in 1842 as the South Carolina Military Academy, its alumni have served in all conflicts since the Mexican-American War. Since its inception, The Citadel's goals were educating its cadets within a military environment and instilling in them the traits of honesty, integrity, and responsibility. The Citadel is one of the six Senior Military Colleges in the United States. As a Senior Military College, all on-campus students must be members of the Corps of Cadets at The Citadel. It also offers Reserve Officer Training Corps classes for all the branches of the military. Furthermore, cadets must wear uniforms at all times and take these classes. Although The Citadel does not require the mandatory commissioning of its cadets, approximately 40% do eventually take a commission in one of the four branches of the military.

In 1842, the South Carolina governor John P. Richardson called for opening The Citadel as a military academy, hoping it would produce useful citizens. It opened in 1843 with an enrollment of 34 students. Since then, The Citadel has produced more than 20,000 graduates, counting senators, flag officers, governors, chief executive officers, presidents of universities, and many other notables. The college now enrolls approximately 2,000 undergraduate students. Originally only offering three degrees—civil engineering, the sciences, and literary studies—The Citadel now offers a total of 20 majors, ranging from computer science to psychology.

Throughout its history, The Citadel has been an insular organization, set in its ways and resistant to change. Over the past several decades, the institution has worked to lose that stigma. In 1966, The Citadel admitted the first African American cadet, although it was far from an open acceptance of Blacks.

The road to racial diversity has been rough, but minority cadets now often find themselves in positions of authority in numerous roles throughout the campus and make up about 17% of the Corps of Cadets. In the early 1990s, The Citadel and the Virginia Military Institute (VMI) were both embroiled in lawsuits regarding their male-only admissions policies. The Citadel was successfully sued by Shannon Faulkner in 1995; as a result, she became the first woman to be admitted to the school as a cadet. After several years of legal battle between the U.S. Attorney General and VMI, the VMI lost its case. During the months of VMI's deliberation of whether to go coeducational or to become a private all-male college, The Citadel went coeducational. This marked a severe shift in the policies of the school, one that had polarized school officials, students, and residents of Charleston for quite a period of time. Today, female cadets are a common sight around the campus, making up 6.4% of the full-time student body. In 1997, following The Citadel's lead, VMI went coed as well.

In the past two decades, Citadel alumni have served in Operations Desert Shield and Desert Storm and the ongoing wars in the Middle East. During that time, the college's most prominent graduates have commanded the Blue Angels and the 1st Cavalry Division and served as the U.S. Marine Corps' Director of Intelligence. Since the beginning of the Global War on Terrorism, 14 Citadel alumni have fallen in the line of duty.

Academics at The Citadel

As of 2009, The Citadel enrolled 2,288 undergraduates. Of these students, approximately 2,100 are cadets who live on campus and in barracks. The cadets wear uniforms, attend mandatory formations and meals, and partake in various military duties and ceremonies throughout the week. For in-state residents, the cost of attending The Citadel as a freshman for the 2009–2010 school year was \$21,729, while it was \$17,663 for upperclassmen. For out-of-state residents, the cost of attending as a freshman for the 2009–2010 school year was \$35,539, while upperclassmen paid \$31,473. During the Fiscal Year 2007–2008, The Citadel had revenue of \$91,435,042 and expenditures of \$87,935,319.

During the 2008–2009 school year, The Citadel had 252 faculty members, of whom 173 served full

time. The faculty was composed of 167 men and 85 women, including 26 minorities. Of the faculty members, 191 have a doctorate. The three largest concentrations of faculty were in business administration, English, and history. The student-to-faculty ratio was 15:1, including part-time and graduate students. A total of 618 different classes were taught in the Fall 2008 semester, with the most common class size being 20 to 29 students. No classes had more than 99 students. The majority of classes had between 10 and 29 students.

The college divides its undergraduates among 16 majors, the three most popular being business administration with 618 students, criminal justice with 290, and civil engineering with 207. Students in all fields must take a core curriculum of four semesters of English, two semesters of history, two semesters of math, four semesters of science, and one semester of a social science. Those majoring in a nonprofessional field must also take four semesters of a foreign language. The three sciences that students can choose from are chemistry, physics, and biology. The foreign languages consistently offered at The Citadel are Spanish, German, and French, with other languages available on an irregular basis.

CIVIL AFFAIRS

Since the Revolutionary War, the U.S. military forces have faced the task of restoring order to civilian communities and rebuilding during times of war. For years, military commanders organized impromptu solutions until the institutionalization of civil affairs and military government during World War II. Since their establishment, U.S. Army Civil Affairs (CA) forces have proved themselves vital to the success of winning wars, securing peace, and laying a foundation for stability in troubled nations around the world. This entry discusses the history of military civil affairs from its institutionalization during World War II through its numerous deployments and increasing importance in unconventional conflicts, including the wars in Iraq and Afghanistan.

When deployed, CA forces perform numerous jobs critical to the success of both combat and noncombat operations. The first objective of CA forces surrounds support for conventional combat operations through the minimization of civilian interference, mobilization of civilian resources, and assessment of humanitarian and infrastructural needs. CA forces also provide critical support for Special Operations Forces' counterinsurgency (COIN) operations, aid to local and national government ministries struggling to rebuild, and assistance at times of natural disasters and civil disorder. Moreover, CA soldiers specifically contribute valuable expertise in the areas of rule of law, economic stability, governance, public health and welfare, and infrastructure as well as public education and information. Mission life cycles typically begin with humanitarian assistance, and as crises ease, efforts transition to assessments, long-term development plans, and institutional reconstruction.

Historically a U.S. Army capacity, modern CA forces comprise both active-duty and reserve soldiers principally within the army but more recently in other branches. Since the Vietnam War, the majority of CA forces are reservists and constituted roughly 90% of the force well into 2011. The remaining 10% resided in the active-duty 95th Civil Affairs Brigade. Reservists bring invaluable career experience in CA specialty areas but are limited in their ability to perform at combat operation tempo when deployed alongside active combat units. Due to skyrocketing demand, the Department of Defense

plans to increase the active-duty component to 26% by 2013 and have formed the 85th Civil Affairs Brigade to reach that goal. Army CA forces primarily train and are stationed at the John F. Kennedy Special Warfare Center and School at Fort Bragg, North Carolina. Multiple training programs prepare officers and enlisted personnel, including some marines, for CA missions through training in area studies, leadership, technology, and language. The CA graduates continue a legacy that formally began during World War II.

The Birth of U.S. Civil Affairs

Despite notable military government missions during the Mexican-American War, American Civil War, Spanish-American War, and World War I, the institution of military CA only coalesced prior to World War II. Not long after World War I, Colonel Irwin L. Hunt warned that soldiers lacked the training for U.S. military government in the postwar German Rhineland. The report began a struggle for defined policy that culminated in the 1930s issuance of Field Manual (FM) 27-10, *The Rules of Land Warfare*. Eventually, the judge advocate general published the first dedicated manual for military government and civil affairs in 1943, FM 27-5, *Civil Affairs and Military Government*. The manual explained the policy and procedure of military governments in enemy territory and civil affairs: a less aggressively named military government policy for friendly occupied territory.

Although the responsibility for CA shifted throughout the War Department, military leaders pushed ahead with institutionalization as participation in World War II neared. Even if the leaders preferred to avoid the task of using the military to govern, international law required the restoration of law and order in occupied territory. On April 2, 1942, Secretary of War Henry L. Stimson established the first School of Military Government at the University of Virginia, Charlottesville, which soon graduated 175 CA officers every 12 weeks. The first CA training program combined area studies with practical public administration and language training. Many of the recruits during World War II contributed crucial career experience, and the inaugural class included men with careers ranging from police chief and city manager to utility specialist and city attorney.

As the U.S. military forces pushed across North Africa, hard-learned lessons persuaded leaders to give the military the responsibility for governance. President Franklin D. Roosevelt initially intended U.S. civilian government agencies to govern occupied territory, but agency failures proved that the military was the only force capable of such a daunting task. Fortunately, coordination organizations, including the State-War-Navy Coordinating Committees, successfully corralled resources and proved the importance of the military and U.S. civilian agencies working together. Throughout the war, CA forces not only successfully operated military governments but also managed massive humanitarian assistance operations and, as the war ended, inherited postwar reconstruction.

Rebuilding Germany and Japan quickly consumed thousands of CA soldiers as they worked to establish independent, democratic governments. Two approaches emerged between Germany, which had no government at all, and Japan, where the government largely survived the war. In Germany, CA officers were left to completely rebuild, instill democratic ideals, finish denazification, and develop long-term economic recovery plans. Unfortunately, disagreements and slow cross-region coordination between Western occupying forces left West Germany without a central government until 1949. Alternatively, in Japan, the retention of a largely intact indigenous government permitted General Douglas MacArthur to coordinate a less-imposing top-down approach. With Japanese officials in charge, CA teams primarily monitored the reform process, assisted in elections, and advised local officials on issues they had not encountered under a totalitarian government. By 1952, the Japanese government successfully recovered independence, while the demand for CA forces only increased in conflicts throughout the Cold War and beyond.

Cold War and Beyond: Civil Affairs' Coming of Age

Dynamic Cold War-era conflicts soon pushed CA beyond the confines of World War II military government and tested many other skill sets of civil-military operations (CMO). The Korean War witnessed U.S. CA forces' first serious encounter that required coordination between the larger UN mission, non-governmental organizations (NGOs), and the inde-

pendent government of the Republic of Korea. Making matters worse, radical shifts in the battlefront curtailed development projects and forced CA forces to contribute as best they could, often limiting them to humanitarian and refugee aid. As the CMO dynamic changed over time, so did the doctrine, as FM 41-5 *Joint Manual for Civil Affairs*, and FM 41-10 *Civil Affairs Operations* signaled the shift away from military governance doctrine. During the Vietnam War, CA temporarily transformed into Civil Operations and Revolutionary Development Support (CORDS) to better combat the Viet Cong guerrilla insurgency. After its inception in 1967, CORDS assumed control of nationwide civil affairs efforts in South Vietnam, unifying U.S. Army and the U.S. Marine Corps Combined Action Platoon and civilian agency programs and resources. The CORDS' multifaceted strategy included psychological operations, work alongside Special Forces with indigenous Montagnard tribes, and the controversial Phoenix program. Even though CORDS secured many victories, the Vietnam War ingrained an aversion to nation-building and long-term development projects that diminished the effectiveness and limited the potential of successive CA operations.

In the final years of the Cold War, avoidance of nation-building hampered intensive CA operations, but CA soldiers nevertheless continued a legacy of meaningful achievements. In Grenada and Panama, CA forces successfully met infrastructural repair and assessment demands and assisted with the restoration of governmental institutions. Later during the Persian Gulf War, advanced planning and multinational coordination within Task Force Freedom paved the way for a very successful CA mission. CA teams worked with combat maneuver units in a humanitarian capacity to manage civilians and prisoners of war, while other teams managed reconstruction and \$500 million in emergency services contracting. In Somalia, a small yet effective CA contingent developed a strategy to coordinate scores of NGOs through a remarkably successful Civil-Military Operations Center (CMOC). These deployments demonstrated that coordination and preemptive planning were absolutely essential to success, while most problems emanated from a lack thereof. Moreover, the disdain for nation-building fostered an organizational culture that increasingly underestimated and misunderstood the value of civil affairs.

Deployments during the 1990s echoed similar themes to earlier experiences, most notably CA forces' defiant spirit to overcome restrictions and successfully improve civilian quality of life in their area of operations. In the 1992 Haiti intervention, CA forces restored electrical service and provided much needed humanitarian support, in spite of restrictions on infrastructure projects and a divided CMOC that hamstrung coordination with NGOs. In Bosnia, CA forces once again found themselves chained to humanitarian missions due to restrictions. But a second-phase operation reversed this and opened a multinational effort to assist with elections, infrastructure, and long-term planning. While multinational coordination efforts proved difficult, resourceful CA soldiers devised creative solutions that combined mission goals of the North Atlantic Treaty Organization with projects that benefited civilians. Finally, in Kosovo, CA troops once more overcame a lack of preparation, short deployments, and resource restrictions to stem a refugee crisis and guide long-term institutional reconstruction.

Counterinsurgency and Stabilization Missions in the 21st Century

U.S. military operations in Afghanistan, starting in 2001, and Iraq, in 2003, became the single most influential experience for U.S. CA forces since World War II. Both wars stretched CA forces to their limits and drove military leaders to rethink their aversion to nation-building, and a more comprehensive use of CA assets. Demand for CA soldiers skyrocketed as they were spread thin across the two battlefronts in Iraq and Afghanistan, not to mention operations in East Africa and South Asia. Shortages spurred the expansion of Marine Civil Affairs Groups and the creation of the navy's own Military Civil Affairs Group, as the army fought to adapt and to increase its own numbers. Meanwhile, deployed CA soldiers' dwell times halved as CA reservists, only 5% of the reserve force, bore 23% of total reserve casualties. Civilian agencies tied to new coordinated Provincial Reconstruction Teams (PRTs) also struggled to find recruits in their effort to relieve their own personnel shortages. Nevertheless, Defense Secretary Donald Rumsfeld divorced CA reservists from Army Special Operations Command in 2006, a move condemned

for harming deployment scheduling, training, and equipment access.

The PRT emerged in Afghanistan in 2002 as the primary vehicle for CA and CMOs. Initially called Coalition Humanitarian Liaison Cells, PRTs included two military CA teams augmented by representatives from the Departments of State and Agriculture and the U.S. Agency for International Development. The two teams split between quick impact development projects and traditional CMOC coordination efforts with the United Nations and NGOs. Strategically located in provincial capitals, the teams sought to extend the influence of the central government. Over time, all Afghan PRTs came under the North Atlantic Treaty Organization's International Security Assistance Force control, and by 2009, 19 partner countries took ownership of various PRTs. While military and civilian teams strived to improve conditions in their regions, separate chains of command within U.S. PRTs and lack of multinational coordination on objectives and accountability metrics demonstrated pervasive weaknesses with PRTs and CMOs.

As the war in Iraq worsened, the PRT model was introduced in 2005 and grew a multilevel program with teams at provincial and local brigade and regimental combat team levels. The first PRTs included up to 80 personnel, mainly civilians from the Departments of State, Agriculture, and Justice and the U.S. Agency for International Development, as well as a representative from the Army Corps of Engineers, CA and military liaison officers, and Iraqi personnel. Teams focused on governance, reconstruction, and security and sought to assist and embolden traditionally weak provincial and local authorities. Later during the 2007 Iraq troop surge, President George W. Bush assigned smaller embedded PRTs to local brigade and regimental combat team levels. Embedded PRTs developed strategies to connect communities and utilize Commander's Emergency Response Program funds and the State Department's Quick Relief Funds to sponsor local initiatives and projects ranging from hospital and school repair to women's centers for legal rights. Both embedded PRTs and PRTs in Iraq and Afghanistan intentionally operated in relative obscurity to give credit to local officials rather than American occupiers. This lack of transparency provoked criticism in the United States where observers

experienced difficulty tracking PRT accomplishments and spending. As the Iraq War neared its end, PRT missions concluded in September 2011, 1 month prior to the release of FM 3-57 *Civil Affairs Operations*, which incorporated many of the lessons learned in the past decade.

The future of CA remains uncertain except for the demonstrated need for soldiers with the skills and expertise to not only win wars but also secure peace in regions fraught with conflict. Defense Department plans to increase the active component of CA will only improve their effectiveness and capacity for future missions that build on hard-earned lessons and improvements in Iraq and Afghanistan. Indubitably, the unpredictable irregular wars of the future will watch CA forces and doctrine adapt to new challenges and conquer old weakness.

CIVIL DEFENSE

The events of September 11, 2001, ushered in a new era in American history. Never before in the history of the nation had such damage or loss of life been heaped on the people of America by an amorphous nonstate organization clearly bent on destroying the United States. The source of the threat notwithstanding, the asymmetric effects of the attack spawned an avalanche of homeland security public policy documents, most of which were focused on preventing, protecting from, responding to, and recovering from acts of terror. The focus of these policy documents was, is, and will likely remain a top-down approach to counterterrorism and anti-terrorism. This entry discusses civil defense policies, strategies, and departments in the federal government from post-World War II to the present.

The Department of Homeland Security, established in 2003, is the executive branch department charged with leading and coordinating national preparedness efforts at the national, state, and local levels. The involvement of the Department of Defense in this effort has been haphazard at best and continues to be problematic for officials at the national level. Though the recent history related to homeland security seems daunting, there are many parallels to civil defense programs dating back to the end of World War II.

With the advent of the destructive power emanating from nuclear weapons, scientists, politicians, and citizens seemed to acknowledge that life in America had changed forever and not in a positive way. Then, in 1949, when the Soviet Union exploded its first nuclear weapon, the federal government began the process of organizing the defenses of the nation to deal with the potential catastrophic outcomes related to nuclear attacks. The efforts to develop a cohesive defensive strategy for nuclear war became far more difficult than might have been thought. Early on, because so little was known about the full effects of nuclear weapons, the attempts to develop comprehensive policies were hampered by constant reorganizations and reassignment of responsibilities among different agencies. The problems associated with developing strategies were often plagued by distinct differences in defense philosophies as well as significant mismatches between what was proposed

and the resources available to complete the proposed programs. Throughout most of the Cold War, the conflict in philosophies inhibited nearly every administration and Congress from developing and implementing a comprehensive civil defense program.

The major philosophical differences could be found in those who advanced the defensive strategy of sheltering citizens and officials and those who believed in evacuation of urban areas. Furthermore, the advancement of various nuclear offensive strategies had significant influence on civil defense efforts. The great nuclear war thinkers of the Cold War, such as Herman Kahn, Thomas Schelling, and Bernard Brodie, each advanced ideas that, if implemented, would lead to quite different views on what defensive measures might be developed and implemented. Similarly, ambiguous assignments of responsibilities in the executive branch, including the Department of Defense, did not ease concern or uncertainty. Eventually, pacifistic antinuclear warfare interests began to temper offensive and defensive discussions related to the potential use of nuclear weapons in war. Likewise, the occurrence of major natural disasters began to influence presidents to advance the idea of “dual-use” capabilities, particularly at the state and local levels. This change would become a common theme from as early as the Nixon administration. The most significant change in policy, however, was that the emphasis was changing from worrying about nuclear war to focusing on the nascent concept of “all-hazards” emergency management. This new approach had more resonance with state and local governments, because nuclear war and its outcomes were not events to which lower level government could adequately prepare for or respond to. During the administration of Jimmy Carter, the Federal Emergency Management Agency was established to bring national government emphasis to events that were far more likely to occur. There was one administration that proved to be a notable exception, and that was the 8 years that Ronald Reagan was president.

President Ronald Reagan was a determined Cold War warrior who saw the world in clear colors. He was convinced that the Soviet Union and communism were evil and that the West, in particular the United States, had an imperative to diminish, if not eliminate, communism as a pernicious influence in the world. As long as the Soviet Union and its totalitarian government existed, true freedom could not be realized around the world.

The Reagan administration, in 1983, advanced the Strategic Defense Initiative, a modern version of creating an antiballistic missile “shelter” for the United States. Though the initiative was arguably a violation of ratified strategic arms limitation treaties, President Reagan insisted on establishing a ballistic missile defense office with its home in the Department of Defense.

President Bill Clinton named James Lee Witt as the Director of Federal Emergency Management Agency. Witt brought competence and expertise to the agency that changed the culture of the agency for the better. His efforts in building cooperation with state and local governments to develop awareness of and preparedness for catastrophic natural events were his most notable accomplishments. Also during the Clinton administration, the national government took action to fund and prepare for outcomes associated with weapons of mass destruction (WMDs). In particular, Congress sought to integrate civilian government activities with military capabilities by asking the Department of Defense to build civilian support teams when WMDs were involved. As late as 2000, the administration developed the Office of Homeland Security to integrate activities associated with the potential use of WMDs. This office, found in the White House, had interagency responsibilities.

One of the outcomes of the events of 9/11 was a rearrangement of military combatant commands. On October 1, 2002, General Ed Eberhart took command of U.S. Northern Command (NORTHCOM), a combatant command with responsibilities for military’s homeland security activities inside the United States. With the establishment of NORTHCOM came the reassignment of forces from Forces Command so that the new organization could have a full array of capacities and capabilities to support civilian authorities faced with catastrophic events, whether natural or human-made. Over time, however, NORTHCOM’s influence on homeland security policy has been haphazard at best. Far too often, military and civilian government cultures have been found to be incompatible. Of particular concern are the questions related to authority at event scenes and profound questions related to federalism. The Department of Defense has also had difficulty in the interagency arena dealing with federal agencies. Though charged with homeland security responsibilities, NORTHCOM has been ineffective

in fulfilling its mission to the satisfaction of the 39,000 general purpose jurisdictions that support the citizens of the United States. Perhaps no stronger evidence of this disconnect can be found than by examining the role of NORTHCOM in the response and recovery to Hurricanes Katrina and Rita and the recent BP (British Petroleum) oil spill in the Gulf of Mexico. Though the Coast Guard and the Corps of Engineers were highly visible, virtually nothing was heard about the role of NORTHCOM in supporting these events.

There appears to be a glimmer of hope for improving operations and cooperation between the Department of Defense and all those lower level governments. The wherewithal of NORTHCOM is without parallel when WMDs might be the cause of a catastrophe. Without the capacities and capabilities of the command, no civilian government would be able to mount a credible response. Thus, as the landscape of homeland security continues to evolve, NORTHCOM and civilian governments might eventually find common ground that benefits all parties.

CIVIL DISORDER

At the Constitutional Convention, America's Founding Fathers foresaw the need for a means to calm national tensions and factional disagreements inherent in a democratic society. While they understood the need for security, they worried about a reoccurrence of a polarizing situation like the Boston Massacre. Throughout the history of the nation, from the Whiskey Rebellion to anti-war protests against the Vietnam War, presidents have struggled to preserve law during times of civil unrest. This entry discusses the history and evolution of military intervention in civil disorder in the United States, including revolts against the federal government, violent labor strikes, and the role of the National Guard in responding to riots and assisting after natural disasters.

Constitutional Debate and Early Military Intervention

As the Constitutional Convention delegates gathered in Philadelphia in 1787, a large part of the debate stemmed from Shays' Rebellion. The previous summer, the popular uprising in Massachusetts had emerged from a debtor rebellion against the judiciary. The confrontation between an ill-prepared state and angry citizens proved the vulnerability of the government.

The debate prior to ratification focused around militias, states' rights, and the balance between civil and military forces. Although delegates understood the need for a federal intervention in case of a failure of civil law, they worried about congressional power over states' militias. They finally reached an agreement that allowed Congress to raise a military and enforce the law with specific requirements for intervention in civil disorder. The first legal precedent found in the Calling Forth Act and the Uniform Militia Act of 1792 allowed the federal government to deploy federalized militias if the civil authorities proved unable to enforce the law. Further safeguards required a state's appeal for help, judicial approval,

and a presidential issuance of a cease and desist order to the insurgents among other requirements. With this framework in place, the federal government's response to the Whiskey Rebellion established the first precedent of its use.

In 1794, President George Washington carefully set the first precedent for the use of a nationalized militia force in a civil disorder during the Whiskey Rebellion. The rebellion formed after a national excise tax on distilled liquor prompted widespread disdain on the western frontier, particularly in Pennsylvania. When civil authorities and local militias proved unable to enforce the tax because of violence, Washington intervened and issued a formal cease and desist ultimatum. Due to the nature of the dissent, which Washington deemed treasonous, he quietly raised a multistate militia and sent a more visible diplomatic party to investigate the troublesome counties. The delegation showed an effort to exhaust peaceful alternatives, while the administration awaited Supreme Court Justice James Wilson's confirmation of rebellion that circumvented Pennsylvania's initial insistence on confronting the unrest alone. Although the federal delegation found a large moderate faction, the delegates agreed with the suspicion that the president must use military force to fully quell dissent. Civil authorities, reinforced by more than 15,000 militiamen, successfully restored order with very few casualties. Ultimately Washington set a very cautious example of military intervention but uncertainty surrounding the expediency of using regular soldiers rather than militia remained.

Antebellum, Civil War, and Reconstruction

During the next 50 years, the development of use of force evolved as a variety of small disorders gave way to the ultimate confrontation over slavery. In 1807 after squelching the Burr Conspiracy, President Thomas Jefferson secured landmark privileges to employ federal soldiers in cases of domestic insurrection. The bill drafted by Jefferson and passed by Congress still required compliance with stipulations in the 1792 Calling Forth Act but rejected the widely held mistrust of the use of regular military forces in domestic civil disorder. In the following years, President Andrew Jackson ordered the first labor riot intervention in 1834, and President John Tyler chose not to intervene in the Dorr Rebellion, which decided the winning government in Rhode

Island; both were signs of future conflicts. During the Boston Slave Riot of 1854, Attorney General Caleb Cushing issued an opinion, later called the Cushing Doctrine, that supported military intervention to uphold the Fugitive Slave Law. The doctrine suggested that marshals had the ability under *Posse Comitatus* to call forth militia and military soldiers for support. The opinion, although relatively insignificant at the time, created the opportunity to circumvent important constitutional protections later during Reconstruction.

The onset of the Civil War marked a drastic change from a tradition of restricted military intervention as President Abraham Lincoln fought to reincorporate the Southern states. In 1861, Lincoln possessed more leverage in the use of force due in part to the removal of the 1795 judicial approval requirement and changes to the 1807 federal force law. This and the suspension of habeas corpus (the protection against unlawful detention) granted the War Department more leverage and leeway in dealing with insurgents, rebels, draft dodgers, and disloyal elements. During the war, the once-revered tool of the executive with protective prerequisites gained wider use among commanders and civil authorities with newfound discretionary powers. The 1863 draft riots throughout the Northern cities became the largest case of civil disorder that the War Department faced. Again, training and logistics between multiple leadership elements exercising their own discretion plagued their ability to control the looting and violence throughout the riots. As the war ended, the Reconstruction experience expanded the domestic use of military force even further.

Reconstruction witnessed a climax in the liberal use of military intervention in support of the Radical Republican agenda. New institutions, including the Freedmen's Bureau and the Civil Rights Act, placed federal soldiers in the role of enforcing national law concerning the civil rights of Blacks. Furthermore, the disbandment of Southern militias, seen as remnants of the Confederate Army, left the federal military to reinforce civil authorities. This raised enormous controversy because federal military forces became a tool of Radical Republican politicians, both at state and national levels, to protect their vision for America and the new South. Local and state officials increasingly understood and called for military assistance based on the Cushing Doctrine's summary of

Posse Comitatus. In resistance, the Southern White majority formed vigilante groups, including the Ku Klux Klan, that proved enormously destructive to the Reconstruction process.

President Ulysses S. Grant's experience with increased military authority in the final years of Reconstruction marked a reduction in the significant use of the military in civil unrest. Beginning in 1870, Grant wielded new powers under the Enforcement Acts to crush vigilantism in the South. While these measures proved successful in reducing violence, the federal government began a slow departure process that was completed by 1877 when White Democratic majorities retook control of Southern state governments. The following year, the Posse Comitatus Act of 1878, drafted by a Kentucky congressman, signaled a return to the constitutional limits of military intervention and the ironic death of the Cushing Doctrine initially intended to support slavery. The laws from 1861 and the Ku Klux Force Act strengthened executive power, but the Posse Comitatus Act removed the discretionary power enjoyed by civil authorities throughout Reconstruction. As Reconstruction ended, the military quickly found a new role in intervening in labor conflicts.

Labor Conflicts and Bonus Army

The late 19th century introduced the nation's military to the controversial role of ending labor conflicts between companies and workers. In the years that followed the Civil War, reoccurring devastating economic downturns wiped out workers' pay, while management consolidated power and wealth. The railroads, which had grown exponentially after the Civil War, witnessed the greatest strikes yet in American history. The Great Railroad Strike of 1877 marked a turning point in labor relations when a strike begun by railroad workers in West Virginia spread across the country. While primarily led by railroad workers, the strike spread to numerous industries where workers struck in solidarity, effectively shutting down railways and whole towns. Governors attempted to break the strikes with police, militia, and National Guard units, but defection and uncontrolled shootings incensed mobs that set out burning whole rail yards. An appeal by the West Virginia governor Henry Mathews stirred President Rutherford B. Hayes to action as federal

troops were deployed with Gatling guns and artillery to his state and others. Despite violent confrontations between strikers and assorted strikebreaking forces, the federal military with superior firepower restored peace with significantly less violence than their National Guard counterparts.

Years later, the 1894 Pullman Strike brought the federal government into another labor conflict in the Pullman company town outside Chicago, Illinois. The strike initiated by the high cost of living in Pullman's company town opened a larger boycott of Pullman train cars by Eugene V. Debs's nationwide American Railway Union. The then attorney general Richard Olney, a former railroad attorney, coaxed President Grover Cleveland into sending federal forces under the auspices of restoring U.S. mail flow caught in closed rail yards. The president did not notify Illinois governor John P. Altgeld before the deployment and faced Altgeld's vociferous complaint that his own National Guard could handle the strike. Until the deployment of federal troops, the strike remained calm, but the presence of soldiers quickly incited riots. Reinforcements and the indictment of strike leaders including Debs marked the end of the strike and fresh resentment of military forces for siding with business owners and breaking the union.

Although presidents continued to use military intervention to calm labor conflicts, the Progressive Era ushered in new mediation tactics to avoid undue violence. The Pennsylvania Anthracite Coal Strike of 1902 drew the attention of President Theodore Roosevelt, who intervened to avoid a coal shortage during the coming winter. Although National Guardsmen temporarily occupied the coalfields, the president shaped a practice of using mediation committees to resolve strikes. As the labor conflict intervention evolved, focus shifted to a new fear of Bolshevism and racial violence.

In 1932, many American veterans of World War I, both Black and White, suffered significantly from the onset of the Great Depression. Their service overseas during the 18-month U.S. participation came at a high cost with disproportionate pay to their counterparts engaged in war industries at home. A movement called the Bonus Expeditionary Force or Bonus Army emerged behind the veteran leader William W. Waters, who, along with the Veterans of Foreign Wars, pressed the government to pass the World War Adjusted Compensation Act. Veterans from across the country converged on Washington, D.C., and

set up camp along the Anacostia River while they lobbied Congress. When the Senate rejected the bill after an impressive effort that won a victory in the House of Representatives, President Herbert Hoover ordered the Bonus Army evacuated from the city. During the expulsion from their massive tent city along the Anacostia, a scuffle with police that ended with two veterans shot dead sparked military intervention. The military had previously drawn up plans in anticipation of a riot and swooped in with bayonet-bearing soldiers supported by tear gas, mounted cavalry, and tanks. Under the leadership of General Douglas MacArthur, the U.S. Army forcibly expelled the veterans and their families and set the tent city ablaze. Both the president and MacArthur voiced concern for communist undertones in the Bonus Army's effort to seek fair compensation. The expulsion upset the general public, soured Hoover's reelection bid, and drew criticism of MacArthur's excessive use of force.

Civil Rights and Urban Riots

Racial violence and unrest also grew as demographics shifted because of the Great Migration in the early 1900s. During this period, African Americans moved north for the higher pay and increased freedom of northern industrial cities. The Red Summer of 1919 witnessed some of the most violent racial clashes between Whites and Blacks across the country. Washington, D.C., and Omaha, Nebraska, among other places, experienced serious violence that required federal military intervention to restore peace. As military forces intervened, rumors of Bolshevik extremism associated with the suspicion of labor unions stigmatized the appearance of violence that stemmed from social and economic inequalities suffered in Black communities. As the causes for such incidents remained, so did the instances of unrest that lasted through World War II.

After World War II, military forces again faced unrest as the civil rights movement pushed to secure equal rights for African Americans. Conscious of past intervention, the federal military avoided involvement, while National Guard troops were increasingly called by governors to intervene in conflicts over integration in the final years of Jim Crow laws. In 1957, President Dwight D. Eisenhower famously used federal troops to integrate Central High School in Little Rock, Arkansas. Arkansas governor Orval Faubus initially deployed National Guard troops to

block integration in defiance of the federal government and the changing national opinion of segregation. Thanks to the 101st Airborne detachment and the nationalization of Arkansas's National Guard, integration resumed, and the students who became known as the Little Rock Nine had additional protection from angry Whites.

As the fight for civil rights continued, National Guard units found themselves in ugly conflicts, caught between the orders of their governors and individual feelings and convictions. During the 1962 integration of the University of Mississippi in Oxford, National Guard troops were called to defend federal marshals. The marshals were sent to protect James Meredith, the first African American student at Ole Miss, but found themselves besieged by a violent mob. The troops later recounted the shock of finding themselves on the receiving end of bricks, bottles, and bullets as they sped past barricades to rescue the marshals. The violence experienced in Arkansas and Mississippi, among many other states, taught the federal military to better plan and prepare for peaceful and swift control of outbreaks of civil disorder.

By the mid-1960s, urban areas across America hosted serious violent civil disorder and riots. One of the first such riots occurred in the Watts area of Los Angeles in 1965, where 34 people died before California National Guardsmen restored order. The riots all echoed pervasive tensions between Black and White communities, particularly concerning police brutality. Later in 1967, riots in Newark, New Jersey, and Detroit, Michigan, again destroyed millions of dollars of property and took scores of lives. The tremendous use of lethal force evidenced in the 10,000 rounds of ammunition fired by the National Guard in Newark highlighted its lack of training and preparation. New rules implemented after the summer of 1967 restricted the use of lethal force by military forces intervening in civil disorders. During riots in the wake of Dr. Martin Luther King Jr.'s assassination in 1968, federalized National Guard and army regulars relied instead on nonlethal tear gas to control rioters with fewer fatalities. Some military insiders feared an increased oversensitivity to lethal force, but improved outcomes pointed to the success of less aggressive tactics.

Antiwar Movement

Throughout the 1960s, the military response to civil disorder reflected frustrating setbacks but also

significant improvements in dealing with urban riots and the emergence of the antiwar movement. In 1967, more than 20,000 antiwar protestors marched on the Pentagon near Washington, D.C., in one of the largest protests since King's 1964 March on Washington. The military's anticipation and planning succeeded in controlling a minority of rowdy protestors, while the majority protested peacefully. Despite criticisms of soldiers' excessive use of rifle butts and clubs, their sparing use of force sharply contrasted the experiences of New Jersey and Detroit earlier in the year. These and other protests led the Pentagon to form its own Pentagon Police force in 1971 as worries mounted over the safety of Defense Department personnel.

One year later, in August 1968, the military again prepared for a long-awaited confrontation in Chicago during the Democratic National Convention. Military officials worried about large turnouts, but as expectations shrank, the military, partly at the behest of President Lyndon B. Johnson, decided against a troop presence. Throughout the convention, police and Illinois National Guard troops kept watch over a mostly peaceful crowd. The violent conduct of the Chicago Police earned marked criticism and signified the only reason military planners considered troop intervention for the protection of protestors from the police. Surprisingly, public opinion polls revealed that a large portion of the general public felt the response fell short of what protesters deserved. Nevertheless, the only federal military personnel in Chicago that summer were intelligence and radio surveillance units, later attacked over the legality of surveilling citizen protests.

The darkest day of military intervention in the antiwar movement occurred in 1970 on the campus of Kent State University when National Guardsmen fired on students protesting the invasion of Cambodia. Shaken by rock throwing, Ohio National Guard troops suddenly opened fire and killed four and injured nine student protesters. The event became an enormous embarrassment for the National Guard and an impetus for improvements in training as well as increased protests on campuses. As the war neared its end, protestors gathered for what became the last large protest of the era on May Day in 1971. Nearly 100,000 protestors gathered in Washington, D.C., with limited oversight by military personnel, who were only needed to distribute water on the exceptionally hot day.

Changing Face of Civil Disorder

In the years after the Vietnam War, the military enjoyed a decreasing role in civil disorder as police took the lead. Only the 1992 riots in Los Angeles, following the acquittal of four police officers indicted in the roadside beating of Rodney King, required the mobilization of the National Guard and federal forces. After President George H. W. Bush approved the intervention, the troops supported the police, who benefited from a dramatic decrease in violence linked to their arrival.

With a decrease in riots, National Guard troops often respond to in natural disasters to provide logistics and supplies to people affected by hurricanes, floods, and droughts. The National Guard played significant roles in Hurricane Andrew in 1992 and more recently during Hurricane Katrina in 2005. During Hurricane Katrina, troops from every military branch assisted state National Guard units with search and rescue, logistics, medical, and other responsibilities throughout the Gulf states and particularly in hard-hit New Orleans, Louisiana. The Posse Comitatus Act prevented regular military forces from enforcing the law, but they regularly patrolled and supported police with their presence. Again, pervasive frustrations dating back to the 1960s surfaced as critics argued that National Guard units lacked resources and training to handle responsibilities they faced in New Orleans.

As Mexican border tensions increase, national military forces, including the National Guard, continue to support border security as well as drug interdiction missions that began in the early 1990s.

CIVIL WAR, AMERICAN

The American Civil War started on April 12, 1861, when Confederate guns under the command of General P. G. T. Beauregard opened fire on Union forces stationed in Fort Sumter, South Carolina. The war lasted 4 years with major combat ending on April 9, 1865, when the Confederate general Robert E. Lee surrendered at Appomattox Court House, Virginia. The conflict was the nation's bloodiest war with a cost of about 620,000 lives—more than all other American wars combined. In the North, more than 1 million men were in uniform at any given time during the war, while in the South, as many as 850,000 served. There were approximately 10,000 different battles in places stretching from Virginia to New Mexico on land, and from the coast of France to the Gulf of Mexico on water.

The Civil War remains an extensively studied and historically significant event. The war freed 3.5 million slaves and put to rest the question of a state's right to arbitrarily nullify federal law or secede from the Union. Some considered the Civil War to be the world's first modern war because it was the first large-scale conflict in which there was widespread use of technologies produced by the Industrial Revolution. Railroads, telegraph lines, and quick-loading rifles are but a few of the innovations used on a massive scale during the Civil War.

Causes of the War

The origins of the Civil War can be traced to the U.S. ratification of a constitution that allowed slavery to remain a legally protected institution. During the antebellum period, however, states became divided over the existence of slavery. Abolitionist sentiment in the North grew as the Second Great Awakening and remnants of the Enlightenment took hold in American society. Many Northerners saw slavery as un-Christian and cruel, while in the South, the institution was considered an economic necessity.

Nineteenth-century territorial expansion west continuously upset the balance of political power between slave and free states. The United States annexed Texas in 1845, triggering the Mexican-American War, which resulted in an additional 500,000 square miles added to the U.S. territory. The status of slavery in these lands was a concern for Northern and Southern politicians, who vied to gain a majority in Congress. Outside the political arena, citizens began to take fiery stands on either side of the debate. One man's actions demonstrated how dire and serious the slave question was. John Brown, an abolitionist settler in Kansas, killed five pro-slavery men and later led a small band of men who seized the federal armory at Harpers Ferry, Virginia, in an attempt to start a slave insurrection. Brown was caught and hanged for his crimes. His actions fueled the existing militant attitude among Southerners determined to defend slavery.

In the late 1850s, the Republican Party gained political strength in the North by promising to stop the spread of slavery into new territories, and in 1860, the party's presidential nominee, Abraham Lincoln, was elected president. Within weeks of Lincoln's election, Confederate forces fired on Fort Sumter in the Charleston harbor. Inside the fortress were 80 Union soldiers, who manned the fort despite the secession of South Carolina the previous December. Although by the time the fort was fired on, seven states had seceded, armed conflict until then had been avoided. Within 5 weeks of the firing on Sumter, four additional states left the Union.

Raising Armies and Determining Strategies

Although the United States Military Academy at West Point, New York, had been producing army officers for more than half a century, both sides lacked enough officers and needed to mobilize

massive armies of citizen-soldiers. Generally speaking, the Civil War soldier was not a professional but a volunteer or a draftee. Any experience he had was from service in local militia. Even though most Civil War soldiers were not professionals, historians have stressed the strong martial spirit and fascination with warfare that existed among much of the male population. In examining the combat motivation, historians have argued that soldiers on both sides embraced a culture of courage that stressed individual valor and viewed even the expression of fear as dishonorable.

Nevertheless, both sides would resort to conscription to fill their ranks over the course of the war. The Confederacy adopted conscription in 1862, raising approximately a fifth of the needed manpower through the draft. Conscription remained unpopular in the South both because it clashed with Confederate ideology that emphasized states' rights and because it exempted certain classes from military services, most notably plantation overseers. The federal government adopted conscription in 1863, though it failed to raise significant numbers of troops for the Union Army. The draft spawned massive dissent, including one of the worst riots in American history in New York City in July 1863.

The senior leadership of this war shared a common education based on attendance at West Point, and many had served together in the Mexican-American War. They had absorbed the lessons of the Napoleonic War as interpreted by the writings of Antoine-Henri Jomini. Initially, Union and Confederate commanders believed that the key to success (and glory) was the search for a climactic battle that would break the enemy's will to fight, as had been the defeat of a far larger Russian and Austro-Hungarian army in 1806 at Austerlitz at the hands of Napoleon.

As the winds of war grew stronger in 1861, both governments chose their military leadership. For the Union, Lieutenant General Winfield Scott was the sitting general in chief, but he was too old and overweight to command in the field. For a strategy to beat the South, Scott conceptualized the "Anaconda Plan." The plan's design was to stop all naval commerce in and out of the South by blockading southern ports and denying the Confederacy access to the Mississippi River. On land, a multiprong invasion by the Union Army would secure key southern cities of economic, political, and strategic importance.

Although ambitious, the plan's design limited casualties and did not call for the destruction of the South's infrastructure.

Confederate president Jefferson Davis, former army officer and U.S. secretary of war, acted as the South's military operational planner with Generals Robert E. Lee and Braxton Bragg acting as his advisors at different times during the war. Davis planned to carry out a mostly defensive war by blocking major Union advances and fighting offensively only when necessary or when victory would garner foreign recognition and support. The rural and agrarian South did not have the industrial capacity to produce the war materiel needed for a sustained offensive strategy. Nevertheless, the South's most celebrated general, Robert E. Lee, believed that victory could only be achieved by destroying the North's army with well-planned offensive campaigns.

Both armies throughout the war sought the climactic battle reminiscent of Napoleonic tactics. Nineteenth-century theory rested on the idea that the offense was the only way to win wars. For Confederate leaders, thrusting north into Union territory made perfect sense despite their overall defensive strategy as the goal of the war was victory, and the only way to win was to destroy the Union Army in a single, climactic battle.

The quest for a climactic battle proved elusive for commanders on both sides. Instead, the war eventually shifted to a "hard war" that included the emancipation of slaves and a war of attrition in which General Ulysses S. Grant sought to grind down Lee's army and bring war directly to the civilian population. Although much of the Civil War centered on conventional battles between opposing armies, guerrilla activity was endemic, especially in the border state of Missouri.

The Beginning of the War

The First Battle of Bull Run was the first major engagement of the war. It occurred on July 21, 1861, near Manassas Junction, Virginia. Confederate forces were massed along Bull Run creek to stop the Union advance against the Confederate capitol in Richmond, Virginia. The resultant Southern victory not only routed much of the Union Army but also vanquished the popular belief that the war would be a 90-day affair. The defeat also persuaded Lincoln to replace his field commander, Brigadier General Irvin McDowell,

with Major General George B. McClellan. After the battle, McClellan spent the next several months training and reorganizing what was named the Army of the Potomac.

In the West, Grant won a series of battles in February 1862 at Forts Henry and Donelson in northern Tennessee. The victories gave control of the Cumberland and Tennessee rivers to Federal forces and ensured that Confederate forces would have to withdraw from Kentucky where they had occupied Columbus and Bowling Green. Grant was promoted to major general. In early April, as Grant's army pushed south, Confederate generals Albert Sidney Johnston and P. G. T. Beauregard attacked him at Shiloh, Tennessee. Grant narrowly won the Battle of Shiloh, and Albert Sidney Johnston was killed. The fiercely fought 2-day battle produced such horrific

casualties that some Union commanders, including Grant and Brigadier General William T. Sherman, were convinced that a Union victory could be won only by complete military conquest.

The next month, McClellan launched an ambitious campaign that bypassed Confederate forces defending the northern approaches to Richmond. McClellan floated his 100,000-man Army of the Potomac down the Chesapeake Bay to the mouth of the Rappahannock River at Fortress Monroe, Virginia. Once there, his army marched up the James Peninsula. Lacking aggressiveness and overly cautious, McClellan stalled outside Yorktown, convinced that the Confederate opposition outnumbered his force. A month passed before the Union finally moved up the peninsula toward Richmond. In late May, at Fair Oaks and Seven Pines, just a few

miles east of Richmond, Confederate general Joseph E. Johnston attacked two Union corps who were isolated by a swollen river. The action was a draw but could have been an overwhelming Confederate victory had Joseph E. Johnston acted more decisively. Because of this, Davis replaced Joseph E. Johnston with General Robert E. Lee, who quickly attacked a tired and overly cautious McClellan. Although the Union won all the resultant battles, known as the Seven Days Battles, the Army of the Potomac slowly withdrew from the peninsula in July to reinforce the newly formed Army of Virginia under Major General John Pope. Pope was ordered to attack Richmond from the northeast and was well under way by the time McClellan arrived to assist. During this time, Lincoln also appointed Major General Henry Halleck as general in chief of the Union Army. For the Confederacy, their new savior and hero, Lee, would serve as the general in chief of the Army of Northern Virginia for the remainder of the war.

Despite the Confederate's overall defensive strategy, political and military leaders nevertheless saw the advantages of well-planned offensive campaigns. The first of these occurred after Pope's defeat at the Second Battle of Bull Run, which was fought soon after McClellan's withdrawal from the peninsula and on the same ground as the First Battle of Bull Run. Confident that a military presence would persuade Marylanders to secede, Lee invaded the North from Maryland's western border. McClellan, put back in command of Union forces after Pope's defeat, cautiously shadowed Lee as the split-up Confederate units moved toward their objective in Pennsylvania. Confederate plans were discovered when a Union soldier found Lee's orders wrapped around cigars near an old Confederate camp. Although McClellan got the plans and knew the Confederates were divided, he did not act. On discovering that his strategy was known by the Federals, Lee regrouped and established a defensive position at Sharpsburg, Maryland, along Antietam Creek. Here, McClellan finally attacked on September 17, 1862. Lee was able to defend his position because the Union attacked piecemeal. The battle was the bloodiest single day of fighting in American history. After the battle, Lee retreated to the safety of Virginia, while McClellan only cautiously watched. Lincoln, fed up with McClellan's inaction, replaced him with Major General Ambrose Burnside.

The Cause of Freedom

The Union victory at Antietam gave Lincoln the opportunity to announce his plans for emancipation, which he did on September 22, 1862. Lincoln feared that without a battlefield victory, the Emancipation Proclamation would appear to be a desperate political move and would only undermine the Union cause and open the possibility of foreign intervention. Issued on January 1, 1863, the proclamation applied only to slaves within the unoccupied Confederacy. The document, however, changed the fundamental character of the war. At the beginning of the war, Lincoln rationalized military action by appealing to the goal of preserving the Union. He saw the United States as the world's test case for democracy and refused to let the country be destroyed by a minority who objected to national policy. Many Northerners agreed with this sentiment, and in the first half of the war, many enlisted to preserve the

Union. Americans on both sides fought to preserve a structure and way of life that they had before the war. As they saw it, the war was fought to turn back the clock and restore things as they were before Fort Sumter. By the end of 1862, it was clear that this was not going to be possible. The Battles of the Peninsula and Antietam convinced the North that the South was not going to give up easily and that slavery could not continue in any shape or form if the North was going to win. The total destruction of slavery would require the defeat of the South and its armies. But the Emancipation Proclamation also served to diminish the likelihood of foreign intervention on behalf of the Confederacy. By mid-1863, fully trained and equipped Black Union regiments were being fielded. Allowing Black males to serve in the Union Army was both practical and politically

beneficial. The added manpower allowed the Union to maintain its numbers in light of ever-increasing Northern antiwar protests and draft riots. In addition to fighting, Union soldiers built roads, canals, and defensive works and pulled guard duty all over the occupied South. In light of these facts, allowing Blacks to serve made practical sense. Approximately 180,000 Black males served in the Union Army and Navy during the war.

Southern Offensives

At the same time Lee invaded Maryland, Confederate Bragg took advantage of the dispersed disposition of Union forces in the mid-South and concentrated his army in east Tennessee and invaded Kentucky. It took weeks for Union forces to react, concentrate,

and move to meet Bragg's invasion force. They did so at Perryville, Kentucky, on October 8, when both sides stumbled into each other while searching for water. Although the Confederates held the field and inflicted more casualties at battle's end, their strategic disposition forced them to abandon Kentucky and regroup in central Tennessee.

Throughout the winter of 1862–1863, Union and Confederate forces fought for control over central Tennessee and northern Virginia. South of Nashville at Murfreesboro, Tennessee, the two armies fought to a draw over nothing more than the desire to make a demonstration before year's end. In northern Virginia, Burnside attacked Lee at Fredericksburg, Virginia. Knowing McClellan had been dismissed for inaction, Burnside acted within weeks of his appointment as head of the Army of the Potomac. Burnside took the town easily enough but ordered more than a dozen failed bloody assaults against Lee's entrenched Confederates manning the heights above the town.

After Burnside's defeat at Fredericksburg, he attempted to march his army around the Confederates, only to be mired down in muddy roads. In January 1863, Major General Joseph Hooker was placed in charge, and he cleaned up and reorganized the demoralized Union Army. Hooker was aggressive and cocky, and in May, he made a bold flanking maneuver in an attempt to get behind Lee. Lee met Hooker's advance at Chancellorsville, Virginia. During the battle, Lee again broke with doctrine by dividing his smaller force and ordering Lieutenant General Thomas "Stonewall" Jackson, Lee's most trusted subordinate, to carry out an aggressive flanking maneuver around the Union right. The move worked splendidly and Jackson's troops surprised and all but routed the Union Army's right flank. Hooker, stunned by a shell early in the battle, lost his nerve and acted hesitantly throughout the engagement. Only the setting sun saved Hooker's army from total defeat as Jackson was not able to push the attack to its fullest. That night, Jackson was shot by a Confederate picket when reentering his lines after a reconnaissance. Although the South won the battle, Lee felt that he had lost his best general.

In the spring of 1863, in the West, Grant set out to secure the full length of the Mississippi River for the Union by capturing Vicksburg, Mississippi, the last Confederate city on that river. Having failed

to take Vicksburg from the North, Grant had his fleet of boats run Vicksburg's gauntlet of guns and steam downstream past the town. From the river's west bank, Grant's army moved south through a series of bayous to link up with the fleet and cross the Mississippi River 50 miles south of Vicksburg. Once on the east bank, Grant marched to attack the Confederate rail hub at Jackson, Mississippi. Once in possession of Jackson, Grant turned west and besieged Vicksburg. After more than a month, the city was finally surrendered to Grant on July 4, 1863. After hearing of Vicksburg's fall, besieged Confederates just a few miles south at Port Hudson surrendered. The victories effectively cut the Confederacy in two and secured the full length of the Mississippi for the Union.

Lee's second invasion of the North resulted in the battle at Gettysburg, Pennsylvania, the biggest ever fought in North America. Lee personally believed that a good defense often required a strong offense, and in June 1863, he again took his army north away from war-weary Virginia to seek foreign recognition with a victory on Northern soil. The Army of the Potomac, now commanded by Major General George Meade, shadowed the Confederates and kept themselves between Lee and Washington, D.C. When the two forces met, the 3-day battle was largely a series of Confederate attacks against entrenched Union defenders. In the end, the two sides suffered a combined 53,000 losses. Defeated, Lee retreated virtually unimpeded to Virginia, never again to invade the North with such a large force.

The Naval War

A crucial element of Scott's Anaconda Plan would be the implementation of a naval blockade. To this end, the Union Navy vastly increased in size to effectively seal off southern ports, and by the end of the war, the United States possessed one of the largest and technologically advanced navies in the world. Initially, the blockade would be porous, but over time it would tighten, exacerbated by the Union Army's capture of key ports along the coast and Mississippi River. Moreover, the Union Navy and Army cooperated in a number of joint operations, most notably off the Sea Islands of South Carolina, in McClellan's Peninsula Campaign, and in the seizure of key centers such as New Orleans and Mobile.

The Confederate Navy could not match the Union Navy in number of vessels but instead placed greater emphasis in commerce raiding as away to strike back at the Union war effort on the high seas. In addition, the Confederacy proved technologically innovative in developing an ironclad warship as a way to counter the numerical advantage of Union. Simultaneously, the Union Navy designed its own ironclad ship, the *Monitor*, that would meet the Confederate vessel the *Virginia* in an epic but indecisive engagement in 1862. Along with developing ironclad vessels, the Confederates successfully deployed a submarine that managed to sink a Union vessel (although the *Hunley* would be lost at sea). To further counter the blockade, the Confederate Navy deployed mines and torpedo boats. In the end, it would not be enough, and by 1864 the South would be almost totally cut off from European markets and goods.

The War of Attrition and the March to the Sea

July 1863 was a pivotal month during the war. Grant's victory at Vicksburg split the Confederacy and gave the Union unrestricted use of the Mississippi River. Union forces were then shifted to east Tennessee for an offensive thrust into Georgia. Although defeated at Chickamauga, Georgia, and besieged at Chattanooga, Tennessee, Union forces under Grant's leadership eventually pressed Confederates out of southeast Tennessee and opened Georgia to a Union offensive by year's end. In northern Virginia, Lee's army held a defensive line and reacted to Meade's attempt at a fall offensive. Meade's cautiousness with Lee caused Lincoln to once again find a new commander. In March 1864, Grant's stellar performance earned him a promotion to lieutenant general and general in chief of all Union forces. Meade remained in command of the Army of the Potomac but worked under the watch of Grant for the remainder of the war.

As early as 1862, Grant and Sherman had determined that complete military conquest was the only way to defeat the Confederacy. In the spring of 1864, the two generals put their philosophies to work. To prevent the Confederate Army from reinforcing units under Union attack, Grant and Sherman coordinated their spring offenses to kick off simultaneously.

In May, Sherman and his Army of the Tennessee moved south into Georgia. Sherman's objective

was the supply and rail hub of Atlanta. In Virginia, Grant and Lee faced each other for the first time. Grant's strategy was to maneuver in such a way that Lee was forced to fight him. This strategy was costly as the Union Army often attacked entrenched Confederates. Nevertheless, Grant was able to absorb the losses and Lee was not.

For several months, Sherman fought a series of battles in north Georgia against Joseph E. Johnston and Lieutenant General John Bell Hood before finally taking Atlanta in early September. The much needed victory helped Lincoln win reelection in 1864. At the very time Sherman moved against Georgia, Grant moved south and met Lee near the old Chancellorsville battlefield called The Wilderness. Although that engagement was a Confederate victory, Grant did what no other defeated Union commander had previously done; he moved against Lee the next day. For the next several weeks Grant fought Lee in a series of battles that produced horrific casualties for the Union. Although the Federals suffered some defeats, the pressure of constant combat forced Lee to fall back toward Richmond while sustaining casualties he could not replace. By mid-June, just 1 month after starting the movement south, Grant had pushed Lee to the outskirts of the vital rail and communications center of Petersburg, just 20 miles south of Richmond. Here, the two armies settled into a 10-month siege.

When Sherman took Atlanta, Confederate forces under Hood retreated west. Instead of pursuing, Sherman marched east for Savannah after setting ablaze military stocks and about one third of Atlanta. The Union objective was to take the war into the heart of the Confederacy by destroying supplies and attacking the South's will to fight. By December, Sherman pushed his march to the Atlantic Ocean and presented Savannah to Lincoln as a Christmas gift. In the meantime, Hood's retreating army turned north for an offensive strike into middle Tennessee. After a series of reckless attacks at Franklin in November 1864 and at Nashville in December, Union forces destroyed Hood's portion of the Army of Tennessee at the Battle of Nashville.

After rest and resupply, Sherman turned north and marched into the Carolinas to link up with Grant in Virginia. As in Georgia, Sherman burned supplies, tore up rail lines, and freed slaves. On March 19, Joseph E. Johnston, who had charge of the Army of Tennessee in North Carolina, attacked

Greensboro, North Carolina. It would be another month, however, until the last battle of the war was fought in west Texas.

Historical Interpretations

The Civil War in American memory has created a variety of historical interpretations that contribute to a vast and diverse historiography. In the decades following the war, the “lost cause” interpretation of the war took root in Southern culture. This mood was generated and perpetuated to restore Southern honor and place the fault of the war on Northern hostility. The lost cause theory elevated Lee to a god-like status and credited the birth of the Confederacy to what James McPherson called “divine principle.” The lost cause marginalized slavery and painted Northerners as aggressors against Southern sovereignty. In contrast, Northerners portrayed the war as a crusade against slavery. Early in the 20th century, Progressive historians claimed that the economic strife between the agrarian South and the industrialized North caused political friction, which led to war. By mid-century, the Revisionists school rose out of romantic notions that the South was a victim of both Northern and Southern radical factions that spread hatred and caused the war. Regardless of causation interpretation, what is clear is that the roots of the war are a combination of complex political, economic, and social issues that resulted in secession when a president was elected whose platform threatened slavery.

In addition to the discussion over how Americans remember the Civil War, historians continue to debate several major questions that synthesize tactics, campaigns, and commanders with the common soldier, nationalism, and the home front. Most notably, Bell Irvin Wiley was the first historian to look at the soldier experience in his works *Life of Johnny Reb* and *Life of Billy Yank*. Since the publication of these pivotal volumes, several historians have added significant layers onto the study of the common soldier through studying the multitude of letters and diaries left behind. Historians such as McPherson, Gerald Linderman, Earl Hess, and Reid Mitchell retrace the steps of the men in their ranks in an attempt to determine the nature of their day-to-day experience, how they were able to withstand hardship and loss, and most important, why they fought. Building on scholarship on the common soldier, scholars such as

Jason Phillips, Kenneth Noe, and Chandra Manning attempt to understand the ideological motivations such as slavery, nationalism, and masculinity that intrinsically kept men in their ranks. Other scholars, such as Hess and Linderman, place the common soldier within the context of the higher command and campaign strategy to understand how unit cohesion, morale, and courage motivated soldiers to withstand combat.

Initially, a major scholarly debate centered on why the North was able to defeat the South. While some synthesis has been reached, the growing body of literature on the commanders, campaign strategy, and tactical challenges continues to intrigue historians. For example, Joseph Glatthaar looks at leadership within the Army of Northern Virginia and its subsequent effects on the troops, Hess investigates trench warfare during the Petersburg Campaign, and Gary Gallagher adds an intricate assessment of the Union high command to couple his previous work on the Confederate leadership. Similarly, scholars retrace how the Civil War shaped modern military training in the late 19th century. For example, Carol Reardon demonstrates how Civil War tactics, technology, and battlefields served as training for the American military during the Progressive Era. Reardon’s study argues that the Civil War battlefields served as the training grounds, while testimony and experiences of veterans served as the push for modern military institutes, protocol, and education that stands today.

As historians continue to debate the outcome of the war, several scholars attempt to answer these traditional questions from new angles such as non-traditional warfare, the home front, and dissent. A group of scholars, in particular, Daniel Sutherland, move beyond the Eastern and Western theaters in an attempt to investigate guerrilla warfare and its effect on the attention, resources, and concern of both the Lincoln and Jefferson administrations. In addition, scholars such as Nina Silber, Matthew Gallman, Jennifer Weber, Aaron Sheehan-Dean, Stephen Ash, and Stephanie McCurry, among others, argue that the politics, conditions, and occupied areas on the home front were directly correlated to the armies and the soldiers who fought. This scholarship argues that there was a direct correlation between the participants in the political administration, home front, and battlefield. Therefore, as historians continue to ask the traditional questions such as whether or not the conflict was inevitable, why the North won,

and the nature of the common soldier experience, the scholarship on the Civil War demonstrates how answers to these questions are seemingly endless because the depth and complexity of the effects of the conflict on the participants continue to provoke inquiry by successive generations.

CIVIL-MILITARY RELATIONS

Civil-military relations is the term used to describe the relationship between civil society and the military. Most often, the term refers to the relationship between civilian leaders of the state and the leaders of the military organizations created to defend it. In the broadest sense, however, civil-military relations include political, economic, and cultural relationships between civil society and the military at all levels. Military recruitment, civilian attitudes toward the military, and the economic effects of military procurement policies are examples of the wide range of relationships encompassed by the term.

Major Issues in Civil-Military Relations

A central concern in the study of civil-military relations is how civilian leaders establish and maintain

authority over the military when the military possesses the coercive power to take control of the state. With civilian control of the state as the normative ideal, students of civil-military relations examine the governmental structures, political processes, and cultural practices that affect the likelihood of the military overthrowing a civilian government or imposing its will on civilian authorities in other ways. In the United States, the possibility of a military takeover of the government has remained remote for a number of reasons, including the Constitution's clear designation of civilian control, the competing centers of power within the government, and the acceptance of civilian supremacy as part of the officer corps' professional training.

The study of civil-military relations also considers the extent to which the military obeys the commands of its civilian leaders. The military can undermine civilian control by refusing to comply with orders from civilian superiors or by failing to follow those orders fully and promptly. The political scientist Peter Feaver (2003) uses agency theory to describe ways in which the military, as the agent, does or does not carry out the policies of civilian leaders. When the military disfavors policies, Feaver says, it may "shirk" its responsibility for implementing them through delay or other means.

Another major issue in the field of civil-military relations involves the appropriate roles of civilian and military leaders in making decisions related to the military. Even nations with well-established traditions of civilian supremacy over the military have found it difficult to determine which decisions should fall to civilian leaders and which to the military. The issue often arises during deliberations over whether or not to use military force in pursuit of national policies and, once the decision to use force is made, how best to use it to achieve the desired end. In his influential work on civil-military relations, *The Soldier and the State* (1957), the political scientist Samuel Huntington argued that, while the military should defer to civilian authority on questions of broad policy, civilians should give the military the autonomy to conduct operations as it sees fit. He said that civilian leaders lack the expertise to make decisions at the operational level, and their attempts to intervene usually undercut the military's effectiveness. Huntington's critics contend, on the other hand, that no clear line exists to separate political decisions from the purely military. Civilian

leaders must at times make decisions about military operations, they say, because military actions at all levels can have political consequences.

Huntington and other scholars of civil-military relations have also examined the issue of the military's role in the political process. Huntington asserted that, just as civilian leaders should avoid involvement in the affairs of the military, military leaders should refrain from political activity. Indeed, in most modern democracies, the expectation is that the military as a whole should be politically neutral and that members of the military should abstain from political actions such as running for office or endorsing candidates. In the United States, the ideal of political neutrality, reflected both in law and in notions of military professionalism, has discouraged the direct involvement of military personnel in partisan politics. Still, the military has found other ways to exert influence in the political sphere. Leaks to the news media, the cultivation of key allies in Congress and other areas of the civilian government, and the politically astute distribution of procurement funds are examples of the methods that military leaders have used to steer policies in the directions they favored.

Civil-Military Relations in U.S. History

American conceptions of civil-military relations took shape during the colonial period. Most colonists shared the view of the British Whig party that the military—standing armies in particular—represented a threat to political liberties. The colonists' suspicion of standing armies contributed to the widening breach between the colonies and the mother country when the British government sent regular troops to Massachusetts to quell political protest in the 1760s and 1770s. The newly formed United States established a standing army of its own once the revolution was under way, but the Continental Congress kept the army under close supervision. George Washington, commander of the Continental Army, strengthened the tradition of civilian supremacy through his scrupulous respect for congressional authority during the war with Britain and his opposition to the so-called Newburgh Conspiracy of 1783, in which Continental Army officers contemplated open defiance of Congress in response to its failure to pay them.

The Constitution made the president commander in chief of the military, but the framers, wary of

having the military become an instrument of executive power, gave Congress control over its budget. The Constitution also reduced the concentration of military power by providing for state militias as well as national armed forces. For the military, the Constitution's system of divided civilian control meant that it sometimes received mixed or even contradictory signals about policies from civilian leaders.

Through much of the 19th century, the American military, small in size and geographically scattered, had little influence within the political system. The beginning of the Civil War in 1861 produced a dramatic expansion of the military's size and offered the opportunity for an increase in its political influence as well. President Abraham Lincoln, however, kept military affairs firmly under civilian control. Lincoln was an active commander in chief who participated in the formulation of strategy, questioned and prodded his sometimes slow-moving generals, and at times even directed troop movements. Generals such as George B. McClellan complained that the assertiveness of Lincoln and other civilian leaders interfered with their ability to conduct the war, but the military generally accepted the idea of civilian oversight and command. The period of Reconstruction that followed the Civil War entangled the military in domestic politics in unprecedented ways. The Congressional Reconstruction Act of 1867 divided the defeated southern states into military districts commanded by army generals who became responsible for supervising elections, overseeing the formation of new state governments, and protecting the civil rights of the recently freed slaves.

Following its foray into the heated politics of Reconstruction, the military struggled to avoid a return to the status it had held before the Civil War—poorly funded and politically inconsequential. The rise of the United States as a world power, however, meant new responsibilities and increased appropriations for the military. The desire of civilian leaders to enhance the nation's role on the international stage led to an expansion of the navy beginning in the 1880s, and the war with Spain in 1898 and the acquisition of overseas colonies that resulted from the American victory brought a substantial increase in the size of the army.

The nation's new global prominence led to involvement in two World Wars in the first half of the 20th century. In both conflicts, civilian and

military leaders worked reasonably well together, with civilian officials setting the broad strategic goals and the military making decisions at the operational level. The relations were not completely harmonious, however, and disagreements over policy arose between civilian and military leaders in both wars. President Woodrow Wilson frustrated many in the military during World War I, for instance, by ordering, against the recommendations of his top commanders, the intervention of U.S. forces in the Russian civil war in 1918. In World War II, President Franklin D. Roosevelt disregarded the advice of General George C. Marshall, the highly respected army chief of staff, when he ruled out an Allied invasion of France in 1943. Still, in both wars, military leaders recognized the authority of the presidents to decide such matters, largely kept their disputes with civilian leaders from the public eye, and worked to implement policies established by their civilian superiors.

The end of World War II in 1945 found the U.S. military in a relatively strong position. Its success in the war, combined with the need for a large peacetime military created by the Cold War with the Soviet Union, elevated its prestige and influence. Although the military generally continued its practice of deferring to civilian authority, military leaders challenged civilian leaders on a number of occasions in the early Cold War period. During the administration of President Harry Truman, internal battles between the navy and the air force over funding and their respective roles in U.S. wartime strategy went public in the so-called Revolt of the Admirals in 1949. The open criticism of the administration's defense policies by high-ranking naval officers led General Omar Bradley, chairman of the Joint Chiefs of Staff, to describe the officers' actions as a "rebellion" against civilian control. President Dwight Eisenhower, himself a former general, faced a less public but equally resolute resistance against his strategic policy of "massive retaliation" from a number of high-ranking army officers in the 1950s.

The most notable case of military defiance of civilian authority occurred in 1951, when General Douglas MacArthur, commander of UN forces in the Korean War, openly criticized the Truman administration for its refusal to expand the war by bombing targets in China. MacArthur's public critique of the administration's strategy of limited war prompted Truman to relieve the general of command for

insubordination. The firing of an extremely popular general by an unpopular president outraged many Americans. Yet even among those who doubted the wisdom of Truman's action, few questioned his authority to remove MacArthur, and most scholars of civil-military relations consider the episode a significant demonstration of the strength of civilian control.

Another land war in Asia, the Vietnam War of the 1960s, also generated disagreement between civilian and military leaders and added to the debate over the appropriate roles of military and civilian leaders. During the conflict, many in the military resented what they perceived as the overly restrictive management of military operations by President Lyndon B. Johnson and civilian officials of his administration. Civilian interference, said critics of the Johnson administration, impeded the American war effort. Johnson's supporters, on the other hand, defended the president for placing limits on military operations to prevent the war from possibly escalating into a broader conflict. The ultimate failure of American efforts to prevent the takeover of South Vietnam by communist North Vietnam contributed to the intensity of the controversy over the Johnson administration's relations with the military.

The American experience in Vietnam caused many members of the military to question the wisdom of interventions in foreign conflicts by U.S. forces, especially when those interventions lacked clear objectives. This skepticism affected the military's response to the numerous peacekeeping missions that civilian leaders called on it to perform in the last decades of the 20th century. The Joint Chiefs of Staff, for example, opposed the decision of President Ronald Reagan to send a contingent of U.S. Marines to Lebanon as part of an international peacekeeping force in 1982. The failure of that mission—the troops were unable to restore peace to the area and hundreds of marines died when terrorists bombed their barracks—reinforced the military's doubts about such interventions, as did the failure of the mission to provide humanitarian aid in Somalia in the early 1990s. In contrast, many in the military pointed to the U.S. invasion of Panama to overthrow the dictator Manuel Noriega in 1989 and the U.S. response to the Iraqi invasion of Kuwait in Operation Desert Storm in 1991 as models of effective intervention and harmonious civil-military relations. In both cases, President George H. W. Bush

largely deferred to the judgment of his military advisors on the size of the forces involved and the conduct of the operations.

In 1992, the growing debate in the United States over whether the country should use military force to stop the bloodshed caused by "ethnic cleansing" campaigns in Bosnia and Herzegovina led General Colin Powell, chairman of the Joint Chiefs of Staff, to articulate a set of guidelines for civilian policymakers to consider before authorizing an armed intervention. In a published opinion piece, Powell argued that the United States should not intervene unless the mission had well-defined goals, strong public support, and a commitment from civilian leaders to use decisive levels of force to achieve victory. Powell's action caused controversy. Some experts on civil-military relations contended that he had undermined the authority of civilian leaders to decide on questions of policy by offering his advice through a public forum rather than through official channels and by seeming to insist on standards that a proposed intervention must meet before military leaders would endorse it.

The election of Bill Clinton as president in 1992 initiated a period of increased conflict between civil and military leaders. Clinton's personal history—he had avoided military service during the Vietnam War through student deferments and had taken part in antiwar demonstrations—as well as his perceived disregard for the armed forces made some in the military reluctant to accept him as commander in chief. The opposition of many military leaders to the administration's policies in the interventions in Haiti in 1994 and Kosovo in 1999 added to the tension. The greatest source of discord, however, was the Clinton administration's efforts in 1993 to overturn the ban on gays serving in the military. Military leaders, including members of the Joint Chiefs of Staff, publicly criticized the proposed change in policy and worked with allies in Congress to block the move. The dispute led to the passage of compromise legislation—the "Don't Ask, Don't Tell" bill—which continued the prohibition on gays serving in the military but prevented the military from inquiring about the sexual orientation of military personnel.

The terrorist attacks of September 11, 2001, resulted in increased popular support for the armed forces and an even greater reliance on the military as an instrument of U.S. policy. The U.S. invasions

of Afghanistan in 2001 and Iraq in 2003, followed in both cases by long-running counterinsurgency campaigns, focused renewed attention on the appropriate roles of civilian and military leaders in conducting military operations. Many in the military criticized civilian officials of the administration of President George W. Bush for involving themselves in the details of the operations rather than merely setting the strategic goals and letting the military take care of planning and executing the campaign. The criticism fell in particular on Secretary of Defense Donald Rumsfeld, who insisted on a rapid reduction of U.S. troop strength in Iraq after the fall of Saddam Hussein's regime despite the advice of Army Chief of Staff Eric Shinseki that far larger numbers of troops would be necessary to maintain order in the country. Regardless of the dissatisfaction in the military with many aspects of civilian leadership, civilian control of the military remained strong. A striking reminder of this occurred in 2010, when President Barack Obama relieved General Stanley McChrystal as commander of U.S. forces in Afghanistan for disparaging remarks that the general and members of his staff had made about members of the Obama administration to a journalist.

Current Issues in Civil-Military Relations

The principle of civilian control of the military is well established in the United States in law and tradition, but what civilian control means in practice will likely remain a source of contention. As the disputes between military and civilian leaders in both the Vietnam and Iraq wars reveal, no consensus has developed over what their respective roles should be in making decisions about military operations once civilian authorities choose to use force in pursuit of national interests. The role of the military in the political system is also likely to remain controversial. Two developments of recent years promise to cause disagreement as well. One is the increasing tendency of Western nations to conduct military operations under the command of transnational organizations such as the United Nations and the North Atlantic Treaty Organization, a practice that raises questions about the extent to which the military's obligation to obey civilian authority extends to civilian leaders of foreign nations. Another is the growing reliance of the U.S. armed forces on civilian contractors to carry out military tasks, a practice that raises questions

about the extent to which contractors should adhere to the same standards as the military in obeying civilian authorities and avoiding political activity.

CLASSIFICATION SECURITY

Classification security is a prescribed uniform system that establishes standards for the protection of national security information (NSI). A national classification security system protects defense- and foreign relations-related information obtained during our interactions with other nations as directed by the president. The president, using constitutional

authority, administers the protection of classified information via executive orders (EO). Since 1940, various presidents have established classified security programs for the protection of NSI. The unauthorized release of NSI to the public would cause varying degrees of damage to national interests. The current EO 13526 provides the authority and guidance for defining, protecting, marking, and declassifying NSI throughout the life cycle of the records.

Since the first EO dealing with NSI (EO 8381 issued in 1940), the classification security system has reflected contemporary national security concerns and political environments. The most recent iteration of the EO dealing with NSI (EO 13526 issued on December 29, 2009) inherited most of the characteristics that originated with President Bill Clinton's groundbreaking EO 12958, further institutionalized by President George W. Bush in 2003, along with a few new items from the current administration of President Barak Obama. The EO places controls on the marking levels and the longevity of classification decisions. The EO also defines what information meets the three classification levels: (1) confidential, (2) secret, and (3) top secret. It is also important to note what the order does not cover: Specifically excluded from the classification system defined by the NSI EO is information covered by the Atomic Energy Act of 1954 dealing with the design, production, and use of nuclear weapons and special nuclear material. This entry describes the procedures and standards for classifying information by the U.S. federal government.

Original Classification Authority

Only executive branch officials may classify information, and they must be designated in writing by the president of the United States. These officials are known as original classification authorities (OCAs). The OCAs are responsible for applying the guidance provided in the EO within their particular agencies. As per the EO, the number of OCAs is limited to keep a measure of control on the production of classified material within the federal government. In addition, OCAs must be able to positively identify the damage to national security if the records they are classifying are inadvertently released.

The OCAs must attend annual mandatory training to understand their responsibilities for classifying information. The training emphasizes such issues

as overclassification, classification safeguards, and records declassification. An OCA's authority can be suspended if the OCA does not attend the annual training.

OCAs are just that—original classification authorities. Other executive branch officials can classify documents, but only when those documents contain information derived from other classified records.

Standards for Eligible Categories

For information to be classified, it must be owned by, produced by or for, or under the control of the U.S. government. Under the current order, the kinds of information eligible for classification fit within the following categories:

1. Military plans, weapons, and military operations
2. Foreign government information—information that originated with another country
3. Intelligence activities (including covert action), intelligence sources and methods, or cryptological systems
4. Foreign relations or foreign activities of the United States, including confidential sources
5. Scientific, technological, or economic matters relating to national security
6. Nuclear information not covered by the Atomic Energy Act of 1954, primarily information dealing with programs that protect and safeguard special nuclear material and nuclear facilities
7. Infrastructure projects, installation plans, and their vulnerabilities or capabilities related to national security
8. The development, production, or use of weapons of mass destruction

There are kinds of information specifically prohibited from security classification. The classification system cannot be used to conceal violations of the law, inefficiencies by persons or organizations, or administrative errors. The system cannot be used to conceal embarrassment to a person or an agency. Security classifications may not be used by contractors or inventors to restrain competition or to prevent or delay the release of information that does not require protection in the interest of national security.

Classification Levels

The three levels of classified information and their definitions are as follows:

1. *Top secret*: Release of information classified at this level can cause exceptionally grave damage to national security.
2. *Secret*: Release of information classified at this level can cause serious damage to national security.
3. *Confidential*: Release of information classified at this level can cause damage to national security.

While there may be other markings applied to documents in addition to the above-mentioned terms, no other terms or markings are authorized for use in identifying classified information.

OCA should apply the lowest level of classification when in doubt.

Duration of Classification

There is no connection between duration and level of classified information. The duration is a date or event less than 10 years, 10 through 25 years, or up to 25 years. All information under the order will be automatically declassified at 25 years unless the originating agency requests a duration longer than 25 years because the information still meets the original standard for classification under the order. The regulation allows information to be protected beyond 25 years without a need to exempt at 25 years as required by the order for information that would reveal a human intelligence source or key weapons design.

Access to Classified Information

There is always a necessary tension between the rights of the government to protect sensitive information from the public and the rights of the public to know how its government conducts business in the name of its citizenry. Interwoven within the U.S. classification system is the concept that an informed citizenry has the right to make the request for mandatory review for classified NSI on one side and the concept that all information is subject to the loss of sensitivities with the passage of time and should be declassified and publicly disclosed when the standards for protection are no longer warranted under the EO. The order clearly states that “information shall be

declassified when it no longer meets the standards for Classification.” The intent or concept is that information will be declassified when it is determined by the OCA that the release of the information will no longer cause damage to national security. In essence, no information may remain classified indefinitely.

In some cases, our government has declassified information citing that the public interest outweighed the continued protection under the order. The mandatory review provisions under the order allow the public to request the executive branch to review classified information for declassification and public access. The government has the right to acknowledge the request and review but also has the right not to confirm whether the documents or information exists. OCAs should always maintain a high standard for classification and allow for the release of the information in a timely and efficient manner and only protect that information the release or public disclosure of which would cause damage to the national security of the United States.

Security Classification Guides

Every executive branch agency or department with OCAs must also develop classification guides that identify the specific kind of information to be classified by the OCA as well as the appropriate level of classification. Classification guides must be approved by an official who has program or supervisory responsibility over the information or by the senior official as defined in the EO. The system requires that the guide be maintained and updated in a timely manner for the consistent protection of classified information. Classification guides can only classify information for 25 years, and except for human intelligence sources and key weapons designs, information cannot exceed the duration of 25 years as stipulated under the provisions of the order. Classification guides can and should be revised during the federal records life cycle and incorporated into a declassification guide for use in the protection of the information.

Once the OCA determines the decision on the classification level based on potential damage to national security and duration of the information, the information must be codified in a guide so that it can be used, internally and externally, by other government agencies. In using classified information, a government employee has two sources of information for classifying national security-related information. The use of a classification guide will indicate

all necessary instructions for markings, durations, and downgrading and declassification. The other authoritative method for use by an employee is the derivative classification by using source documents, materials, memos, and reports that must respect all of the original markings, duration, downgrading, and declassification instructions.

CLAUSEWITZ, CARL VON

Carl Philipp Gottfried von Clausewitz (1780–1831) was a Prussian army officer and military educator, historian, and theorist. Clausewitz was born on June 1, 1780, the fifth of six children of a Prussian tax official, Friedrich Gabriel Clausewitz, who had served as an army officer during the Seven Years' War. Although Clausewitz's father claimed aristocratic status (i.e., the right to use the term *von* before his surname), official recognition of the family's membership in the nobility did not occur until 1827. Clausewitz's two older brothers, Friedrich and Wilhelm, enjoyed distinguished army careers. In 1810, Clausewitz married Marie von Brühl, the daughter of a count who had served as military tutor to the Prussian crown prince, the future King Frederick William III, Clausewitz's sovereign. Clausewitz died of cholera in Breslau on November 16, 1831. A prolific writer, Clausewitz's collected works come to 10 volumes, of which the first 3 constitute his magnum opus, *Vom Kriege* (*On War*). The remaining 7 volumes are devoted to histories of military campaigns. This entry discusses the life of Clausewitz and examines his multivolume book on military strategy, *On War*.

Biographical Overview

Clausewitz joined the Prussian army as a lance corporal in the spring of 1792. He was promoted to

ensign in 1793, second lieutenant in 1795, first lieutenant in 1804, captain in 1809, and major in 1810. In 1812, he resigned his commission in reaction to his king's decision to support the French invasion of Russia, a step that he considered incompatible with Prussia's national interest and honor. Clausewitz then entered the Russian army as a first lieutenant, becoming a colonel by 1813. Prussia changed sides in 1813. Clausewitz subsequently rejoined the Prussian army in 1814 with the rank of colonel. In 1818, he became a major general. Clausewitz attended the Berlin Institute for Young Officers from 1801 to 1804, graduating at the top of his class, and was a member of the Military Society, a discussion group of progressive officers, from 1802 to 1805. During this period, he earned the favor of Gerhard von Scharnhorst, Prussia's leading military reformer, whose preference for history over theory, and belief in the importance of educating military leadership, heavily influenced Clausewitz's intellectual development. Scharnhorst's patronage also advanced Clausewitz's military career.

Clausewitz gained firsthand experience of major armed conflict in the wars of the French Revolution and Empire (1792–1815). He participated in serious fighting in campaigns against the French in 1793 and 1794. Clausewitz was subsequently involved in a number of great engagements. He fought at the Battle of Auerstädt in 1806, where his battalion suffered heavy casualties and ultimately was surrounded and forced to surrender. Clausewitz was attached to the Russian cavalry at the Battle of Borodino (1812). He took part in the pursuit and destruction of the French army in the winter of 1812–1813, in the course of which he witnessed the infamous slaughter of French stragglers at the Berezina River (November 27–28, 1812). Clausewitz served as an officer of the Russian army attached to the Prussian army at the Battles of Lützen (May 2, 1813) and Bautzen (May 20–21, 1813). In the former action, though nominally a staff officer, he led a cavalry charge and was wounded. Clausewitz was the chief of staff to a corps commander at the Battles of Ligny (June 16, 1815) and Wavre (June 18, 1815), which were part of the Waterloo campaign.

Clausewitz was connected in manifold ways to the political and military elite of Prussia and Russia. Clausewitz's relationship with Marie von Brühl, a

member of the Prussian royal court, began in 1802. From 1803 to 1809, he served as aide-de-camp to Prince August (son of Prince Ferdinand, who was the brother of Frederick the Great and of Prince Augustus William, the latter the grandfather of King Frederick William III). From 1808 to 1812, Clausewitz served unofficially and officially as an aide to Scharnhorst, who led the military reform effort following the catastrophic defeat of Prussia by France in 1806, and who for a time was chief of the general staff and de facto head of the Ministry of War. In 1810, Clausewitz was assigned to teach at the General War School and appointed military tutor to the crown prince. Clausewitz discussed matters of state and military affairs with King Frederick William III before and after his resignation from the army in 1812. While in the Russian army, Clausewitz was closely associated with the high command and on occasion advised Tsar Alexander. He played an important role in the negotiation of the Convention of Tauroggen in December 1812, which involved General Johann David Ludwig Yorck, commander of the Prussian auxiliary corps that supported the French invasion of Russia. In 1813, Clausewitz drafted Yorck's scheme to expand the Prussian army with reservists and militia. This was followed by a resumption of his assistance to Scharnhorst until the latter's death after the Battle of Lützen. In 1813 and 1814, Clausewitz was chief of staff to the Russian general Count Walmoden, commander of the Russo-German Legion. In 1815 and 1816, Clausewitz was chief of staff to Augustus Wilhelm von Gneisenau, commander of the Army of the Rhine from 1815 to 1816. From 1818 until 1830, Clausewitz was administrative head of the General War School. In 1830, he was appointed a member of the First and later Second Artillery Inspection Departments and also to membership in the Supervising Commission for Military, Scientific and Technical Subjects. In 1831, Clausewitz was made chief of staff to Gneisenau, commander of the Prussian Army of the East.

On War

Clausewitz studied the history of the campaigns he had been in, as well as others in which he had not, writing lengthy and detailed historical accounts. His experience, and rigorous reflection on experience

and history, provided the foundation for his most famous work, the treatise *On War*. Clausewitz's widow published the manuscript posthumously in 1832. Though unfinished, its main arguments are discernable. Clausewitz's practical objective in writing *On War* was to address the threat posed to Prussia's national existence by a resurgent revolutionary France in the post-Napoleonic era. Clausewitz attributed Prussia's near destruction in the Napoleonic wars to the inexperience of its military and political leadership and the failure of the Prussian government to choose a course of resistance to the French following the defeat of the army. He thus conceived of a radically different approach to military education that was meant to better prepare inexperienced military and political leaders for decision making in war under difficult circumstances and argued in favor of protraction of hostilities by a defender even after catastrophic military setback.

Clausewitz's educational argument is that a properly formulated approach to the study of war could significantly improve the ability of military and political leaders to make sound decisions. He was convinced that proper study was a matter of replicating the decision-making experience of successful commanders in chief of the past. Clausewitz thus called for the reenactment of historical cases of strategic decision making, followed by reflection on the experience of reenactment. Clausewitz was convinced that a great deal of importance that affected command decision is never recorded. For this reason, he argued, reenactment had to be based on a combination of verifiable historical fact and factors whose existence and effects had to be surmised. *Surmise* is to be informed by propositions about the nature of war, which had been derived from observation of actual decision making in war that had been codified into theory. Clausewitz called the process of reenactment and reflecting on reenactment "critical analysis," and he believed that this activity could enhance the intuitive faculties that are the source of effective military and political judgment. Critical analysis did so by focusing attention on why decision making is difficult rather than whether acts of decision are right or wrong.

Clausewitz's second major argument is that defense is a stronger form of war than offense. Clausewitz was convinced that a defender with the determination to resist could protract hostilities, and

by so doing, he could exhaust even a greatly superior invader. He argued that such a process of attrition would either set the stage for successful counter-attack by the defender or discourage the attacker, which would then because of internal dissension seek terms short of its original objective. For Clausewitz, therefore, the fundamental strategic issue is not, as the Swiss military theorist Antoine-Henri Jomini had maintained, concentration of force, but rather the political will to carry on the fight. Clausewitz's thinking about these matters is embodied in three related propositions: (1) war is an extension of politics by other means, (2) politics is a matter of domestic as well as foreign affairs, and (3) politics affects the attacker more than the defender. In the event of the destruction of the defender army by an attacker bent on the destruction of the national existence of the defender, Clausewitz calls for resort by the defender to action by armed civilians through what was called "people's war"—that is to say, guerrilla war.

Clausewitz does not believe that any theoretical formulation, including his own theoretical statements on the relative strengths of the defense and attack, can prescribe the actual conduct of war. But this does not rule out the use of theoretical propositions to set the terms of thinking about particular aspects of a strategic problem. Theory accomplishes this by identifying the nature of things in war. By so doing, it pushes deliberation in directions that it might otherwise not have gone, raising questions rather than providing answers. The purpose of such a process is to prevent bad intellectual habits—such as maintaining belief in the decisive strategic significance of concentration of force—from determining strategic courses of action.

On War consists of eight books, the first seven of which are concerned primarily with the direction of warfighting by the commander in chief. Books 1 and 2, which constitute a general introduction, outline Clausewitz's two main arguments. Books 3 through 5 are concerned with what Clausewitz calls the elements of war, which are strategy, tactics, and the operative characteristics of armies; in these sections, Clausewitz provides theoretical instructions for the surmise required to augment verifiable historical facts. Books 6 and 7 are about what Clausewitz calls the parts of war, which are defense and attack; in these sections, he provides a detailed exposition of his contention that the defense is a stronger form of war than offense. In Book 8, Clausewitz addresses

the problem of war planning—that is, he discusses the nature of political and military intellectual acts that necessarily precede the direction of warfighting by the commander in chief. In this final book, Clausewitz resorts to prescriptive theoretical instruments (e.g., "center of gravity"), because he believed that war planning could be addressed productively by finite and fixed propositions in a manner that he did not believe to be the case with war proper—that is, the direction of warfighting.

Clausewitz maintained that his approach to studying supreme command and views on defense and attack constitute a scientific theory—that is, a method based on accurate observation of real phenomena—of fighting between nation-states that is valid for all levels of war from low to high intensity. He also believed that the ideas put forward in *On War* invalidate all conventional general theories of war—that is, theories of war that describe the dynamics of war with comprehensive prescriptive intent. *On War* is almost universally regarded as the most important study of its subject, but disagreement about the identity and meaning of its major and secondary arguments is widespread. This is the case because Clausewitz's approach to the study of armed conflict is novel, difficult, and complex, and thus it is prone to being misconstrued by inattentive or incomplete engagement by readers. For these reasons, the full force of *On War*'s major arguments has yet to be felt.

CLOSE AIR SUPPORT

Close air support (CAS) refers to actions undertaken by aircraft against hostile forces in close proximity to friendly ground units. This requires integration of air missions with ground forces through the use of observers or coordinators to confirm targets and ensure that attacks do not threaten friendly forces. This entry describes the evolution of CAS aircraft and operations from World War I to the present.

History: World War I to Operation Iraqi Freedom

Although the noted theorist Giulio Douhet promoted the development of aircraft for strategic bombing as early as 1921 in *Command of the Air*, physical limitations of range and payload during the first decades of the age of flight kept aircraft close to the front lines. The outbreak of World War I triggered dramatic innovation in aeronautical technology and tactics, and both sides eventually produced specialized airframes to meet the requirements of observation, air-to-air bombing, and ground attack missions. One of the most famous CAS aircraft of World War I was the German Albatros J.I, which featured armor steel plating to protect the crew while strafing trenches in direct support of the infiltration tactics of *Sturmtruppen* companies. Specialized armor would become a common characteristic of CAS aircraft, but unfortunately so would fratricide, from strafing the wrong troops, which highlights the importance of intimate cooperation between ground and air forces regardless of airframe or operation. Communication was fairly limited due to the rudimentary nature of radio at the time, so aviators generally relied on flags, smoke, and the relatively stagnant trench lines to distinguish friend from foe.

Many limitations of combined arms combat were dissolved in 1937 by Hanz Guderian with the

advent of Blitzkrieg warfare and the introduction of the iconic Junker Ju 87 Stuka. Although the Stuka would reveal its weaknesses as a medium bomber in the Battle of Britain, as a CAS platform, it was exemplary. However, despite its murderous accuracy and terrorizing howl, the true source of Nazi success in overrunning Europe was the constant radio contact that the Luftwaffe maintained with advancing Panzer divisions. This technique was mirrored later in the war by Major General Elwood "Pete" Quesada, who pioneered air-ground warfare in North Africa and perfected it with General Omar Bradley in Europe. He added the use of the radar to direct fighter-bombers and made pilots ride in tanks as forward air controllers for "armored column cover" missions. Notwithstanding precautions such as distinctive markings on ground and air vehicles and ad hoc coordination measures like the "no bomb line," the lack of specific CAS doctrine led to significant fratricide incidents during World War II.

Technical and doctrinal innovations during World War II should have solidified the role of tactical attack aircraft in support of ground maneuver, but they were nearly subsumed by the invention of the atomic bomb and the birth of Strategic Air Command. The U.S. Marines maintained the combined arms tradition throughout the 1950s, but in spite of promises to continue support for the U.S. Army with the establishment of Tactical Air Command, the U.S. Air Force continued to pursue the holy grail of decisive "strategic" air power. At the start of the Korean War, the air force was so focused on strategic bombing that it considered air strikes anywhere within artillery range of friendly units to be CAS, while the marines defined it as air strikes within 50 to 200 yards of friendly troops, delivered within 15 minutes of request. Therefore, General Douglas MacArthur relied almost exclusively on the marines for CAS until the air force reluctantly initiated the Air Liaison Officer program and reintroduced forward air controllers to aid ground-based tactical air control parties.

During the Vietnam War, until the highly capable OV-10 Bronco was produced and then supplemented by the F-100 Super Sabre and F-4 Phantom, jets were flying fast forward air controller missions in areas where the surface-to-air threat became too great. Guided air-to-surface weapons, like the laser-guided Paveway bomb, also entered the arsenal at this time, and though the most well-known

use for these weapons was on interdiction targets like the Thanh Hoa Bridge, they were well suited for CAS where precision guidance was desired. Despite advances in communications technology, including the introduction of Identification Friend or Foe, night vision aids, and computerized targeting on radar systems, CAS aircraft were not impervious to poor coordination at the execution level, though standardized terminology and procedures such as the nine-line standardized format for passing targeting information to CAS platforms dramatically improved results.

Another major improvement in doctrine was the creation of fire support coordination measures such as no-fire areas and the fire support coordination line (FSCL). Fire support coordination measures improved understanding of the necessary cooperation between ground and air forces; however, many of these linear designations lost their meaning in the close counterinsurgency fights in South Vietnam, and the debate still rages over who controls targeting and airspace deconfliction beyond the FSCL. This point was driven home during Operation Desert Storm when the FSCL was originally located at the border between Saudi Arabia and Iraq, thus restricting deep operations by the U.S. Army, and then moved too far north to allow the U.S. Air Force to pursue the retreating Republican Guard in the waning hours of the "100-hour war." The same problem existed more than a decade later in Operation Iraqi Freedom, despite the introduction of killbox CAS, which separated the area of responsibility into grids that could be cleared individually down to 5 nautical mile squares. Marines, on the other hand, tend to keep the FSCL close to the forward line of troops to ease integration of their organic air assets, which also allows more freedom of action beyond the FSCL. The 1994 U.S. Air Forces's *Joint Force Air Component Commander (JFACC) Primer* concluded, "The most reliable way to maximize the enemy's risk is to place the FSCL at the range where artillery and missiles stop being the greatest threat to the enemy and air attack becomes the greatest threat" (p. 34). This sounds easy in theory, but in practice, especially in modern maneuver warfare where the front line changes by the minute, or in counterinsurgency fights that do not have a definable distinction between friend and foe, and in areas where covert action is the norm, the placement of fire support coordination measures can be problematic.

In spite of many studies, after-action reports, and discussion among joint doctrine experts, this argument has yet to be fully resolved.

The Contemporary Period

The arrival of Global Positioning System-guided precision munitions, unmanned combat aerial vehicles, and digital satellite communications linking the battlefield to a global command and control network have transformed the CAS environment. CAS doctrine also experienced a transformation when the army and air force established the Air Land Forces Application Agency in 1975 to develop multiservice tactics, techniques, and procedures to fill interoperability voids between units, staffs, and the armed services. The navy and marines joined the project in 1992, and it became the Air Land Sea Application Center, which now provides a forum to share joint expertise in areas such as joint fires, aviation urban operations, and the theater air-ground system.

Two major technological revolutions have shifted CAS from the tactical to the strategic level of war. The first is the 24-hour news cycle fueled by global access to local news via the Internet and the second is the ability of rear-echelon air operation centers to *see* and *affect* the battlefield through radar, electro-optical/infrared imagery, and even live-streaming video from the RQ (Pioneer, DarkStar, Global Hawk, Hunter, Shadow, Raven) and MQ (Predator, Reaper, Fire Scout, Warrior) series of remote-piloted weapon systems. These technologies have taken a battlefield effect and put it into the daily lives and decision-making cycles of our most senior leaders.

The use of bombers, such as the B-1 Lancer ("Bone"), has also changed the landscape of coordination procedures and expectations for CAS. In some cases, aviators operating at high altitude only require coordinates or use a targeting pod that practically removes the need for a colocated tactical air control parties with eyes on the target. It is likely that in the not too distant future, unmanned combat aerial vehicles such as DARPA's X-45 may exceed current manned capabilities in the critical areas of cost/maintainability, range/endurance, survivability/firepower, and sensors/communications. The question remains whether they will be more or less effective in higher threat environments.

On the darker side, though exact statistics are difficult to obtain, it is generally accepted that about

U.S. Marine Corps Corporal Caleb Love watches for insurgent activity from the door of his UH-1N Huey helicopter while providing close air support for coalition forces engaging insurgents in the city of Ubadyi, Iraq, during Operation Steel Curtain on November 16, 2005. Love is a Huey helicopter crew chief with Marine Light Attack Helicopter Squadron 369 of Camp Pendleton, California.

2% of casualties between World War I and Vietnam were caused by fratricide, but in recent operations such as Desert Storm, Operation Enduring Freedom, and Operation Iraqi Freedom, the fratricide level has been significantly higher, in most cases exceeding 10%. These figures are not solely attributable to CAS and are significantly inflated due to greater accountability, better reporting procedures, and the current enemy's general inability to inflict mass casualties. Yet the potential for fratricide and collateral damage from air strikes has induced changes in strategy, as evidenced by General Stanley McChrystal's 2009 directive to restrict the use of CAS in residential areas. However, the problem has less to do with a specific deficiency in CAS platforms or doctrine and more to do with the character of urban combat,

the lack of coherent strategic communications, and a counterinsurgency strategy of avoiding civilian casualties at all costs. Similar problems were solved by the French in Algeria by establishing *quadrillage* (surveillance using a grid pattern) and *regroupment* (village resettlement) to allow free-fire areas for mobile helicopter search-and-destroy missions.

No matter what the service, country, or cause, CAS is a difficult and dangerous mission for both those in the air and those on the ground. While proper doctrine can make coordination easier, and specially designed aircraft can make execution safer, the most enduring aspect of ensuring effective and efficient CAS is constant cooperation between air and ground forces. Among the most significant non-technological developments are enhanced training

The aircraft carrier USS *Harry S. Truman* (CVN 75) sits in the Persian Gulf as the crew conducts shipboard and small boat drills on February 8, 2005. The Truman Strike Group and Carrier Air Wing 3 are conducting close air support, intelligence, surveillance, and reconnaissance missions over Iraq.

opportunities for CAS pilots to work more closely with ground forces under realistic conditions, such as Green Flag at the Joint Readiness Training Center in Fort Polk, Louisiana, and the National Training Center at Fort Irwin, California. As stated in Joint Publication 3-09.3, *Joint Tactics, Techniques, and Procedures for Close Air Support* (2003), “Although simple in concept, CAS requires detailed planning, coordination, and training for effective and safe execution” (chap. 1, p. 1). Regardless of who has control of the airspace and assets or what the platform looks like, CAS will be successful only with a common understanding of the capabilities and limitations each arm of the combined team brings to the fight, a shared mental model of the tactical situation

and operational objectives, and constant training between air and ground forces.

COALITION, WARFARE

Coalitions represent the wartime alliance between multiple partners designed to meet specific, and often short-term objectives. Coalitions can traditionally be differentiated from alliances in terms of membership, with coalitions often consisting of multiple partners, and their short life span, often being disbanded after meeting the coalition's specific

wartime goals. Coalitions in the 20th century tended to blend the line between alliance and coalition more so than in the 19th century when coalitions only tended to be formed in times of conflict. Increasingly, the peacetime alliances of the 20th century became the wartime coalitions that dominated warfare in that century. Nations that participate in coalitions are often motivated primarily through self-interest, generally this being a sense of self-protection. This entry examines the characteristics of coalitions and gives examples of how they functioned in the 20th century.

Characteristics of Coalitions

Coalitions are extremely varied in their makeup and in how they function, but there are characteristics that are common to most. Generally, coalitions tend to fall into two patterns of partnership. The first is between equal states. An example here would be the relationship between Great Britain and France during World War I that saw both powers vying to claim an equal share of leadership within the coalition. The second is between greater and lesser powers. A prime example here would be the U.S.-Australian coalition in the Pacific during World War II. In this example, the United States, owing to its economic and material advantage, clearly was the partner who determined the coalition's course of action during the conflict.

The historian Jehuda Wallach notes that the effectiveness of a coalition is determined by several factors. In a coalition of equals, such as the British-French example, the success of the coalition is often linked to the relationships that emerge between commanders in the field more than on the relationship between the individual states' governments. In a coalition between a greater and lesser power, it is not necessarily true that the greater power will always exert the greatest influence over the coalition. Multiple factors must be taken into consideration for determining how effectively the greater power will dominate the relationship. The two most important aspects that must be considered are first, an abundance of manpower, and second, greater economic power. The U.S.-Australian example provides ample evidence of how these two factors are the most important in determining a greater power's effectiveness in shaping a coalition relationship.

Until the United States established a preponderance of power in terms of men and materials, Australia was able to negotiate a larger role for itself in the military partnership. However, after mid-1942, the United States generally was able to dictate the plan of action in the southwest Pacific.

Coalitions, because of the multiple actors involved as well as the various levels of contact, can be notoriously difficult to manage successfully. The coalitions crafted to challenge Napoleon in the early 19th century stumbled before finding success in 1814 and then again in 1815. Several notable weaknesses of coalitions include the divergent war aims of the multiple partners, the failure of coalition partners to effectively coordinate political and military relationships, the impact of public opinion within each member state, language barriers, the question of the amalgamation of coalition forces, the coordination of logistics, and the difficulty of imposing a supreme command structure on a coalition.

Another important characteristic of coalitions is that they amplify the resources available to member nations to carry out military actions. This has had the effect of making wars longer in duration and greater in their destructive capability. Also, the diverging aims and interests of partner nations serves to make the achieving of peace a more difficult process. In many ways, coalition warfare serves to make the crafting of a peace more difficult than the winning of the war itself. A prime example here is the attempt by the Allied powers and the United States to reach a consensus peace during the Versailles Peace Conference in 1919.

Examples of Coalitions in the 20th Century

American involvement in World War I is representative of coalition warfare. Unlike the British, French, or Russians, the United States was not tied by any formal alliance structure to the Allied effort. This was even noted by the Wilson administration's decision to adopt the title of Associated power rather than Allied power. American involvement was short term and designed to meet specific objectives: the defeat of Imperial Germany and to secure the United States a bargaining position in crafting the postwar peace. After the end of the conflict, the United States did not maintain any formal military relations with the Allied powers.

The example of World War II blurred the line between alliances and coalitions. While the United

States, Great Britain, and the Soviet Union were not tied by any formal alliance, the cooperation displayed, especially between the American and British militaries, went beyond the generally ephemeral nature of coalition warfare. World War II was also important in helping reshape thinking on the place of coalitions in world affairs. In the aftermath of World War I, many states had looked at coalitions as a root cause of the conflict and sought to limit their use. World War II reversed that trend as the growing threat of the Cold War with the Soviet Union made coalitions a necessity in the post-World War II era.

The most recent example of the functioning of a coalition in wartime was the Persian Gulf War in 1990–1991. In the aftermath of the Iraqi invasion of Kuwait in August 1990, the United Nations passed a series of resolutions that would result in the U.S.-led coalition of 34 nations evicting Iraqi forces from Kuwait after a brief air and ground campaign. U.S. president George H. W. Bush was especially keen to make sure that the military campaign was not seen as a wholly American operation to quell worries about the expansion of U.S. influence in the Middle East.

COALITION PROVISIONAL AUTHORITY

The Coalition Provisional Authority (CPA) was a multinational governing body formed to rebuild Iraq in the wake of the 2003 invasion by a coalition led by the United States. Citing UN Security Council

Resolution (UNSCR) 1483, and the laws of war, the CPA assumed a mission as the de facto government within Iraq to restore conditions of security and stability, to create conditions in which the Iraqi people could freely determine their own political future, and to facilitate economic recovery, sustainable reconstruction, and development. It vested itself with executive, legislative, and judicial authority over the Iraqi government to provide for the effective administration of Iraq during the period of transitional administration. This entry discusses the background and history of the CPA from its beginning in 2003 and its activities until its dissolution in 2004.

Background and Formation of the CPA

Following the successful invasion and deposition of Saddam Hussein's regime in Iraq, the responsibility for overseeing reconstruction efforts in Iraq fell to the Office of Reconstruction and Humanitarian Assistance led by retired U.S. Army lieutenant general Jay Garner. Recognizing the events surrounding the invasion of Iraq by coalition forces, the UN Security Council passed UNSCR 1483 charging the coalition with the obligation as the occupying authority to promote the welfare of the Iraqi people, restore security, and create conditions that would allow Iraqis to determine their future. UNSCR 1483 made the coalition the legal governing authority, recognized the creation of a transitional Iraqi government council, and removed previously imposed sanctions placed on the former regime of Saddam Hussein. Under the oversight of an international body, the International Advisory and Monitoring Board, and with explicit input from the Iraqi people, UNSCR 1483 also authorized the coalition authority to utilize Iraq's oil revenue for postwar development. While UNSCR 1483 did not expressly establish a specific organization to carry out the coalition's responsibilities, it would become the legal foundation for the creation of the CPA when on May 16, 2003, the U.S. presidential envoy to Iraq, Ambassador L. Paul Bremer, issued CPA Regulation Number 1. CPA Regulation Number 1 identified Bremer as the administrator of the CPA; promulgated the authority of the CPA to temporarily administer Iraq with all executive, legislative, and judicial authority necessary to achieve its objectives; designated the commander of coalition forces in direct support of the CPA to promote a

safe and secure environment in Iraq; and established the applicable laws, regulations, and orders with which the CPA would carry out its functions. With this proclamation, the Office of Reconstruction and Humanitarian Assistance ceased to exist and Garner returned to the United States.

When he was named presidential envoy to Iraq, Bremer was charged with oversight of the coalition's reconstruction efforts and a process by which Iraqis could rebuild their governing institutions. As the administrator of the CPA, Bremer reported to the president of the United States through the secretary of defense as he directed and coordinated all U.S. government programs in Iraq not under the control of the U.S. military's Central Command commander. From his headquarters in Saddam Hussein's former Republican Palace in Baghdad, Bremer organized the CPA around seven staff offices (Security Affairs, Economic Policy, Civil Affairs, Oil Policy, Communications, Regional Operations, and Development) and four geographic headquarters (North in Irbil, Central in Baghdad, South Central in Al Hillah, and South in Basra). Each regional headquarters operated semiautonomously to build four common postwar reconstruction pillars of sovereignty: (1) security, (2) essential services, (3) economy, and (4) governance.

CPA Activities and Dissolution

On the same day as the CPA's establishment, Administrator Bremer issued CPA Order 1 for the disestablishment of the Iraqi Baath party. With this order, full members of the Baath party were removed from their positions and banned from future employment in the public sector. Furthermore, the top three layers of management in every government institution were subject to investigation for affiliation with the Baath party and possible criminal conduct. With significant implications for the future occupation of Iraq by the coalition, the expressed intent of the order was to ensure that the future government in Iraq is not threatened by Baathist elements returning to power. Quickly compounding the effects of CPA Order 1, Bremer issued CPA Order 2 on May 23, 2003, formally disbanding the Iraqi army, effectively placing 300,000 armed men out of jobs and on the streets.

In keeping with the authorities of UNSCR 1483, the CPA issued Regulation 6 on the formation of

the Iraqi Governing Council as the principal body of the Iraqi interim administration, pending the establishment of an internationally recognized, representative government by the people of Iraq. The Iraqi Governing Council was bestowed authorities and responsibilities outlined in UNSCR 1483 to ensure that the interests of the Iraqi people were represented in both the interim administration and in determining the means of establishing a representative government through consultation and coordination with the CPA.

Again, with respect to UNSCR 1483, the coalition “authority” was to be responsible for administering a development fund for the postinvasion reconstruction. Within UNSCR 1483, the UN-administered Oil-for-Food Program ended, and it transferred funding authority to the CPA to provide funding for the postwar reconstruction programs: governance, security, economy, and essential services. As its primary governance role, the CPA’s charge was to restore full sovereignty to the Iraqis. With the establishment of the Iraqi Governing Council, the Transitional Administrative Law, and elections that led to the creation of the interim Iraqi government, the CPA charted the path toward Iraqi sovereignty. Within the security program, the CPA helped the Iraqis create the means to assume responsibility for their internal and external security. It thus laid the foundation for various security services and organizations, including the Ministries of Defense and Interior, the Iraqi army, and Iraqi Police Service to help define the legal framework of those entities within the new government. Principally through management of Iraq’s wheat purchase program, a currency exchange program, and energy infrastructure programs, the CPA enabled Iraq to transition to a market-based economy. Finally, the CPA worked to restore Iraq’s essential services to near and beyond preinvasion conditions. The CPA initiated the reconstitution of Iraq’s dilapidated infrastructure after a decade of atrophy with development programs in oil production, water and sanitation infrastructure, transportation and communications networks, and essential services of health and education.

On June 1, 2004, the Iraqi Governing Council dissolved itself after having approved the Transitional Administrative Law for Iraq and subsequent establishment of the Interim Government of Iraq. Within little more than a year after the expulsion of Saddam Hussein’s regime and 2 days prior to the

UN-imposed deadline for ending the occupation of Iraq, Bremer handed over legal documents to the Iraqi chief justice on June 28, 2004, declaring Iraq a sovereign state. Subsequently, with this transfer of power, the CPA ceased to exist, and Bremer returned to the United States.

COAST GUARD, U.S.

Established by law in 1915, the modern Coast Guard joined together the Revenue Cutter Service, whose origins date back to 1790, and the civilian Life Saving Service. In 1939, the Lighthouse Service was amalgamated with the Coast Guard. Historically, they performed numerous functions, from enforcing customs laws to steamboat inspections. Between 1915 and 2003, the Coast Guard operated under the control of the Navy, Commerce, and Transportation Departments at various times. In 2003, the Coast Guard was transferred to the Department of Homeland Security as part of a reorganization of governmental law enforcement agencies. This entry discusses the history, missions, personnel, and vessels and aircraft of the U.S. Coast Guard.

History and Organization

America’s Coast Guard is a uniformed military service, even though it is not part of the Department of Defense. As an armed force, Coast Guard authorities include those given under Title 10 in U.S. Code.

By law, during wartime, the president may transfer the service to the secretary of the navy. Only in World War I and World War II did the Navy Department take control of the Coast Guard. In other conflicts, the Coast Guard remained under the Treasury Department, later Department of Transportation, and later Department of Homeland Security. The Coast Guard's roles in the two World Wars were extensive. In both conflicts, the Coast Guard engaged enemy submarines off the coast of the United States in addition to rescuing survivors from sunken merchant ships. The Coast Guard also had principal responsibility for securing American ports from sabotage. In World War II, the Coast Guard created an elaborate system of beach patrols to prevent the landing of enemy agents and saboteurs. In addition, Coast Guardsmen and vessels participated in a number of overseas operations, including the invasion of Guadalcanal and the D-Day landings on June 6, 1944.

Since World War II, the Coast Guard has remained independent of the U.S. Navy but has participated in every war of the Cold War and post-Cold War eras. In the aftermath of the September 11, 2001, attacks, the Coast Guard's tradition of port security and coastal patrolling was given renewed emphasis.

Missions

Coast Guard personnel differ from the armed forces serving under the Department of Defense in that they also have federal law enforcement authorities under Title 14 in the U.S. Code. U.S. Coast Guard active-duty commissioned, warrant, and petty officers have authority to enforce federal laws. The service can enforce federal laws on waters subject to U.S. jurisdictions, in international waters, and on all vessels under U.S. jurisdiction. Unlike the armed forces serving under the Department of Defense, the Coast Guard is exempt from the Posse Comitatus Act of 1878 (18 U.S.C. § 1385), which prohibits federal military forces from conducting domestic law enforcement.

The U.S. Coast Guard is the nation's largest maritime law enforcement agency and possesses broad jurisdictional authority, as well as significant regulatory and public safety responsibilities. The Coast Guard is a multimission force. Its primary responsibility is to serve as the lead federal agency for homeland security. On December 21,

2004, the principal assigned duties were described in the National Security Presidential Directive 41/Homeland Security Presidential Directive 13—National Strategy for Maritime Security Supporting Plans. The Coast Guard's current duties include coordinating the Maritime Operational Threat Response Plan, designed to coordinate the federal response to threats in the maritime domain.

Coast Guard forces have many other duties, including conducting search and rescue at sea; fisheries protection; maintaining and operating the U.S. icebreaker fleet; maintaining maritime aids to navigation; marine environmental protection, including preventing invasive species and responding to oil and chemical spills; marine safety; and coordinating ports, waterways, and coastal safety and security, including serving as the "captain of the port" and permitting bridge construction.

Among the service's law enforcement missions is serving as the lead federal agency for enforcing U.S. immigration laws at sea. The Coast Guard monitors maritime transit zones not only to interdict but also to assist and rescue undocumented migrants. Drug interdiction is another significant law enforcement responsibility, one that entails a significant deployment to the Caribbean.

The humanitarian role of the Coast Guard remained a mainstay of this armed service even after 9/11. Coast Guard vessels and aircraft annually rescue scores of merchant sailors and pleasure boaters, often in extreme weather conditions. After Hurricane Katrina hit New Orleans in 2005, the Coast Guard rescued more than 24,000 individuals from rooftops and flooded homes and evacuated several thousand medical evacuees.

International Role

The Coast Guard is also the lead U.S. representative to the International Maritime Organization. It is the specialized agency of the United Nations responsible for improving maritime safety and preventing pollution from ships. After 9/11, the Coast Guard was instrumental in developing and securing the adoption of the International Shipping and Port Facility Security Code, an initiative to establish global standards for improving security and combating terrorist threats to seagoing vessels and maritime infrastructure.

In addition to its "warfighting" missions, the Coast Guard provides training assistance to foreign

coast guards and maritime services. It has assisted several Latin American countries to bolster their abilities to counter the international drug trade. After the United States removed President Manuel Noriega from power in Panama in 1990, the Coast Guard assisted Panama in rebuilding its maritime service.

The Coast Guard also participates in the International Ice Patrol that tracks icebergs in the North Atlantic and ensures that they do not obstruct commerce.

Personnel

In 2009, the Coast Guard included 42,000 men and women on active duty, 7,500 reservists, 29,000 auxiliaries, and 7,700 full-time civilian employees. The Coast Guard Academy in New London, Connecticut, serves as the primary source for commissioned officers, and the facility in Cape May, New Jersey, is the sole training center for new enlisted personnel.

The Coast Guard has a history of African American service that dates back to the origins of the revenue cutters in the 1790s and later the Lifesaving Service. The Coast Guard was ahead of the U.S. Navy in World War II in commissioning Black officers and integrating vessels and land stations. Institutionally, the Coast Guard proved much more willing than the U.S. Navy and other branches in fully integrating its service. Despite this historical commitment, the Coast Guard currently has the lowest proportion of service by African Americans in the enlisted and officer corps.

In World War II, the Coast Guard did create a reserve program for women—SPARs—and more than 11,000 served during the conflict. The name was derived from a contraction of the Coast Guard motto “Semper Paratus,” and its meaning, Always Ready. In contrast to the other armed services, women were completely demobilized from this branch after the conflict’s end. The Korean War led to the reactivation of the women’s reserve, and a small number of women continued to remain in the service through the 1970s.

The Coast Guard was quite responsive to the women’s movement that emerged in the 1970s. It was the first service to abolish combat exclusion that limited the assignments that women officers and enlisted personnel could hold. In 1976,

the Coast Guard Academy became the first service academy to admit women. The Coast Guard was also ahead of the U.S. Navy in integrating women into combat vessels. In 1977, a total of 24 women were sent to serve aboard the *Morgenthau* and the *Gallatin*—2 female officers and 10 enlisted personnel per ship. Two years later, a woman officer was appointed to command the cutter CGC *Cape Newagen* operating in Hawaii.

Vessels and Aircraft

In contrast to U.S. Navy ships, Coast Guard vessels are lightly armored and carry modest armaments. The Coast Guard divides vessels in its fleets into two classes: (1) cutters and (2) boats. Cutters are more than 65 feet in length and have adequate accommodations for the crew to live aboard. Vessels less than 65 feet in length are considered boats and are deployed primarily to inland rivers and lakes. Since responsibility for maintaining navigation aids forms a significant aspect of the Coast Guard’s mission, much of the fleet consists of buoy tenders and other similar vessels. Icebreakers are the largest vessels in the Coast Guard’s fleet.

High endurance cutters, 378 feet in length, serve as the primary vessels for law enforcement, as well as search and rescue operations on the high seas. The bulk of the *Hamilton* and *Hero* classes of cutters were built in the 1960s and 1970s and underwent modernization in the late 1980s. The *Bear* class of medium endurance cutters (270 feet) was intended to engage in antisubmarine warfare during times of war and routinely join the larger cutters in search and rescue operations. The 210-foot *Reliance* class cutters were primarily designed to support search and rescue operations and are capable of towing a 10,000-ton vessel. Built in the 1960s, these vessels were modernized in the 1980s with modifications that included increased emphasis on their firefighting capabilities. Since World War II, the U.S. Navy has given the Coast Guard castoffs, including a fleet of ice breakers in the 1960s. For instance, *Alex Haley*, a former navy salvage ship, 282 feet in length, entered the Coast Guard service in 1999 and is stationed in the Bering Sea and operates in Alaskan waters.

The Coast Guard has a fleet of 211 fixed- and rotary-wing aircraft, which are used for patrols and rescue missions of vessels in distress. Coast Guard

aviation assets are based both on shore and on larger cutters with helicopter flight decks.

Command

The Coast Guard commandant is a four-star equivalent. An admiral appointed by the president, the commandant is not formally part of the Joint Chiefs of Staff but is invited to participate in Joint Chiefs of Staff discussions that affect Coast Guard operations and activities.

Institutional and administrative components of the service are headquartered in Washington, D.C., with responsibilities divided between the deputy commandant for operations, who oversees marine safety, security, and stewardship programs, and the Coast Guard chief of staff, who supervises personnel, logistics, and acquisition.

The operational Coast Guard is organized into 17 districts divided between the Atlantic and Pacific Commands, each under a three-star flag officer. District commanders control most Coast Guard forces in their geographic area of operations. In 2007, the service established the Deployable Operations Group, which has a national rather than a regional mission. Its mission is to deploy specially trained and equipped maritime security assets under a single unified command authority for special missions, such as counterterrorism operations.

Homeland Security

Before 9/11, the Coast Guard was already hard pressed to perform all its missions with available resources and personnel, especially given the renewed emphasis on port security and securing the borders. In addition, the service's ships and planes had not been modernized since the 1960s. Following the Coast Guard's transfer to the Department of Homeland Security, the service felt even greater stress in accomplishing its assigned missions. As of 2010, the service also lacked sufficient personnel to fully man the reorganization in the Atlantic and Pacific Commands begun in 2007.

Though the Coast Guard had stated as its objective to perform all non-homeland security-related law enforcement activities back to 95% of pre-9/11 levels by the end of 2004, that goal proved elusive. According to the Coast Guard's Annual Performance Review,

the gap between resource hours between homeland security and non-homeland security missions has narrowed since 2004 from 26% to 10%. Yet balancing missions remains difficult. As of Fiscal Year 2009 (October 2008 to September 2009), the service only reached its performance goals in 6 of 11 mission areas. Coast Guard combat readiness levels were achieved only 44% of the time. The service's goal is 100%.

In addition to struggling with a "high operational" tempo (frequently deploying personnel and equipment for missions), the service continues to remain hamstrung by chronically low budgets that do not allow for adequate investments for modernizing ships and planes. In 2002, the Coast Guard undertook a major servicewide acquisition program called Deepwater, but since its inception, the initiative has been plagued by underfunding, controversy, and cost overruns.

In an age when terrorism has blurred the boundaries between war and peace, the Coast Guard is the branch of the armed services uniquely poised to fight the Global War on Terrorism. In contrast to the uniformed services under the Department of the Defense, the Coast Guard has a long tradition of enforcing a range of criminal laws and appears poised to maintain its central role in military and law enforcement operations in the future.

CODE OF CONDUCT

The Code of Conduct, now formally known as the Code of the U.S. Fighting Force, provides American military personnel with guidelines for dealing with the threat of capture, interrogation, and coercion by enemy forces. The code was approved by President Dwight D. Eisenhower on August 17, 1955, with the expressed purpose of better preparing each service member “to counter and withstand all enemy efforts against him,” and to help instruct him on “the behavior and obligations expected of him during combat and captivity.” Today, every member of the U.S. Armed Forces receives annual training on the code. High-risk personnel, such as pilots and commandos, receive additional training in survival, evasion, resistance, and escape techniques, known as SERE. This entry highlights the content of the code and its history from the Korean War to the present.

Prior to the Korean War, American military leaders paid little attention to the conduct of captured Americans. The United States did participate in a series of international agreements, most notably the Geneva Conventions of 1949, that defined the responsibilities of captors toward enemy prisoners of war, but these agreements ignored the responsibilities of the prisoners themselves.

Korea, however, marked the first conflict in which enemy captors waged a comprehensive campaign to exploit American prisoners for political gain. During the war, North Korean and Chinese jailers employed torture, starvation, and intense political indoctrination to coerce various acts of collaboration from their American prisoners, including radio broadcasts, peace appeals, and germ warfare confessions. In addition, 21 Americans (and one British marine) refused repatriation at war’s end, leading many to suspect that the communists had somehow “brainwashed” their captives. These suspicions gained publicity at the height of the McCarthy era, when many Americans feared a secret communist plot to overthrow the government.

Under intense pressure to address reports of widespread misconduct and brainwashing, Secretary of Defense Charles E. Wilson appointed a Pentagon committee to study these allegations and propose solutions. The committee heard expert testimony from scholars, physicians, and former prisoners and recommended a series of policy changes, including

establishment of a code to guide the conduct of captured American servicemen. The code’s six articles emphasized the prisoner’s obligation to resist capture, keep faith with fellow prisoners, obey lawful orders, and “make every effort to escape.”

In addition, prisoners were to provide interrogators with only their name, rank, service number, and date of birth, later dubbed “the Big Four.” According to an internal Pentagon summary of the committee’s deliberations, U.S. Air Force representatives initially opposed this restriction as unrealistic, archaic, and inherently passive. They advocated that prisoners be allowed to discuss routine matters that provide no aid to the enemy while making every effort to evade and resist interrogation by adopting various stratagems designed to mislead the interrogator. U.S. Army, Navy, and Marine Corps representatives, however, insisted on the more restrictive language, and the air force complied. Although the code was not incorporated into the Uniform Code of Military Justice, it repeatedly emphasized the accountability of prisoners for their actions.

Following Eisenhower’s approval, the Pentagon distributed several thousand copies of the Code of Conduct to schools and civic organizations while implementing a broad, well-publicized program of training within each branch of the armed forces. In response to the brutal interrogation of its pilots during the Korean War, the air force established a school for SERE, and attendees endured imprisonment, interrogation, and mistreatment within a mock prison camp. During the Vietnam War, the other services established their own schools, each designed to provide intensive training for those personnel considered most vulnerable to capture and exploitation.

The Vietnam War provided a grim test of the newly established code. As in Korea, Americans were again fighting to defend an ally from communist aggression, and as in Korea, the Vietnamese communists abused and tortured captured Americans to gain propaganda victories. Unlike their predecessors, however, the majority of Americans captured in Vietnam were air force and navy pilots. These prisoners were generally older, better educated, and better trained than the thousands of young, poorly trained enlisted men captured by the Chinese and North Koreans in the previous war.

After their release in 1973, relatively few American prisoners of war were accused of

collaboration or misconduct, suggesting that the code had achieved its desired effect. Many returning prisoners of war echoed this sentiment, citing the code as an inspiration to continue resistance despite several years of confinement, mistreatment, and physical and mental abuse.

Critics, however, noted that few prisoners actually managed to maintain the code's idealistic standards in the face of prolonged torture, and several incidents since Vietnam seem to reinforce this criticism. During the Persian Gulf War of 1991, for example, captured American pilots appeared on Iraqi television to condemn American "aggression." In 1994, a disoriented army helicopter pilot who was shot down over North Korea confessed to having committed "an intolerable crime." Although each case violated the code's restriction against making "oral and written statements disloyal to my country," the Pentagon took no punitive action after these prisoners were repatriated, suggesting a more flexible interpretation of the code's requirements.

The original code has been modified twice since 1955. In 1977, President Jimmy Carter authorized removal of the word "only" from the article describing information that prisoners could share with their captors. This change removed the restriction to "the Big Four." In 1988, President Ronald Reagan authorized a change in language that made the code gender neutral.

Today, all American service members continue to receive periodic training on the Code of Conduct. SERE training has expanded to accommodate more students, and the focus of that training has changed to reflect the challenges of combat in the 21st century, which include potential capture by warlords, criminals, and terrorist groups.

COLOMBIA

On the surface, Colombia would appear to have the potential for greatness within the environs of the Western Hemisphere. With its capital in Bogotá, Colombia's 2010 population of 44.2 million made it the fourth largest nation in Latin America. The country enjoys both ample resources and access to markets via the Pacific Ocean and the Caribbean.

Unfortunately, despite these advantages, Colombia has been beset by violence for much of its history. Some clashes have been political in nature. After achieving independence from Spain, the country oscillated between oligarchical rule and outright dictatorship. Violence employed in the service of state power is a common, well-established practice. Consequently, the rule of law has suffered. In the modern era, Colombia's most recent constitution dates back to only 1991.

Economically, Colombia has undergone significant changes since World War II. Once dominated by agriculture, services (52.9%) and industry (37.5%) drive the contemporary legal economy. Although the country posted impressive growth rates in the recent past (7.7% gross domestic product in 2007), the global recession has largely reversed this trend. Colombia, like many of its Latin American counterparts, is experiencing steep economic decline today.

Colombia's society has changed as much as its economy. After World War II, approximately 70% of the country lived in rural areas. Presently, that proportion is reversed. Many are attracted by higher wages or the prospect of better public services in cities like Medellín. Others have simply escaped failed farms or encroaching violence. Urban migration has largely failed to meet many of these expectations. The massive shantytowns surrounding Colombia's major cities are rife with disease, primitive living conditions, unemployment, and underemployment. Rather than serving as a brake on criminal

enterprises, they are often a haven for crime, from petty theft to the great drug cartels. The ongoing drug war, discussed below, has exacerbated social problems. Endemic warfare between the government, the cartels, guerrillas, and right-wing paramilitary groups has imposed a heavy cost on the average citizen. In 2002, Colombia had the third highest number of internal refugees in the world after Angola and Sudan. This entry explores the history of Colombia, with a focus on Colombia's drug trade, *La Violencia*, and the relationship between Colombia and the United States.

From *La Violencia* to the War on Drugs

The event most important to Colombia today is *La Violencia* (1948–1965), the civil war between the nation's Liberal and Conservative parties that resulted in the deaths of approximately 160,000 people. The bloodletting effectively destroyed constructive political dialogue in its aftermath and retarded anything resembling the reconstruction of basic social institutions. The mid-1960s brought little relief. During the heyday of the Alliance for Progress, a massive U.S.-sponsored program that introduced billions of dollars of economic and military aid to Latin American countries, American assistance improved Colombia's ability to resist a Cuban-inspired revolution. Counterinsurgency programs focused on internal stability but failed to identify the dividing line between political dissent and subversion, a distinction already blurred by the two major political parties during *La Violencia*. Consequently, American aid supported the formation of irregular civil defense groups designed to aid the state in prosecuting the war against insurgents. These paramilitary organizations were the genesis of the United Self-Defense Groups of Colombia (*Autodefensas Unidas de Colombia*, or AUC) that dominated the country a generation later. In response, the Colombian Left armed itself. One offshoot was the Revolutionary Armed Forces of Colombia (*Fuerzas Armadas Revolucionarias de Colombia*, or FARC) in 1964. As was the case with many embryonic Marxist and leftist organizations of the time, the armed force demonstrated solidarity with the Cuban Revolution. It also became a necessary component of self-preservation and the promotion of a political agenda in a country lacking the rule of law.

The drug war is the most recent chapter in a much longer history of violence. This was particularly evident during the so-called extradition wars that raged between the national government and the cartels from 1984 to 1991. Provoked by deliberate attempts to bring traffickers to justice in Colombia and the United States, the cartels unleashed a wave of assassination attempts and attacks on the police, the judiciary, and other public officials. Thousands were killed and wounded in the process.

Colombian authorities responded in kind. The dramatic death of Pablo Escobar on a Medellín rooftop in 1993 highlighted what became a larger police and military campaign against the Medellín and Cali cartels that largely succeeded in the 1990s. However, the defeat of two larger organizations did not result in a victory in the drug war. In relatively short order, the two cartels were replaced by hundreds of small organizations.

Thus, a combination of factors facilitated Colombia's evolution into the primary source of cocaine in the Western Hemisphere. Chronic internal instability created a political, economic, and social vacuum that the cartels readily filled. At the same time, increasing U.S. and Western demand facilitated the transfer of millions (and later billions) of dollars into the hands of criminal organizations, guerrilla groups, and corrupt government officials. In 2007, the UN Office on Drugs and Crime estimated that Colombia produced 600 metric tons of cocaine with a "farm gate" value (i.e., the wholesale value of coca leaf and paste) of \$934 million.

Moreover, the drug trade essentially rescued a declining Marxist guerrilla movement from oblivion. As the Medellín and Cali cartels retreated under U.S. and Colombian pressure, the FARC filled a specific vacuum, providing security for smaller, emerging drug traffickers in exchange for cash. The actual amounts are staggering. By the late 1990s, academic sources estimated that narcotics provided guerrillas between \$500 million and \$1.5 billion annually. The financial boon allowed FARC strength to increase to approximately 15,000 fighters by 2000. It has also reportedly financed connections with organized crime in Chechnya, Russia, Ukraine, and Uzbekistan. These relationships have improved the market for Colombian cocaine and granted traffickers ready access to vast stores of Cold War-era weaponry. Both the cartels and smaller Colombian syndicates have similarly benefited from outside

expertise. Lacking the ability to construct truck bombs in 1993, Pablo Escobar simply contracted out the work to the FARC rival, the Colombian National Liberation Army (*Ejército de Liberación Nacional*, or ELN).

Colombia and the United States

Since the conclusion of World War II, the Colombian military has largely operated as an adjunct of the U.S. military establishment. Bound to the United States by the 1947 Rio Pact and the Inter-American Defense Board, Colombian training, equipment, and force structures have largely mirrored American standards. Today, counternarcotics programs have replaced Cold War priorities and tied the two countries together even more closely. Between 1987 and 1994, the United States provided half of the \$320 million in arms purchased by Colombia. Beginning in 1990, the United States provided military sales for counternarcotics operations in the amount of \$15.4 million. This quickly expanded to \$58.1 million by 1992. Colombia's 2005 military expenditures, as a percentage of its gross domestic product, placed it 35th in the world and the highest of all Latin American nations.

Military training under American auspices also significantly grew. Colombia provided the largest contingent to be trained as part of the U.S. International Military Education and Training program. A total of 7,618 personnel, or more than a third of those trained in Latin America, received instruction in the United States and at facilities scattered around the hemisphere.

Although the Ronald Reagan, George H. W. Bush, and Bill Clinton administrations devoted considerable time and resources to the drug war in Colombia, it received an additional boost in the late 1990s when American policymakers officially adopted what became known as Plan Colombia. Originally developed by the Colombian government in 1999, the \$7.5 billion strategy promised an integrated political, military, and economic effort on a national scale.

Toward these ends, the United States provided \$1.3 billion in assistance for a major effort against drug trafficking at its source. The American military expanded its system of ground-based radar installations to close holes in surveillance previously exploited by smugglers using small aircraft.

American aid also increased Colombian mobility through the provision of UH-60 and UH-1H helicopters. Between 1999 and 2003, the Colombian military and police received 84 new aircraft. To bolster the flow of information regarding insurgent and trafficking organizations, U.S. intelligence provided greater cooperation, particularly with the police counternarcotics division (*Dirección de Antinarcóticos*, DIRAN).

On the ground, the United States expanded its training programs. To win back the initiative in the countryside and make full use of improved air mobile assets, U.S. advisors assisted in the creation of *Fuerza de Despliegue Rápido* in 1998 (Rapid Deployment Force). American military personnel were also responsible for creating three special forces battalions dedicated to counternarcotics operations in the southern departments of Caquetá and Putumayo. American assistance was instrumental in forming the Riverine Brigade as part of the Colombian Marine Corps to patrol the waterways of Putumayo, Guaviare, Guainía, and Magdalena Medio.

The September 11, 2001, attacks on the United States added yet another layer to the U.S.-Colombian military relationship. Counterterrorism programs have accelerated significantly in the past decade. Between 2002 and 2009, Colombian security forces received \$50.7 million in U.S. antiterrorism assistance and training. Some of this money, specifically \$10 million, went to protect oil infrastructure in Arauca. Other projects included training light units to combat terrorists in Colombia. American assistance created sixty-four 150-man mobile *carabinero* units—based on the U.S. Army Rangers—to patrol rural areas in search of guerrillas and terrorist cells.

Colombia's Drug Industry Today

The direct results of the war on drugs have been dubious at best. During the Clinton years, the total number of hectares under cultivation in Colombia alone grew from 39,700 in 1993 to 122,500 in 1999. Eradication programs initiated after 2001 were able to reverse this trend. However, cultivation rebounded from 78,000 hectares in 2006 to 99,000 hectares in 2007, a 27% increase. Potential cocaine production also remains high. According to the UN Office of Drugs and Crime, Colombia produced 600 metric tons of cocaine in 2007, down from the peak

of 695 metric tons in 2000 but almost double the total of 350 metric tons in 1997.

Despite the rapid uptick in U.S. aid under Plan Colombia, the FARC has been able to match American funding almost dollar for dollar. In 2000, the FARC secretariat instructed its various fronts to increase tax collection and other fund-raising to \$600 million a year, roughly equal to the 2003 American military and counternarcotics aid package of \$624 million. With money available on this scale, guerrillas and traffickers have advanced their purchases of sophisticated weapons and maintained their hold on Colombian officials who remain susceptible to bribery and intimidation.

Larger economic considerations are probably more to blame than simple incompetence or an over-emphasis on things military. The foremost dilemma in the drug war is the simple earning power of coca. A peasant in Peru's Upper Huallaga Valley cultivating coca for the drug industry could earn between \$8,000 and \$50,000 a year in 1988. No other cash crop comes close to this kind of wealth or influence. Evo Morales's rise from a national leader of coca farmers to president of Bolivia in December 2005 was a statement on Latin American politics and U.S. policy.

As a consequence of these factors, the drug war has taken on the appearance of a quagmire in Colombia and elsewhere. Despite the massive investment of time and treasure, as well as the increasing subordination of civilian law to military contingency, progress is tentative at best. Violence has spilled over into Ecuador, Panama, Peru, and Venezuela. In the meantime, drug trafficking has expanded into the less sanctioned areas of Central America and the Caribbean.

In the end, the drug war has failed because it is a conflict unredeemable by military means. The drug industry, indeed the entire process by which drugs are grown, processed, and distributed, lacks what the military terms *a center of gravity*. This was in evidence when the destruction of the Medellín and Cali cartels simply resulted in new networks that easily filled a vacuum created by the Colombian government. This basic reality applies to South America as a whole, wherein the decentralized nature of drug cartels makes the war analogous to squeezing a balloon. Even as Plan Colombia has advanced, success has not followed at the same rate in Peru or Bolivia.

COLONIAL WARS (1607–1774)

Anglo-American colonial warfare in North America, from the founding of England's first permanent settlement at Jamestown in 1607 to the eve of the American War of Independence in 1774, pitted England against Native Americans, imperial rivals, and its own colonists. The interaction of European and indigenous martial cultures, coupled with the introduction of Old World diseases and a global capitalist economy, made total wars the principal form of conflict on the continent. Anglo-American colonial warfare in North America consisted of four distinct phases. Phase 1 (1607–1688) was a period of proprietary warfare that established many of the enduring features of cross-cultural conflict in the New World. Phase 2 (1689–1753) was a period of proxy war that relied primarily on militia units. The French and Indian War, Phase 3 (1754–1763), was a

global imperial war marked by the increased use of professional soldiers and adherence to conventional European definitions of victory. Constabulary operations designed to consolidate Britain's tremendous territorial gains dominated Phase 4 (1763–1774); ironically, these operations ultimately enervated the empire. This entry discusses these four phases of warfare in colonial America.

Indian Warfare Before Columbus

Warfare among indigenous societies in pre-Columbian North America usually resulted from violations of reciprocity. This cultural tenet required individuals and groups to generously respond in kind in every aspect of their lives to demonstrate honor and trustworthiness. Reciprocity demanded leaders and groups meet their mutual obligations to one another, but it did not imply equality. Chiefs and senior alliance members frequently redistributed more wealth than they received as tribute to consolidate their position. Gift giving ceremonies and trading relationships were two of the most important acts of reciprocity and the likeliest to provoke conflict when groups violated conventional expectations because Indians interpreted the refusal to reciprocate as a sign of overt hostility. Trade was even more contentious because of numerous protocols that required political alliances before trade commenced, the recognition of trade routes as private clan property within communal societies, and the insistence on customary "prices" that did not fluctuate, according to the historian Denys Del  ge.

Precontact Native American wars fell into three broad categories that frequently overlapped one another: (1) "national wars," (2) "blood feuds," and (3) "mourning wars." Tribes fought "national" wars against their traditional enemies and allies who failed to meet their reciprocal obligations; in short, for political and economic reasons. Because these wars served as a form of negotiation, the antagonists often sent formal declarations of war to their opponents. Chiefs primarily mobilized warriors for these large-scale operations by conducting diplomacy with other villages where their clan members lived but sought allies among other nations as well. Blood feuds, on the other hand, were small-scale wars that sought vengeance because Indian notions of justice did not distinguish between personal acts of murder and killing that took place on the battlefield. Death

at the hands of an ally required a formal apology such as the calumet ceremony or a form of gift offering to compensate the clan for its loss. A killing by an enemy demanded blood revenge. According to the historian Daniel Richter, "mourning war" was a kind of blood feud predominantly practiced by the Iroquois, but in addition to revenge, it sought to replenish spiritual power and combat depopulation caused by disease and warfare by kidnapping and adopting enemies into the tribe. While most wars remained limited because of the combatants' desire to reestablish the status quo, power vacuums created by the generational rise and fall of chiefdoms, or "cycling," prompted sanguine wars of conquest.

The European Way of War

Europeans' ideological motivations for war differed significantly from those of precontact Indians. Europeans fought numerous religious wars in the 16th and 17th centuries. Although conflicts such as the German Peasants' War (1524–1526), the French Wars of Religion (1562–1598), the later English wars in Ireland (1570–1603, 1641–1653), and the Thirty Years' War (1618–1648) also had political, economic, and social motivations, the soldiers' belief that they were defenders of the true faith and instruments of God's will permitted them to commit atrocities as they sought to extirpate their Catholic or Protestant enemies. Ideology also justified unlimited violence against political enemies such as traitors and rebels. Lord Protector Oliver Cromwell massacred nearly 5,000 people in two Irish garrisons during 1649 for being both Royalists and Catholics.

In the wake of the Peace of Westphalia in 1648, intra-European wars began to lose their hard ideological edge, and wars were increasingly fought for commerce, empire, and dynastic succession. England sought to protect its growing trade through mercantilist policies first laid down in the Navigation Acts. Parliament backed these measures with military force, resulting in three Anglo-Dutch Wars (1652–1654, 1665–1667, 1672–1674) and the War of Jenkin's Ear (1739–1742). Britain's imperial wars originated with a series of dynastic power struggles in continental Europe that rapidly spread to North America. Colonists referred to the conflicts by the sitting monarch's name: thus, the War of the League of Augsburg/King William's War (1688–1697), the War of Spanish Succession/Queen Anne's War

(1702–1713), and the War of Austrian Succession/King George's War (1740–1748). Each of these wars led to raids against the English frontier settlements, which in turn provoked attempts by the English to capture Quebec and other French bases of operation in the Maritimes and Spanish St. Augustine in Florida. The Seven Years' War/French and Indian War (1754–1763) was unique because it started in the colonies over control of the Ohio River Valley and then expanded to Europe and around the globe.

The historian Wayne Lee notes that although Native Americans fought wars among themselves before the arrival of Europeans, warfare spiraled out of control thereafter. There were three main reasons for this. First, European and African diseases caused massive depopulation among Native American groups that lacked immunological defenses. While not all groups suffered at the same time or in the same proportions from these epidemics, these demographic disasters created a "shatter zone" that led to the destruction of existing tribes and the creation of new ones by the survivors. Second, European contact also undermined Native American political equilibrium by breaking down reciprocity. The introduction of capitalist markets violated reciprocity because European prices fluctuated and the Indians closest to the markets usually established monopolies and refused to redistribute goods equitably. Disparate European and indigenous martial cultures also subverted reciprocity and increased violence because neither side understood the other's rules of war, leading to atrocities and betrayals. Third, European weapons such as firearms and metal hatchets gave attackers tactical advantages thus making warfare deadlier and prompting preventative wars, thereby creating a feedback loop of mourning war.

Apocalyptic depopulation rapidly reversed the military balance of power in North America during the proprietary period, the first of the four phases of colonial warfare, which lasted from 1607 to 1688. During the First Anglo-Powhatan War (1609–1614), Powhatan's tribesmen numbered 24,000 and his warriors besieged Jamestown causing the infamous "starving times" that killed 110 of the 200 settlers and led to the English decision to abandon the colony; only the timely arrival of a relief fleet allowed the English to return. Opechancanough, Powhatan's brother and successor following the chief's death in 1618, initiated two Tidewater Wars (1622–1632, 1644–1646) with dramatic massacres. On March

22, 1622, Powhatan warriors slaughtered 347 of the 1,240 English colonists in Virginia. Their second assault killed nearly 500 in one day, but because the colony had grown to 14,000 this only amounted to 3.5% of the population. The demographic tide turned against the Powhatan, and they could no longer hope to drive out the English.

The other revolutionary change was the introduction of firearms and metal weapons because they increased the lethality of the battlefield and altered the balance of power between indigenous and European groups by instituting arms races. The Iroquois's campaign of annihilation against the Huron, Neutral, and Erie Indians between 1640 and 1660 clearly showed that European weapons enhanced offensive capability that, according to the historian Craig Keener, prompted Indians who possessed them to wage preventative wars against their neighbors before they acquired the weapons and nullified their advantages. Despite official prohibitions against selling firearms to Indians, the Hudson Bay Company traded 10,100 flintlocks to the Cree in upper Canada between 1670 and 1689, while the French in Louisiana traded a similar number in exchange for 100,000 furs in 1744. The historian Patrick Malone contends that the Indians learned to fix the weapons, make ammunition, and even blacksmith at a rudimentary level, but they never mastered the production of gunpowder. They were also savvy customers who readily saw the advantages of stealth and reliability offered by flintlocks over matchlocks and exclusively bartered for them while the English continued to employ matchlocks. King Philip's War (1675–1676) was the first colonial war where most of the Indian warriors opposing the English possessed flintlock firearms. Initially a reason for Philip's great success, this reliance on flintlocks contributed to his downfall when his supply of gunpowder ran out and the Mohawk prevented his warriors from resupplying at New York.

Considering the Native Americans' tactical expertise, access to firearms, and substantial, though rapidly declining, numbers during the proprietary period, it is not surprising that Anglo-Americans sought them out as allies. Through the famous "Covenant Chain" alliance, New York relied on the Mohawks to secure its northern flank against first its Indian and then French enemies. They also used that alliance to claim authority over the Mohawks' tributary tribes following King Philip's

War. Connecticut was the most successful recruiter of allied Indians during the proprietary period, while Massachusetts and Plymouth only tepidly enlisted Christianized Indians who lived at missions known as Praying Towns. Not only did Indian auxiliaries substantially augment the size and combat power of the forces that the colonies could field, but they also provided up-to-date strategic intelligence about the enemy's order of battle and intentions. Wayne Lee stresses how Native American pathfinders safely guided colonial forces to remote enemy hideouts and helped them strike deep into enemy territory by conducting independent raids. Although Anglo-American armies relied on Indian allies to perform these functions throughout the entire colonial period, their dependence on them was most acute during the proprietary period because the colonists had no alternative. There were too few rangers, and the militia did not train in light infantry tactics.

Another defining characteristic of colonial warfare that was imported from Europe during the proprietary period was the concept of "feed fights." Unable to force the Indians to fight on their terms, the English systematically targeted their crops instead, harvesting all that they could and destroying the rest. This method of strategic attack against the Indians' villages and other supply bases became a permanent feature of Anglo-American colonial warfare, and when combined with the irregular tactics of *petite guerre* (small war), constituted America's "first way of war" according to the historian John Grenier.

The scorched earth policies of the feed fights combined with two significant structural features of colonization in North America that pushed conflict toward total war during this initial phase of conflict. First, the English companies and land owners provided professional military leadership through mercenaries. Notable mercenaries such as John Smith in Virginia and John Mason, John Underhill, Lion Gardiner, Myles Standish, and John Endecott in New England all saw service in the Netherlands during the Eighty Years' War (1568–1648), which taught them the art of soldiering during one of the most brutal wars in European history. These soldiers understood the tenuous foothold their colonies had in America and justified their brutality toward the entire Indian population as a military necessity to ensure their settlements' survival. Second, the need to make the colonies economically viable encouraged the Anglo-Americans to seek ways of making

war profitable. While land acquisitions and control over trade networks helped offset the cost of war over time, Native American captives promised immediate reimbursement at slave auctions. Similar to their practices in Africa, the Anglo-Americans generally did not capture indigenous people themselves; instead, they relied on native people to bring the slaves to them in exchange for goods. Indian slavery became common practice in Virginia by the 1640s and in New England by the 1670s, but nowhere did it assume the importance it had in South Carolina: The historian Alan Gallay has estimated that South Carolina sold between 24,000 and 51,000 slaves to the northern colonies and West Indies between 1670 and 1715.

Cultural differences also pushed colonial conflicts closer to total wars because the adversaries did not understand each other's reasons and rules for fighting. This led to misunderstandings and attempts to enforce alien standards of behavior through terror. Both cultures also exhibited chauvinism, aggressive patriotism that blindly sought military glory, by exempting their new enemies from the traditional restraints placed on combat. The Anglo-Americans considered the Indians cowardly and ill disciplined because of their proclivity to retreat when outnumbered. The Europeans did not comprehend that retreating was part of the Indians' tactical doctrine to achieve victory by minimizing casualties and maximizing spiritual power through captives and booty. Europeans, on the other hand, defined victory in battle by maintaining possession of the field of battle. Their chivalric notions also permitted the parole of prisoners, thoroughly perplexing the Native Americans since they often waged war specifically to obtain captives. These unmanly and confounding behaviors confirmed the belligerents' sense of superiority and led them to dehumanize each other. Another cause of unrestrained violence by Europeans resulted from their inconsistent attitude regarding Native Americans' political sovereignty. Although Anglo-Americans acknowledged Indians' sovereignty by conducting diplomacy with them according to Indian protocols, Anglo-Americans simultaneously began to consider Native Americans as subjects of the British crown due to their refusal to adopt European culture. The consequence of this was that every war became a rebellion by traitors instead of legitimate belligerents; as rebels, the Indians fell outside the protections of the laws of war.

Proxy Wars

During the second phase of colonial warfare (1689–1753), the colonies became embroiled in proxy wars of larger European conflicts. Initially, the militias in North America were created via universal military service; however, changes in the social composition of the colonies and the diminished threat posed by Indians resulted in corresponding institutional modifications to the militia. By the 1660s, Virginia elites excluded slaves, indentured servants, and poor free-men from the militia because of perceived threats to internal stability. These fears proved prescient when Bacon's Rebellion erupted in 1676. These changes transformed the institution into what the historian William Shea calls a "bourgeoisie militia" dedicated to maintaining the status quo. New England and the Mid-Atlantic colonies had less disparity in wealth and a relatively small slave population compared with the South, which made them more socially cohesive and inclusive in their militias. While militia membership became a sociopolitical mark of respectability, the fighting capabilities of these organizations declined dramatically. Not only did they rely on a smaller core group, but their short-term, defensive nature made them useless for offensive campaigns that became increasingly necessary as New York, Massachusetts, and the western frontiers bore the brunt of the Anglo-French imperial struggles. To solve this problem, the colonies raised provincial volunteer armies. According to the historian Fred Anderson, the militia regiments served as the manpower pool for local authorities to raise a quota of troops. Because there were often too few volunteers, authorities encouraged enlistment with hefty bonuses subsidized by the Crown. If that failed, they resorted to drafting militiamen, but wealthy draftees usually hired substitutes to take their place. Although a provincial army captured the fortress of Louisbourg in 1745, their main contribution to Britain's success in the Anglo-French wars was as support troops and auxiliaries to the British Army and Royal Navy.

The third phase of colonial conflict, imperial warfare (1754–1763), witnessed a dramatic increase in the number of professional soldiers employed in the colonies. These "regular" troops made tactical adaptations and introduced hybrid units to cope with the difficulties of campaigning in the wilderness while facing both conventional and irregular

forces. The truly unique challenge posed by the vast North American continent was the incredible distances over which military campaigns took place. The British responded by creating a royally owned wagon corps, standardizing transport ship sizes, building roads, and erecting fortified magazines along the route of march that enhanced both security and speed because they reduced the size of the wagon train with the army and provided a safe fall-back point in case of an ambush. Contrary to popular belief, the historian Peter Russell maintains that European armies had extensive experience with guerrilla warfare by the 1760s. The major tactical innovations reflected the decision to introduce anti-guerrilla tactics to regular troops that concentrated on scouting, skirmishing, and protecting the flanks in addition to arming them with specialized equipment such as carbine rifles. The British also formed a light infantry battalion of regular troops in 1757. Although Virginia created the first ranger unit in 1645, the British military first employed them on a vast scale during the Seven Years' War, thus overcoming their shortage of Native American allies by providing strategic intelligence and a deep-strike capability exemplified by Major Robert Rogers's 1759 assault on the Abenaki Indian village of St. Francis.

Policing an Empire

Constabulary operations characterized the final phase of colonial warfare from 1763 to 1774. Despite previous rebellions against British authority in the American colonies, the revolts by both settlers and Indians that occurred after the conclusion of the Seven Years' War demonstrated Britain's inability to successfully govern its vast conquered territory even with the absence of any imperial rivals. The Anglo-French imperial wars created new group identities that prompted people to challenge imperial authority and ultimately eroded any allegiance they had to the empire. Pontiac's War (1763–1766) and the Stamp Act Riots (1765) demonstrated this trend. Pontiac's War resulted from Britain's failure to honor the Treaty of Easton (1758), which secured the neutrality of the Ohio Valley tribes and forced the French to abandon and destroy Fort Duquesne without a fight, in return for a British promise not to settle in the region. The British government's decision to build Fort Pitt on the site and its failure to

prevent squatters from settling on Indian lands were major sources of contention. The historian Gregory Dowd avers that an “Indian Great Awakening” that fostered a Pan-Indian identity and stressed the need for spiritual purity and united action to turn back the encroaching Anglo-Americans was equally important. Pontiac, an Ottawa chief, led a coalition of Seneca, Mingo, Delaware, Shawnee, Wyandot, Miami, Ottawa, and others that attacked and captured 10 of the 13 British forts in the Ohio River Valley. Despite these initial successes, the war eventually became a stalemate because the Indians lacked artillery to capture vigilant, well-supplied garrisons, while the British suffered from a debt-burdened and dramatically smaller peacetime army that could not bring Pontiac’s warriors to battle on favorable terms. Pontiac’s War led to an accommodation rather than a military defeat for the Indians.

The troubles on the frontier and the diminutive size of the army following the Seven Years’ War also contributed to the Stamp Act Riots. Parliament passed the Stamp Act to raise revenue to offset the cost of the troops in America. When a year of riots and resistance broke out against the measure, the few British troops in the colonies were policing the frontier and were therefore unable to protect the officials charged with enforcing the Stamp Act. The violence directed against royal officials and significant economic impact of the Nonimportation Agreements forced the Grenville Ministry to back down and repeal the act. The ability of the Committees of Correspondence to coordinate resistance throughout the colonies demonstrated the growing recognition of an American identity with interests different from those of Great Britain. When Redcoats garrisoned troublesome cities following the disturbances, they simply exacerbated tensions by competing in tight job markets, quartering themselves on the inhabitants, committing crimes, and serving as a tangible reminder of the arbitrary power of Parliament.

Conclusion

Between 1607 and 1774, Anglo-American colonial warfare went through four distinct stages: (1) proprietary warfare (1607–1688), (2) proxy war (1689–1753), (3) imperial warfare (1754–1763), and (4) constabulary operations (1763–1774). During the course of these phases, warfare between Native Americans and Europeans became more lethal and

persistent as a result of depopulation, competition over trade, new technologies, political power vacuums, and the lack of reciprocity among the military cultures. The crucible of colonial warfare formed Pan-Indian and American nationalist identities that tore the First British Empire asunder by 1783.

COMBAT, PHYSICAL AND PSYCHOLOGICAL IMPACT

Military historians have debated whether those who write of combat should have had experience fighting on the battlefield. The British author John Keegan questioned whether he could write and teach about it, or even make reference to it, since he had never been in combat. So the issue of what it is like to kill with a gun, stab with a bayonet, strangle with hands, or use weapons of great lethality such as artillery and hand grenades has perplexed scholars for many years. This entry explores what we know about the act of killing, how it affects the soldier physically and psychologically, and the costs of such activity on the individual and on the society that sent him or her into combat.

Background

Film, video games, and television present the act of killing in antiseptic and often romantic ways, providing the viewer with a sense of satisfaction that the behavior is easy, methodical, and rational. According to those who have studied and written about organized killing, as in combat, nothing could be further from the truth.

The historian S. L. A. Marshall studied the responses of soldiers being ordered to kill in World War II. His findings, criticized by the military and by those who were familiar with warfare, indicated that only 15% to 20% of soldiers whose job it was to kill actually fired their weapons. Even if his methodology and results were flawed and he was wrong by a factor of 100%, nearly half of all soldiers expected to fight did not fire their weapons. Marshall concluded that teaching men, and more recently women, to kill

is a difficult task, and one that nations struggle to achieve. It is not a natural instinct to kill, although defending oneself from harm is natural.

Marshall's study was based on World War II soldiers, but there is evidence of "non-firers" throughout modern warfare. Once the gun replaced the sword as the primary weapon of the soldier, distance replaced close contact, and secrecy of action became possible. As weaponry changed, allowing more opportunity to avoid accuracy in firing a weapon, soldiers were able not only to avoid killing but also to question whether it was their bullet that killed the enemy. As fire and maneuver replaced linear warfare, which had been the way of combat even into the 20th century, a soldier's failure to fire became more obvious to his "buddies" because he was frequently isolated in his combat role. Military trainers had to change the way they taught killing to allow for this fear.

Physical Impact

Marshall's study was first reported as America prepared to go to war in Korea. While the weaponry did not change significantly from World War II, the way that soldiers were organized to fight changed because psychologists and sociologists had begun to recognize the need for men to not be isolated from their primary group when engaging the enemy. If their operation was platoon-size, then soldiers would be placed into positions where squads had firing lanes assigned to them that kept each unit in constant contact with each other. No soldier ever felt isolated from the primary group, which allowed him to have access to the physical and mental support that he needed to function efficiently.

In preparation for jungle warfare that would be required in Vietnam, the military developed a light, plastic, almost "toylike" weapon—the M-16A1, which seemed to be more comfortable to soldiers who had never fired a gun. It could also be used to lay down a significant amount of firepower when placed on fully automatic, firing 20 rounds in slightly more than 1 second. Subsequent studies on soldiers firing their weapons in Vietnam indicated that more than 95% performed their responsibilities efficiently, unlike those that Marshall purportedly found in World War II studies. Although the weapon was criticized by many soldiers because of its propensity to jam in the humidity and wet climate of Vietnam,

it was easier to teach a soldier to use the M-16A1 than its World War II predecessor, the M-1 Garand.

Military planners have struggled with how to train soldiers for the next war, since asymmetric warfare appears to be more likely in the future. Thus, America's wars will usually be focused on small nations or insurgencies within those nations where the belligerents are not evenly matched, and where the local guerrilla forces use unconventional methods and weapons to achieve their goals. After Korea, there was an attempt to drop bayonet and hand-to-hand combat training from basic training schedules because future wars would be fought from a distance, not requiring the close engagement of the enemy. But in the first major battle of the Vietnam War, the People's Army of Vietnam troops engaged U.S. Army soldiers at the Ia Drang Valley in both bayonet and hand-to-hand combat. Lieutenant Colonel Hal Moore wrote in his after-action report that American soldiers had a distinct advantage over their smaller Vietnamese adversary and that training to take advantage of such a size differential was critical to future success on the battlefield.

Psychological Impact

Physical attributes are important to combat success, and training to maximize the advantages of physical characteristics is a major part of military manuals, but the psychological impact of killing is equally important. Psychologists now agree that the lack of unit cohesion in Vietnam was caused by soldiers being sent to the theater as replacements; thus, combat-experienced soldiers never embraced them as their "buddies." Without individuals feeling responsible for each other's well-being, the unit never functioned as a primary group and was therefore less efficient on the battlefield. The early successes in Vietnam at such battles as the Ia Drang Valley were never replicated because the policy of training as units in the states was eliminated in favor of the more expedient replacement policy. Unit cohesion diminished, and psychological trauma manifested itself at every level.

In the current wars, the military has recognized the mistakes of Vietnam and has improved the efforts toward unit cohesion. Soldiers are sent as replacements before the unit is trained for combat, thus creating a feeling of obligation in each individual prior

to deploying to the theater. However, being dedicated to your buddy can also have deleterious effects when casualties occur. The psychiatrist Jonathon Shay writes about the "berserk state" of soldiers in battle, which often leads to death or injury. When a buddy is wounded, a physiological and psychological event takes place in all of the soldiers who witness the action, and they are changed forever. Their response to this event may be immediate and result in an effective use of force to repel the enemy, or it may linger for years and return in the form of posttraumatic stress disorder (PTSD). How a soldier responds can even be affected by the nature of the death.

An issue that affects soldiers psychologically, which developed in Vietnam and has continued into the wars of the 21st century, involves how soldiers are killed or wounded. During the Vietnam War, more than 30% of all casualties resulted from encountering enemy mines and booby-traps. Thus, soldiers were likely to see their buddies fall without seeing the enemy who had inflicted the wound. The psychological impact of such an event was devastating, because the surviving soldiers had no chance to take action against those who had harmed their fellow soldier. "Payback" or revenge killing is an automatic response in combat, and it can be therapeutic if managed properly by commanders. However, if institutionalized improperly, as evidenced at My Lai in Vietnam, a complete breakdown in military discipline can occur and atrocious behavior can result. In the wars of the 21st century, the number of casualties from what are now referred to as improvised explosive devices is more than 70%. This casualty rate has now affected all military operations because even those who are not combat soldiers are becoming casualties of an unseen enemy. This "killing from a distance" has also created a fear among soldiers that the enemy can inflict harm even when he cannot be seen. The battlefield therefore has no limits, and thus there is no longer a particular Military Occupational Specialty that engages the enemy more often than others. Those who traditionally did so—infantry, armor, artillery—still seek the enemy, but those who provide combat support such as transportation and maintenance are now subjected to combat on the roads of Afghanistan, and previously, Iraq. The enemy is thus anywhere and everywhere, and safe zones are not always available.

Posttraumatic Stress Disorder

Psychological trauma from combat exposure not only affects performance on the battlefield but also is affecting the opportunity to return soldiers to the war. PTSD has been recognized for most of the 20th century, having been recognized after World War I and World War II as “shell-shock.” It was identified after the Vietnam War as caused not only by combat experiences but also by external forces not readily apparent to the soldier and the soldier’s family. Those returning from Vietnam were affected not only by the combat they experienced but by a society that did not understand why they allowed themselves to be drafted. College campuses erupted in riots and Reserve Officer’s Training Corps buildings were fire-bombed in the aftermath of the U.S. escalation into Cambodia in May 1970. Soldiers returning to America during this period were subjected to ridicule and shouts of being “baby-killers” and were criticized for not being more vigilant in avoiding the draft. This attitude by a soldier’s own age-group caused many to shrink into oblivion, avoid large crowds, and to withdraw from society. Many never recovered, and some Vietnam veterans are being diagnosed with PTSD nearly 40 years after having served in combat.

The situation for current veterans has improved, at least from the view of the society to which they are returning, but the needs of the military are now so critical that a new problem exists. In the wars of the 21st century, soldiers are being sent back into combat on multiple tours, on 1-year intervals. Those with diagnosed PTSD are treated while stateside, and then they are often sent back to the combat zone. The soldier will be supported by his or her unit, and the combat experience is considered part of therapy. PTSD is a significant problem in the aftermath of combat experiences, and very few remedies are available. As previously discussed, the work of Dr. Jonathon Shay with PTSD victims of the Vietnam War has been instrumental in addressing these issues.

With only 10% to 20% of soldiers in a war zone ever experiencing combat, what we know about their psychological and physiological problems is challenging. Psychiatrists and psychologists are beginning to study combat trauma more frequently as the battlefield changes in modern wars. Killing through the use of drones, artillery, and aerial bombardment will provide space between the killer and

the target, thus perhaps providing a different degree of concern to the soldier. But societies must still deal with the returning veterans’ behavior that has been affected by their wartime experiences. These issues are as important to a nation’s military preparedness as are training and weaponry.

COMBAT LOAD

By definition, combat load is the minimum gear that a soldier must carry into battle. It includes items that are worn, carried in a rucksack, and/or strapped on a belt or fanny pack. The soldier’s rucksack is filled with rations, water, personal belongings, firearms, and any number of odd items as Tim O’Brien eloquently wrote in his 1990 book “*The Things They Carried*.” Most items are necessities for battle, while others are included because of sentiment or superstition.

History

Soldiers have long been expected to carry a heavy load, whether what they carry is dictated by their

commanding officer or by their own desire to be prepared for extended combat. The historian S. L. A. Marshall observed that soldiers historically have been asked to carry too much and are often overburdened by their load. Combat loads traditionally include everything from extra socks, a ready-to-eat meal, and a blanket, to a gas mask, weaponry, and ammunition. At the same time, soldiers, especially inexperienced ones, often carried an extra unauthorized weapon, as well as extra ammunition for a sense of security. Others carry Bibles, books, or sentimental objects from home that further increase their burden.

Once deployed in battle, soldiers often quickly discarded items from their rucksack to lighten their load. In World War I, soldiers were known to bury their discarded items and carry only their guns, clothes, and an overcoat. Many World War II soldiers who landed in France for the Normandy Invasion struggled to get ashore and risked drowning because of the weight of their packs. On the march, G.I.'s quickly learned to lighten their load by discarding unneeded items; gas masks were among the first items discarded. Loads continued to weigh down soldiers in Korea and in Vietnam, particularly in the latter conflict as troops had the added burden of marching in the damp, musty jungle.

The Contemporary Period

Surprisingly, in the 21st century, loads continue to grow in both size and weight, despite advances in technology and the availability of lighter materials. In fact, because of advances in technology and the advent of smaller and more compact supplies, as well as ergonomically designed packs, soldiers are able to carry more items into battle.

Combat load in the wars in Afghanistan and Iraq refers to the minimum mission-essential equipment a soldier must carry to execute a mission. It includes items a soldier needs to fight and survive. Combat loads fall into three distinct categories—fighting load, approach march load, and emergency load—and are determined by a unit's commanding officer. Fighting load includes weaponry, clothing, load-bearing equipment, and minimal ammunition. The load should be as light as possible to enhance a soldier's ability to move stealthily; the load is currently limited to 48 pounds.

Approach march load can weigh no more than 72 pounds and includes clothing, weaponry, assault pack, and enough equipment and munitions for fighting until resupply is available. These limits are often exceeded during an emergency approach. In this circumstance, soldiers must carry additional items if the approach is impassable to vehicles. A soldier can carry loads of 120 to 150 pounds, but such a burden is not feasible for more than a day or two and can often cause fatigue and injury.

The U.S. military has designed a special rucksack, the Modular Lightweight Load Carrying Equipment pack, better known as a MOLLE (pronounced Molly) to help lighten soldiers' loads. It is designed with modular webbing that allows the soldier to attach compatible pouches and accessories. Soldiers typically carry items they would need to survive for 72 hours in the wilderness. These items include food (MREs—meals ready to eat), snacks, and extra water (a hydration bladder) in addition to their water canteens. They also carry sunscreen, first aid kits, medication, fire suppression and fire starters, extra socks, sunglasses, a flashlight, and a sleeping bag. A soldier must also carry personal protective equipment, whether in his sack or on his back. In addition, the MOLLE contains a claymore antipersonnel mine, a bandolier of ammunition, and a knife. Other survival items include a tactical radio, a Global Positioning Systems unit, a satellite phone, a cellular phone, and possibly even a laptop. Depending on their position, every soldier or marine carries a different load based on the equipment needed for his job. Of course, a soldier often chooses to carry personal items, including photographs, reading material, Bible, mementos, and many other items.

Both the army and the marines recommend that rucksacks weigh no more than 48 pounds; most soldiers, however, routinely carry 95 pounds or more. World War I and World War II soldiers were burdened with packs weighing 70 pounds and more, weighing them down and slowing them down. Vietnam soldiers saw no relief, and the military in Afghanistan and Iraq are carrying packs up to 140 pounds. Military leaders continue to create lighter weight items and containers, offering better comfort with more ergonomic load capacity, but even these innovations have not lightened the load of the "grunt."

Marines with Charlie Company, 7th Engineer Support Battalion, 1st Marine Logistics Group, hike at Camp Pendleton, California, November 15. The marines hiked 6 miles with their combat gear in an effort to keep themselves prepared for any future combat operations.

A combat load for a rifle squad leader in Afghanistan may include the following:

Equipment Common to Rifle Squad Leaders

A. Equipment Worn on the Body or Uniform

M4 carbine with PEQ-2 laser/PAQ-4 laser, ACOG/CCO, and 30 rounds of 5.56-mm ball ammunition

Desert camouflage uniform with infrared tape on left sleeve (1 inch × 1 inch)

Desert combat boots

Dog tags

ID card

Undershirt

Socks

Tactical gloves

Interceptor body armor with two small arms protective inserts

Advanced combat helmet with night vision mounting plate

Rigger belt

Notebook and pen

Watch

Knee and elbow pads

Sun, sand, and dust type goggles or Wiley-X goggles

Folding knife/multi-tool

B. Equipment Worn on Fighting Load Carrier/Interceptor Body Armor

MOLLE Fighting Load Carrier with modular MOLLE pouches
 180 rounds of 5.56-millimeter ball ammunition
 Bayonet
 Fragmentation grenade
 64 ounces of water in two 1-quart canteens
 100 ounces of water in a hydration bladder
 Casualty and witness cards
 Flex cuffs for personnel under custody
 Night vision equipment (PVS-14/PVS-7)
 Iodine tablets
 Lensatic compass
 Flashlight
 Chemlight
 First aid dressing and pouch
 Canteen cup
 Earplugs
 Internal communications radio

C. Carried in Assault Rucksack

MOLLE assault rucksack or commercial assault rucksack, with MOLLE attachments
 500-milliliter intravenous fluids bag with starter kit
 70 ounces of water in a second hydration bladder
 Two meals, ready to eat (MREs)
 Poncho and/or bivy sack
 Poncho liner
 Undershirt
 Spare batteries
 Two pairs of socks
 Polypropylene or silk long sleeve undershirt
 M4/M16 rifle cleaning kit
 Personal hygiene kit
 Rubber gloves
 Sling rope with two snap links

D. Carried in Main Rucksack

MOLLE main rucksack with sleeping bag carrier or Large ALICE rucksack
 Modular sleeping bag (one bag per two men)
 Long polypropylene underwear of fleece jacket and bibs
 Two undershirts
 Two pairs of socks
 Cold weather gloves
 Knit/fleece cap
 Additional ammunition
 Two meals, ready to eat (MREs)
 Sleeping pad

Special Equipment (Letters indicate where items are carried and refer to the lists above)

Map (A)
 Aerial photographs (A)
 Whistle (B)
 Concussion grenade (B)
 Smoke grenade (B)
 Incendiary grenade (B)
 Global positioning system (B)
 Lock pick (B)
 Collapsible riot baton (B)
 Infrared strobe light (B)
 Bolt cutters (C or D)
 Metal detecting wand (C or D)
 60mm mortar round (C or D)
 Star cluster (C or D)
 VS-17 panel (C or D)
 Ground control laser pointer

Average Mission Duration = 48 to 72 hours

Resupply Items: Soldiers were resupplied with 2 to 3 MREs per day and up to 8 liters of water per day.

Table 1 Average Rifle Squad Leader Statistics

	Average Load (Pounds)	Average % Body Weight
Fighting load (A, B) ¹	62.43	34.90
Approach march load (A, B, C)	94.98	52.59
Emergency approach march load (A, B, C, D)	128.35	73.62

Source: From <http://www.thedonovan.com/archives/modernwarriorload/ModernWarriorsCombatLoadReport.pdf>.

¹A, B, C, and D refer to the above lists of equipment carried.

When under fire, soldiers could expect a resupply of their basic load of ammunition each day.

COMBAT POWER

The concept of combat power is as old as war, though its meaning and purpose have varied somewhat through time. Generally, combat power is the abstract measurement of the destructive power a unit is capable of generating at a given time and place, against a specific enemy in a specific environment. In other words, combat power cannot be

measured in absolute terms but is an assessment of the relative capabilities of opposing forces.

Elements of Combat Power

Combat power contains several key elements, the most important of which is leadership. Does a unit or army have competent officers and noncommissioned officers who not only possess the will to win, but who can provide encouragement and purposeful direction in combat? Without effective leadership on the battlefield and behind the scenes, superior weaponry, technology, and manpower resources will not be used to their best advantage. Additionally, these leaders must continuously monitor the combat forces of their own and opposing units to inform decision making. Napoleon Bonaparte's actions at the Battle of Rivoli provide an excellent example of leadership enhancing combat power. There, he asked a subordinate commander defending one avenue of the enemy's approach to provide him with an estimate of the enemy's numbers so that he could determine whether or not a main attack was imminent and if so at what point on the line it might occur. By determining his foe's combat power and potential plans, Napoleon increased his own combat power by making adjustments to the placement of his own troops.

Effective maneuver is another significant aspect of combat power. The effective maneuvering of guns and men can both enhance the advantages of a particular force and help minimize its disadvantages in combat. By making use of the topography and terrain, such as staking out the high ground or incorporating natural barriers into its defense, and positioning weapons to deliver a maximum of destructiveness to the enemy, a smaller force might effectively fight a much larger one. Also, by employing the elements of surprise and psychological shock, units can increase

their combat power. The marines caught at Chosin Reservoir in Korea in late fall 1950 demonstrate the use of effective maneuver. Surrounded and greatly outnumbered by Chinese troops, the marine commander O. P. Smith, in stark contrast to the army leader General Edward Almond, managed to implement an orderly withdrawal of both marines and equipment by carefully positioning battalions so that they could leapfrog southward to safety.

Firepower necessarily also contributes to combat power by providing the main source of destructive force. Consisting of both weaponry designed to kill the enemy and smoke to obscure movements and cause disruption, firepower gives combatants the means to destroy enemy troops and materiel as well as to defeat the enemy's desire to fight.

The last component of combat power is protection. To maintain efficiency, morale, and unit cohesion, military leaders must strive to provide and maintain the protection of both the operation and the troops. This protection consists of everything from providing operational security whereby reconnaissance and counterreconnaissance prevent the enemy from locating and harming units and headquarters to keeping soldiers healthy in both body and morale through both training and combat to preventing incidents of friendly fire.

Combat Power in the Contemporary Period

While the general meaning of combat power has changed little throughout the years, the U.S. military has altered its specific definitions of the term. During the Cold War years, the United States Military Academy taught future army officers that combat power could only be measured in relation to a specific enemy and that combat power could be increased by finding more effective means to employ it, such as surprise attacks or using geographical advantages. After 9/11, however, in the wake of army and marine counterinsurgency operations in Iraq and Afghanistan, the military began to reassess the meaning of combat power, determining that a broader interpretation better suited current circumstances. Thus, in response to this new operational environment, a new meaning evolved, essentially redefining combat power as the total capability of a military unit to apply force, whether through destructive, constructive, or informational means. In other words, the military began to attempt to measure the total power of a unit or

formation, its ability to convert potential power to effective action without regard to a specific enemy's combat power.

This more recent definition of combat power reflects the understanding that destroying the enemy is not always enough to achieve political objectives in foreign lands. It is sometimes necessary to gain and maintain the support of the populace. Construction and information operations are thus mission essential tasks in counterinsurgency operations. FM 3-0, *Operations 2008*, a Joint Publication of the army and marines, devotes an entire chapter to the subject of combat power, largely focusing on the aforementioned key elements as well as information operations, intelligence, logistics, sustainment, and command and control. Yet this definition is incomplete and deeply flawed.

Combat power is not simply an operational and tactical concept. It is also a strategic concept. At the strategic level, the objectives are not simply the destruction of the enemy's forces but can also include the elimination of ideologies such as Nazism, communism, and Islamic fundamentalism. To this end, combat power can include the establishment of stable, democratic governments, such as the objectives of the United States in Operations Iraqi Freedom and Enduring Freedom in Afghanistan. It can be the establishment of sustainable economic systems. To achieve these types of strategic objectives, combat units may not be the most important types of units. Engineer units, medical units, transportation units, and other governmental and nongovernmental organizations and agencies can be more effective at generating the specific types of combat power necessary to achieve political objectives. An engineer unit that constructs a bridge or power plant, or a provincial reconstruction team that stabilizes and advances the economy in a developing, war-torn country can produce the specific type of combat power necessary to destroy an ideology. Without these, insurgents or terrorists hold on to the power of the people. Thus, noncombat units and civilian organizations produce and maintain "constructive" combat power, an element not recognized by the more recent definition of combat power. Broadly understood, then, combat power is not just generated by combat units. The words of a ground force commander or a president or the actions of noncombat units can, under the right circumstances, generate more combat power than an armor division. In the modern world, combat power

is not merely the ability to decimate an enemy, but it is the power required to achieve political objectives.

COMBINED ARMS

Combined arms is the summoning of and coordination of all military, kinetic means at a commander's disposal to inflict damage and destruction on an enemy force in the field. Such close coordination of arms—which may include force applied from the air, land, and sea—provides maximum destructive effect at the time and place of a commander's choosing. This combined arms effort is a tactical-level exercise of arms to achieve theater-level goals in pursuit of a national strategic endstate.

Combined arms can make a relatively light and small force more powerful than would shock and mass otherwise and does so by inflicting damage at points of enemy weakness. Such coordinated effects are a basis for maximizing the kinetic effects of warfare and serve as a foundation for battles as small as one man versus another up to engagements involving millions under arms. This entry discusses the three levels of warfare, innovations in technology

that led to more effective warfare, and the close coordination and integration of all available assets.

Tactics Follow Technology

Through the history of warfare, military units have used all means at their disposal to accomplish the mission they have at hand and to further achieve the endstate of the government that fields them. Tactics follow technology, and as technology advances, so does the destructive power of a military force and the ways in which that technology is employed. Military technology moves mostly in a stepwise and incremental fashion but then can make sudden leaps that in turn drive changes in combined arms application.

Warfare exists at three levels. The highest level is the strategic level, at which nations move against one another. The goal for this level will be the national strategic endstate: the overarching goal to which all aspects of national power are brought to bear. Next is the operational level, which can be thought of as the theater level of war with a three- or four-star commander. The lowest level is that of tactics, where the application of arms is employed down to the individual. Combined arms is a coordination and a synthesis of military techniques and weapons at the tactical level.

The basic element of warfare is the infantry. Infantry are ground force fighters sent to kill other ground force combatants. Combat between early men consisted of hand-to-hand fights to the death and at its most basic has not changed. The advent of weaponry was with whatever was at hand, such as stones and clubs, and proceeded to spears and shields. Thrown spears beget arrows and the bows to propel them. The handheld bow in turn evolved to crossbows, longbows, and footbows, allowing a force to inflict violence from ever-greater and safer distances.

It also led to two changes in tactics. First, rather than man-to-man battles at hand-to-hand distances, leaders could employ archers from “stand-off” distance, well behind their infantry ranks. These archers could stand off at a distance and loft arrows in an arc across the battlefield, over the heads of men in hand-to-hand combat and deep into the enemy's rear. This is the dawn of what is now called “indirect fire,” referring to ballistic weapons propelled into the sky that fly in an arc and land well in front of advancing friendly forces. The Battle of Crecy in 1346 is

regarded as the inflection point, at which point the longbow became dominant over the crossbow and forces in conflict could begin to move apart.

A second innovation was the stirrup, which allowed a man to stand while his horse was at full gallop and to deliver an arrow from this moving platform. Thus were two new tactics merged: the advent of the bow and the stirrup led to the beginnings of cavalry forces. Speed, range, shock, and tempo were introduced to the battlefield as variables that a commander could leverage; no longer did he simply have to have more people than did his opponent.

Genghis Khan, the legendary leader of the Mongols, grew his nomadic tribe into a 13th-century empire through precise application of military force where it was needed and savvy combined use of the weapons and tactics at his disposal. Using combined arms and emphasizing speed, shock, and tempo over raw numbers, the Mongols changed the face of war. Their horses, for example, were bred to run all day with a stiff, short gallop and eat very little and drink even less. Such an animal was the perfect transportation—the “vehicle” technology of the day—for swift-moving cavalry on the dry steppes of northern Asia. Employing composite bows and heavy cavalry, the Mongols dominated the warfare of the time. At the height of the Mongols’ power and reach, the mere appearance of their horsemen on the horizon was often enough to compel a city’s surrender.

Fires

As people moved forward in industrial technology, warfare followed suit. With the advent of iron and gunpowder came the cannon, big guns by which to propel ordnance forward across great distances. Cannon first deployed simple iron balls, which though hugely destructive were inaccurate due to uncertain ballistics. Innovation then led to explosives that could be packaged inside these balls and yield greater destructive power from the same weapon.

Gunpowder also enabled the musket, the original firearm. A musket is considered a “direct-fire” weapon, one that is aimed directly at a target and fires a very small round (a bullet) in a straight line at very high speed. Direct-fire weapons quickly became the weapon of choice for arming individuals to kill other individuals, known as “point targets.” For “area targets”—that is, groups of people or materiel spread across a large area—indirect-fire weapons

lofted large and deadly ordnance high into the air, up and over infantry forces in the same way arrows had been employed centuries before.

Alloys came next, with steel the metal of choice in weapons development. Precision machining then led to rifling of barrels for both cannon and musket, the next leap in technology. Rifling means carving inside a barrel a set of spiraled grooves that, when the projectile is propelled by a charge and gains speed through the barrel, impart a spin to the round. This spin, through gyroscopic physics, makes that round vastly more accurate. Now men could hit what they were aiming at.

This rotation of the projectile also led to projectiles’ elongations into what is now the common teardrop bullet shape. New barrels, new rounds, and more powerful powder led to a dramatic leap in distance and accuracy of rounds. This accuracy extended to direct-fire weapons, as muskets evolved into rifles, and to indirect-fire cannon (which became known as field artillery) and mortars, which are simply smaller indirect fire pieces.

At the turn of the 20th century, the increased lethality of rounds, combined with Richard Gatling’s and Hiram Maxim’s invention of machine guns after the American Civil War, introduced the era of modern, mechanized warfare. The First World War is a crystalline example of what happens when tactics do not follow technology, as human waves of men, attacking as if against musket-loading foes of the U.S. Civil War, ran headlong across open fields into modern machine guns and were slaughtered by the millions. This is the opposite of combined arms and is called attrition warfare, wherein a larger force simply grinds down a smaller force. Attrition warfare is contrasted with maneuver warfare, wherein a military force uses combined arms and speed, surprise, deception, shock, and battlefield tempo to defeat a foe with minimal casualties.

Tactics in World War I did not keep pace with advances in technology, and rather than *coordinating* and *combining* indirect fire and direct fire, commanders used each *individually* and *in sequence*, leading to massive casualties on both sides and to battlefield stalemate.

Fires From the Sky

The advent of the airplane in the early 1900s had immediate military implications. Biplanes were

used during World War I for not only observation and spotting for indirect-fire weapons but actually as primitive offensive weapons, with pilots shooting or dropping ordnance from their cockpits. Aircraft technology moved swiftly from the 1920s to the 1940s and World War II: Aircraft propulsion evolved from small reciprocating engines to powerful rotary engines, though aircraft were still powered by propellers, and then made the leap to the jet age in the late 1940s. Senior leaders, many veterans of the horrors of the World War I trenches, for the first time coordinated aircraft attacks with ground movement, and when these two were combined with indirect fire, these became true combined arms.

The Korean War signaled the dawn of the helicopter, first used as a method of moving personnel and equipment around the battlefield. The commander now had another tool in his combined arms kit. Korea also marked the intersection of the jet age with military campaigning, as a quantum leap in jet speed, range, altitude, and carrying capacity changed the face of war. Now to direct and indirect fire was added air-delivered fires. Such fires include strafing, or shooting bullets from a moving aircraft; bombing, which is generally conducted from higher altitudes and involves dropping gravity-guided munitions; and attacking with high-speed forward-firing ordnance, guided or unguided, including rockets and missiles.

The coordination of such aircraft is called “close air support,” defined as the terminal guidance of aircraft-delivered weaponry in coordination with friendly forces. The goal of close air support is to protect friendly forces from air-delivered fire while maximizing fire effects on the enemy. Air-delivered fires can come from jets or helicopters, at altitudes from a few dozen feet to many miles in the air. Combined arms includes these fires.

Coordination and Control

It is the close coordination of these disparate means of violence—a man carrying a rifle, the mortar firing next to him, the artillery piece far to his rear shooting over his head, the airplane circling and ready to drop a bomb in front of him, the ship lobbing in rounds from offshore—that is the crux of combined arms. The battlefield commander combines his assets for the execution of a coordinated goal. He must have close control over all these means of

destruction to apply them to his enemy while protecting his forces. Artillery rounds must explode at the right place and time. The pilot needs to know where that round is in the sky. The leader on the ground needs to know when and where that round will land, to move up an attacking force or to capitalize on a dazed or wounded enemy force.

Training of and communication between those employing these weapons are critically important to combined arms success. Combined arms relies on a coordinator on the ground, moving with ground forces, who has a close look at the battlefield and is invested in the ground commander’s scheme of maneuver, immediate mission, and long-term commander’s intent. Together they work toward goals handed down from the theater and strategic levels.

The summoning and application of fires—indirect or direct; air or ground delivered—is the responsibility of a fire support coordinator. He may be assisted by a forward air controller, an aviation liaison officer, or a joint tactical air controller, or some combination of these. Together with infantry force commanders, these officers provide minute-by-minute combined arms coordination, ensuring that fires are synthesized and deconflicted between and among friendly units.

Robust close air support combined with tight integration of direct and indirect fires can protect even an overmatched ground force, can extricate a losing army from destruction, and can generate a high-tempo operation to which an enemy cannot react. The tight and smooth integration of this lethality, known as combined arms, is the hallmark of the sophisticated modern field army.

Modern War

The wars in Iraq and Afghanistan have proven the necessity of a thorough grounding of force’s in the art of combined arms. The 2003–2011 war in Iraq, Operation Iraqi Freedom, matched large American units against, first, large Iraqi units and, later, against Iraqi insurgent forces. This most modern warfare required American and allied forces to be nimble and flexible and to be prepared to operate in any environment from wide-open desert to very narrow and confined city defiles.

The war in Afghanistan, Operation Enduring Freedom, has never presented Western forces with large enemy units, forcing them instead into giving

battle often at the time and place of the enemy force's choosing. This enemy force—usually Taliban, al Qaeda, foreign jihadi fighters, or a combination of these—coalesces and disperses seemingly at random and has often forced U.S. forces to improvise and execute their operations down at the very smallest unit levels.

As part of this sort of warfare in these two countries, U.S. commanders have had to master all the supporting arms at their disposal. Whether fighting Iraqi line units in the open desert or in cities, or fighting insurgent forces in Afghanistan or Iraq, combat took place at the tactical level with implications upward to the operational and strategic levels. The precision and lethality of modern weaponry presented a double-edged sword: U.S. controllers could kill enemy forces very quickly and efficiently, but the weapons delivered by indirect or airborne means were often exceptionally powerful and in exploding could easily injure or kill innocents. Winning an insurgency means controlling both military initiative and political power, and killing Afghan or Iraqi civilians meant playing into the enemies' narrative. Combined arms can negate this problem, as by summoning and controlling with precision the kinetic means at his disposal, the ground commander can both eliminate threats to his force and preserve innocent life.

In the vast and wide-open spaces of the battlefield of Afghanistan, combined arms are even more important. Western forces in Enduring Freedom are by necessity dispersed, operating from forward operating bases and often pursuing enemy fighters into the mountains. These dispersed forces often cannot mass infantry power or small arms quickly enough to defeat a light, quick-moving insurgent force but can summon fires from the air or from indirect means to destroy such a force once it is pinpointed.

An insurgency by its nature does not present a large target, so combined arms in modern warfare often means maximizing the precision and destructive force of airborne or indirect means: a kinetic event to produce a psychological result. Killing an enemy leader without harming innocents behind whom he hides, and killing him seemingly by magic at night or in bad weather and with no American forces nearby, gives the American ground commander a tactical and operational—as well as psychological—advantage. He regains the initiative from an insurgent force through the use of all the

means at his disposal. This is the essence of the art of combined arms.

COMMAND AND CONTROL

All organizations require some form of direction and focus to achieve their goals and fulfill their purpose. The reason for this is straightforward; organizations are composed of people, and people have their own ideas about what they ought to do. Direction and focus within the organization's structure avoid the chaos of individual agendas within an organization. *Someone* or some entity in the organization needs to decide what to do, when to do it, where to do it, and how to do it. Thus, musical orchestras need conductors; schools need principals or superintendents; corporations need chief executive officers. That entity, whether identified as a person or a group, uses information to make the direction and focus real. Generally, the function of direction is called leadership, an exquisitely human idea; the function of focus is called control. Leaders can be understood to manage or structure the *flow* of information in organizations in pursuit of organizational goals and to focus individuals within the organization to effectively work toward those goals. This entry discusses the development and forms of command and control.

In the military, the activities that leaders do are consolidated under the term *command and control* (often referred to as C2). *Command* refers to the

provision of leadership direction of armed forces' behaviors; *control* refers to the provision of focus to those behaviors. The various advanced technological and/or organizational means to assist military leaders perform command and control are referred to as *command and control systems*. For example, the leader in charge of an army battalion is called, as one expects, a commander; the battalion staff, serving the commander, manage and provide the command and control systems necessary to make the battalion work. The commander directs the battalion's work through *orders* that capture what the commander wants done, when, where, and how. The staff publish the orders, see that they are implemented (executed), and assess how well the battalion has performed. Together, a commander and a staff of a military organization can be understood to provide *organizational command and control*. Military organizations such as battalions can be combined to form larger formations. In armies, combined battalions become brigades or regiments, combined brigades and regiments become divisions, combined divisions become corps, and combined corps become armies. In navies, squadrons merge into task groups, which merge into task forces, which in turn merge into fleets. For air forces, the relevant organizational building blocks typically are squadrons, groups, wings, and air forces. All the levels of military organizations, regardless of specific military service, are referred to in a general nomenclature called *units*. Each level of command and control has its own commander and staff, as well as armed forces members who do the work in the units.

In most nation-states, the military is the largest public organization; command and control thus becomes not only a necessary function but a vital one for the future well-being of the nation and the military organization. Major command and control tasks are design, plan, direct, manipulate, communicate, coordinate, learn and adapt, monitor, and evaluate. There are many ways a military organization can execute these tasks. They can be accomplished in *centralized* or *decentralized* fashion. Centralized command and control means all flows of information within the organization go through the highest level commander and staff; decentralized command and control enables lower level units to manage their own flows of information and perform their tasks in their own way as long as the higher level orders are accomplished. There is a range of

possible centralization-decentralization command and control options. Historically, the Prussians/Germans have opted for a decentralized command and control approach; the Soviets/Russians chose a highly centralized approach. Americans, British, and French armed forces' command and control traditionally have fallen somewhere in the middle of these two extremes. To have effective centralized command and control, military organizations must have highly reliable and capable communications systems that carry the flows of information, typically orders and related documents, to all units. To have effective decentralized command and control, military organizations must have highly trained commanders and staffs at all levels, and the overall commander must have a clearly stated and understood direction and focus.

Command and control tasks also can be accomplished through a *hierarchal* or *flat chain of command*. A chain of command is said to exist if there is an authority to publish orders from the highest level of the military command and control organizational leadership to the lowest level of organizational leadership. If orders must travel through many levels of command and control to reach the lowest level, the chain of command is strongly hierarchal; if there are few levels, the chain of command is strongly flat. Military organizations choose hierarchal chains of command when the focus of military actions is most important; in this case, all units are subject to strict control parameters from the topmost leadership. Conversely, military units choose flat chains of command when the direction of military actions is most important; that is, the units need to accomplish the directions quickly.

The method of command and control, whether using a centralization/decentralization or hierarchal/flat chain-of-command approach, depends on the cultural predispositions of the particular military organization and the situation in which the military organization must work. For example, in the American military, the navy has a cultural tradition of flat chains of command coupled with relatively decentralized command and control. The U.S. Air Force also has a cultural tradition of flat chains of command but uses highly centralized command and control. Both the navy and the air force have had to adjust these approaches to meet the requirements of the situation. In Operation Iraqi Freedom, the navy had to adapt to a more hierarchal chain of

command called for by the joint (all the services) and combined (international) nature of the operation. In the early months of Operation Enduring Freedom, the air force had to decentralize its air operations more than it was accustomed to in order to meet the needs of fast-changing situations on the ground in Afghanistan.

In short, there are no “best” or “optimal” methods of command and control. There are only successful and unsuccessful examples.

History

Small armed forces conducted the very oldest of humankind's wars. In these cases, such as tribal war, command most likely was direct and centralized; there was only one warrior leader, and that warrior likely executed all tasks attendant to the function. As armed forces grew in size and diversification, indirect methods of execution developed: Subordinate commanders and liaisons appear in early historical texts from Greece and China that mention the coordination of subordinate commanders to achieve operational goals and objectives. These were the first command and control systems, and mostly they were organizational solutions. For example, Herodotus writes of the role of Themistocles in coordinating land and naval defenses with leaders of the Greek city-states against the Persian threat (also mentioned by Herodotus as an extremely large force with subcommanders answering to the great Persian king Xerxes).

As armed forces grew in size and their areas of operation expanded, direction and focus became more difficult to conduct and coordinate by leaders. To help them command and control their units, leaders increasingly turned to technology to facilitate the flow of information among their units. Signal communications of many types appeared: signal fires and flares (fire arrows), flags, and musical sounds (e.g., bugles and trumpets) appear in all early military histories. Napoleon even used mirrors placed on hilltops to relay coded messages to his marshals during his many campaigns. These technological command and control systems seemed to effectively support the command and control function as long as the speeds at which armed forces moved remained relatively constant, that is, at the speed of a horse and a man.

As the Industrial Revolution progressed in the 19th century, technologies developed that quickened

the pace and increased the lethality of military operations and campaigns far beyond that of horses and men. These advances included railroads, telegraphs, rapid-fire and long-range artillery, repeating rifles, telephones, and finally machine guns. Command and control methods and command and control systems initially could not keep pace with the technological advance. The ancient command and control approach of a centralized chieftain, assisted by a group of subordinate chieftains, doing most of the command and control tasks had only modestly changed when World War I happened. Suddenly, amid the carnage of a high-intensity modern battlefield, commanders lost their ability to command and to control, as well as their ability to communicate with their subordinate units in a timely manner. For example, during the Battle of the Somme in 1916, frontline British infantry units routinely could not tell their artillery support to shift targets because communications were disrupted by German artillery cutting telephone and telegraph lines; flags couldn't be seen through the smoke of the battlefield; human messengers were too slow and too vulnerable to the German artillery. Even homing pigeons became lost in the din and smoke of battle. The result was a slaughter of British forces on scales that beggar the imagination: 25,000 killed on the first day and 250,000 killed over the course of the battle. British high-level commanders did not visit the frontlines for weeks, under the flawed assumption that information flows were working (their staffs continued to publish orders that were received by dead subordinates and dead units).

Only after almost 4 years of incredible bloodshed in World War I did a truly significant and revolutionary change in command and control happen. In the desperate situation facing them in the last year of the war, the Germans found a command and control method—more accurately a rediscovery of an approach from the early-19th-century Prussian army—that almost gave them the decision they sought. The alternative, often referred to as *Auftragstaktik* or mission-based tactics, decentralized both command and control to the lowest level tactical units. This straightforward principle called for the overall commander to provide an idea or command intent for an operation—this was the “what” of the operation; subordinate commanders filled in the blanks to achieve the “how” of the operation. Low-level commanders developed their own specific

command and control tasks and executed them on the spot, without waiting for orders from higher headquarters. The resulting military actions sped up, with forces practicing this system quickly adapting to the rigors of the battlefield and attacking gaps in the enemy forces, like water pouring into crevasses in rocks. The enemy forces were paralyzed by the speed and demoralized by the attacks from all directions, not just the front. During Operation Michael in the spring of 1918, German forces achieved the operational breakthrough of Allied lines that they had tried so long to gain; however, they lacked the reserves and the necessary clear direction from their highest commander (Lundendorff) to complete the breakout of their forces into the Allied rear that would have proved decisive. British forces in the late summer of 1918, adopting the same German command and control method for their own forces, repaid the favor and with adequate reserves were about to break out into the German rear when the November 1918 Armistice halted all activity along the Western Front and elsewhere.

Curiously, during World War II, only the Germans practiced *auftragstaktik* command and control methods. All other military forces, with the exception of all the naval forces practicing essentially decentralized command and control, used the older, centralized command planning and mission control with decentralized execution. Analysis of the continuation of older, slower practices of command and control indicates that technological advances between the two wars perversely reinforced the use and utility of the older system. Reliable and portable radio communications, especially multichannel radio communications, was the major command and control technological innovation. Radio communications no longer limited overall command oversight of operations to relatively short distances of signals and wire communications. From far away, overall commanders now could reach down to the lowest echelons of maneuver to control their own operations. Subordinate commanders, particularly in the Allied forces, became tools for overall command to manipulate based on the information provided by radios. In truth it may be said that the Allied forces succeeded in winning World War II depending far more on ponderous mass than on speed.

With the advent of the information age in the 1950s, and the extremely powerful technologies that have developed within the age, the tendency of

overall command to insist on detailed control of low-echelon units has expanded to include all dimensions of the battlespace (land, aerospace, maritime, and virtual). Global access to information all the time has accelerated this tendency. Even though there has developed a strong advocacy of mission command methods throughout most developed nations' military, military thinkers and writers now observe that militaries exhibit a "zero-defects" mentality that aims more toward information media damage control than toward effectiveness in the demanding operating environments of the 21st century. In effect, command and control technology trumped command and control organization and process in terms of budgets and leadership attention.

Recent Developments in Command and Control

A common way to discuss modern command and control is to address the topic in terms of method or process, organization, and technology. The latest developments in the command and control method originate from the U.S. Command and Control Research Program. This ongoing research entity has sponsored much research on all facets of command and control, but its most interesting contribution is the Command and Control Approach Space, a three-dimensional matrix that describes the complete range of possible command and control methods within one visual conception. Three general variables make up this approach: (1) the pattern of interaction among the relevant subunits, or entities, of the organization, including the headquarters; (2) the distribution of information among these subunits; and (3) the allocation of who gets to decide among those subunits. The most recent version is shown in Figure 1.

According to Command and Control Research Program researchers, command and control methods in the lower left and back area, described as Conflicted Command and Control, have the least ability to adapt to rapid changes in situations. This was the case of the British command and control at the battle of the Somme (and subsequent battles until 1918) mentioned earlier. Those command and control methods in the upper right and front, Edge Command and Control, have the most agility; this is the region that describes high-performing organizations. For example, General Heinz Guderian's

Figure 1 Command and Control Research Program
Command and Control Approach Space

(German) combined arms assault on the French lines at Sedan in May 1940 exemplifies Edge Command and Control organizational behavior. In that instance, German units acted so quickly with such focus on their objectives, shifting their movements as local situations required, that the French forces simply became unable to effectively respond and collapsed into a hasty and prolonged retreat. The German units did not require a constant flow of information, orders, from their headquarters; they knew what their leader (Guderian) wanted, and they were provided the authority to do whatever was needed to accomplish their mission.

With respect to modern command and control technologies, two developments stand out with particular distinction: satellite communications and computers. Satellites remove the tyranny of terrain from affecting the communications necessary for effective command and control. They provide a wide range of information, from orders to real-time visuals of relevant battlefields to navigation aids. Satellites have become indispensable to military commanders, and their potential is limited only by the human imagination and the bandwidth available to communicate. It can be argued that *all* satellites,

being communication devices, are command and control systems; their variety constitutes an alphabet soup of names that is beyond the purpose of the present entry. One historical example of the application of satellite technologies suffices to illustrate the power of satellite command and control technology. Operation Desert Storm, in early 1991, provided the operational debut of the Joint Surveillance Target Attack Radar System. Using satellite sensors' information downloaded to an aerial platform, a modified Boeing 707, Joint Surveillance Target Attack Radar System was able to track more than 2,000 distinct potential targets simultaneously and instantly forward that information to military command and control centers for action. This integration of technology into organizational procedures gave the U.S.-led coalition an unprecedented situational awareness of the Kuwaiti and Iraqi battlefield, which significantly contributed to the decisive defeat of Saddam Hussein's Iraqi forces. However, as vital as satellites are to command and control, they are and will be only as effective as the second major development in command and control technology, the computer.

In the short span of time from the 1960s to the 1990s, computers migrated from a few very large, cumbersome and slow machines located in centralized areas not conducive to fluid battlefield situations to many small, agile, and fast machines located everywhere and with everyone (think of cell phones as a form of computer). Computers provide the information power that makes modern command and control able to work in near real time over great distances. The difference that computers have wrought on command and control is breathtaking.

For example, in 1944, General Dwight Eisenhower struggled to command and control his multi-million-soldier army in France from his headquarters in England with a handful of radio and telephonic channels that required legions of communications specialists for support, and even then he maintained a time-lapsed and incomplete idea of what both his own forces and the enemy forces were doing at any given time. Contrast Eisenhower's experience with General Tommy Franks in 2003 during Operation Iraqi Freedom. Franks, located at Central Command in Florida, was able to exert command and control over his forces almost 10,000 miles away, using near-real-time audio and visual information that monitored both what his and the enemy forces were

doing at any given time. The difference between the command and control capabilities of these two leaders was the availability of cheap, omnipresent, and highly capable computers at all command and control levels of the latter operation.

The future of command and control technologies centers on the further developments of the computer. Since those developments are driven by Moore's law, a predictive rule that shows that computing power increases at a geometric rate, it is safe to state that the role of computers in command and control approaches will accelerate. Consider this one case: Military research facilities are experimenting with implanting microprocessing chips (tiny computers) into individual soldiers. These chips can record movements both in audio and in visual modes, receive orders, and retain vital records in case the soldier recipients become casualties.

The third and final aspect of command and control developments concerns the organizational structures that enable leaders to practice command and control. Curiously, these structures have changed the least, despite the process and technology changes that have previously been described. Referring to the comparison of Eisenhower's and Franks's experiences described above, Eisenhower would find the command and control organization of Franks's Central Command very familiar to him. The staff structures and hierarchical nature of the headquarters have remained relatively constant since their emergence from the ashes of World War I. Nonetheless, there are subtle changes that only very recently (post-2005) are starting to organizationally affect the way command and control is practiced. These changes are captured by the phrase "ad hoc-ism," or by the acronym B2C2WG (boards, bureaus, cells, centers, working groups). In the face of the organizational stovepipes that traditional staff structures impose on command and control activities (traditional staffs are Personnel, Intelligence, Operations, Logistics, Plans, and Communications), and to take advantage of the speed and power of combined satellite and computer-generated information, leaders and their staff have invented on-the-fly temporary collaborative groups to quicken the pace of command and control and to make it more effective in the direction and focus of operations. One can observe the expansion of this concept in command and control organizational doctrine. Typically, such doctrine is

expressed in organization charts (often referred to as "wiring diagrams"). Increasingly, traditional staff structures are being supplanted by "task forces," such as the Joint Special Operations Task Force, the Joint Civil Military Operations Task Force, the Joint Psychological Operations Task Force, and the Joint Interagency Action Coordinating Group. These entities break down the stovepipes of traditional staff organizations and enable leaders and staff to practice "Edge C2"-like command and control methods.

Concluding Observations

Researchers of military operations consistently note that success on the battlefield primarily is due to the confluence of excellent individual and unit training, advanced technology integrated with trained forces, and effective leadership, all wrapped up with robust information sharing (shared awareness and shared understanding). The command and control function now can take advantage of unprecedented information and communications technology enabling clear definition of operating environments; distinction of relevant combatants and noncombatants; integration and concentration of precisely guided and applied force, energy, and mass; coverage of literally global spaces and times; and communication of all the preceding information to all relevant stakeholders in military operations. Most recently, these enabling capabilities now have become accessible not only to leaders but to individuals under their command.

Command and control technologies allow even miniscule forces in remote places to access the information networks of the entire globe. As an illustration of this phenomenon, consider how al Qaeda's leaders, burrowed in caves somewhere in the northeast Hindu Kush, can regularly send messages to their followers on the Internet.

The critical problem for present and future overall command is highlighted by the use of the terms *efficient* and *manage*. Warren Bennis, an acclaimed student of leadership, has explained the conundrum: To manage is to do things right (efficiency), and to lead is to do the right things (effectiveness). Putting this in the context of the military, the late Colonel D. Michael Malone, an architect of the U.S. Army's organizational and leadership transformation in the wake of the Vietnam War, has

written that no one ever managed soldiers across a battlefield; they had to lead them. At the heart of the current evolution of the command function is the human, not the machine. The key indicator for the success or failure of the command function and related tasks is trust—shared among the participants in military operations. Where the trust is high and symmetric (from leader to follower and the reverse, and across all relevant unit levels), the command function likely will lead to successful military operations. Where such trust is found wanting, the command function likely will fail in effectiveness.

The command and control function has dramatically changed over the ages, particularly recently with respect to technology. Yet this function remains human at its core. There one finds that the evolution has been more psychological and sociological than technological. Commanders must be competent in both to best apply the function to operations.

COMMAND AND GENERAL STAFF COLLEGE

The Command and General Staff College (CGSC) is a graduate school that functions as part of the Leader Development and Education organization at the U.S. Army Combined Arms Center in Fort Leavenworth, Kansas. The CGSC was founded in 1881 as the School of Application for Infantry and Cavalry and is composed of four individual schools that provide professional education for military officers, including some from foreign allied nations. The four schools that constitute the CGSC are the Command and General Staff School (CGSS), the School of Advanced Military Studies (SAMS), the School for Command Preparation (SCP), and the School for Advanced Leadership and Tactics (SALT). As of 2012, the commandant of the CGSC is Lieutenant General David G. Perkins. The CGSC's mission is to "[educate and develop] leaders for full spectrum joint, interagency and multinational operations; [act] as lead agent for the Army's leader development program; and [advance] the art and science of the profession of arms in support of Army operational requirements."

History

Although it was founded in 1881, the major development of CGSC took place during the interwar years and World War II. Many of the Leavenworth faculties were instrumental in the intellectual development of army leadership from 1919 to 1940 and in the creation of the 1940 *Staff Officers' Field Manual*. After World War I, downsizing of the army left the institution in poor shape, and debate raged over the kind of officer education the U.S. Army should embrace.

The army's emphasis on continuing education after World War I would eventually prove vital to Allied victory in the Second World War. After the hard-learned lessons of World War I trench warfare, the officer corps was trained in preparation for a large-scale conventional war based on modern tactics and supported by a fully mobilized nation. Despite additions to doctrine regarding airborne troops and armored divisions, the army's doctrine on artillery teamwork, combined arms, and the necessity of offensives remained the primary focus of officer education leading into World War II.

In the interwar years, students at Leavenworth were taught a curriculum focused on problem solving and "learning how to learn" according to George C. Marshall's principles. Future officers and commanders were taught to adjust quickly to new situations and to strategies for employing their men in a variety of tactical scenarios. Instrumental to the mission of CGSC at the time was the concept that command and staff training worked together as complementary skills rather than opposing approaches, though leadership and mobilization received less focus in the classroom. Course duration often varied from 2 years to 1 year and back again throughout the 1930s, and student input was widely sought by faculty members, though students rarely made recommendations for change.

Marshall objected, however, to what he saw as CGSC's neglect of command officer preparation in favor of staff training instead. He hoped to bring new ideas and leadership to Leavenworth and wanted more attention to be paid to large-scale maneuvers. In 1939, students responding to a survey described a lack of focus on divisions, corps, and tactical principles in their education. Despite changes in Leavenworth's curriculum, there was a notable lack of training for the Army Air Forces and Supply Operations. The experiences of the early years of World War II indicated that prewar preparations had significantly underestimated how high the demand for well-trained officers would be, as well as how great the necessity for large command structures would become in the post-1941 war.

The Command and General Staff courses eventually produced the officer corps that won World War II and influenced army command structure through the Cold War years. Several major tactical realizations were key to these officers' success. First, that the German Blitzkrieg was not a novel or even consistently effective tactic, and resembled the Allied breakthrough tactics from World War I. American officers realized this and harnessed enormous, mobilized resources to pursue this strategy, securing a major component of Allied victory in World War II.

Further lessons from World War I's stable front were utilized at Normandy and in the subsequent breakout. Mobile front tactics, particularly in artillery, as well as the combined arms strategy emphasized at Leavenworth, were all key to American victory. The lessons of World War I colored the

education of the officer corps in the interwar years, despite significant failings in mobilization, air power training, and large-unit readiness (particularly in the Western Pacific). After the 30-fold increase in army officers during World War II, the United States rose to the challenge of educating its leadership for command, staff, and combat duties. Thanks to officer education at Leavenworth, the United States emerged as a superpower from World War II, with a modern, intellectually prepared force to secure Allied victory on a global scale.

CGSC Today

Of the four schools in the CGSC at Leavenworth, the CGSS is the largest and the most well known. As a graduate school, the CGSS provides both Intermediate Level Education to officers as well as the opportunity to earn a Master's of Military Arts and Sciences. There are six departments within the CGSS: the Department of Army Tactics; the Department of Command and Leadership; the Department of Distance Education; the Department of Joint, Interagency, and Multinational Operations; the Department of Logistics and Resource Operations; and the Department of Military History.

The SAMS provides graduate-level training to officers at the strategic and operational levels to develop leadership ability. SAMS graduated its first class in 1984, and its leadership training provided General Norman Schwarzkopf's "Jedi Knights" during the Persian Gulf War. Like the CGSS, SAMS offers two programs: Advanced Military Studies, in the second year of Intermediate Level Education, and the Senior Service College Fellowship.

The SCP not only serves as an educational program for Army Command Teams but provides support for the spouses and families of officers as well. The focus of courses at the SCP is command tactics and the preparation of joint-enabled command teams across a range of military operations.

Finally, the SALT provides branch-specific continuing officer education to obtain mastery of technical and tactical skills. The goal of SALT is to develop the Leavenworth Scholar-Warrior-Leader from First Lieutenant to Major, and SALT's focus also includes direct-command competencies, staff process in battalions and brigades, and other broadening opportunities.

Conclusion

The CGSC's ability to meet the challenges of modern warfare owes heavily to the development of doctrine and tactics during the interwar years and to the hard-learned lessons of World War I. Thanks to the expansion of officer education, the U.S. Army was able to emerge post-1945 as an intellectually driven, well-educated, and well-trained force. Through the Cold War years and into the modern requirements of officer training today, Leavenworth has functioned as the center for world-class strategic, operational, and command and staff preparation for the army's leadership.

COMMISSIONED OFFICERS

Commissioned officers make up the top of the U.S. military hierarchy within each branch of the service. Among commissioned officers are various ranks that further separate them by level of authority. Serving beneath commissioned officers are enlisted personnel. The enlisted ranks have a system of leaders within them called noncommissioned officers (NCOs). The NCO ranks lead personnel on the smallest levels of organization, as well as at the highest levels alongside commissioned officers. Outside the officer and enlisted ranks are warrant officers. Typically trained in a focused specialty or trade, warrant officers often act as the commanding officer of a military unit or fall directly under a commissioned officer. Commissioned officers lead military

units and serve in support roles essential to maintaining the combat effectiveness of the force. This entry describes how to earn a commission, the benefits available to an officer, and the responsibilities of an officer.

Earning a commission as an officer in the U.S. military can be done in a number of ways. U.S. service academies are universities that grant degrees to their students while simultaneously training them to become commissioned officers on graduation. When students' commissions are received, they earn the rank of second lieutenant in the army, air force, and Marine Corps, or ensign in the navy. Nonmilitary colleges and universities also offer an equivalent to the service academy path to commissioning. The Reserve Officers' Training Corps allows traditional college students to earn a commission as an officer on graduation as well. A third option is Officer Candidate School. In these accelerated schools, candidates train full time to earn their commissions in only a few months. These options are all open to both prior service enlisted personnel and civilians. Noncommissioned officers found to have extensive experience and superior leadership abilities occasionally receive commissions directly into the officer ranks after evaluation and without additional training. Enlisted soldiers (mainly NCOs) during past wars have been granted a small number of "battlefield" commissions based entirely on their demonstrated leadership in combat. While direct commissions do occur, they are the rarest of the commissioning paths. It is important to note that these commissioning programs are open to all Americans who meet the physical and academic standards for enrollment. Throughout American history, officers have largely received their commissions and appointments to service academies through social or political status as opposed to their credentials. This changed significantly over the course of the 20th century. Candidates desiring to become officers in today's military are selected without regard for race, ethnicity, or financial background.

On receiving a commission, officers are afforded a number of courtesies by the enlisted ranks. The hand salute is rendered outdoors by enlisted ranks when the officer passes as well as when reporting to a commissioned officer. A room containing enlisted soldiers is called to attention when an officer enters, and again each time a higher ranking officer enters. An officer is addressed by rank or as "Sir"

or "Ma'am" by his or her subordinates. Officers receive higher pay and are billeted in quarters separate from the enlisted ranks as well.

The benefits afforded to officers have always been a source of contempt from the enlisted ranks. The military's firm bar on fraternization between enlisted and officer ranks, combined with the material perks of holding a commission, have created a barrier that often causes friction between the two sides. The historian Gerald F. Linderman and literary scholar Paul Fussell have both written at length about discontent arising from the exclusivity of officers' clubs and officers' alleged willingness to exert their authority on enlisted personnel through punishments, often for no more than sadistic, personal satisfaction. Enlisted personnel have frequently expressed these feelings, often justifiably so, but the segregated atmosphere also promotes effectiveness within the ranks. Officers must carry out orders and make decisions that are not always favorable to their subordinates, making the need for separation essential. The courtesies and benefits that accompany being an officer, however plentiful from the enlisted perspective, come with a variety of additional responsibilities that offset their appeal.

A commissioned officer is most often placed in a role where he or she is in direct command of other service members. The leadership of commissioned officers is essential to the successful completion of their units' missions. A 1942 manual for officers attributes the entirety of an officer's success to his physical strength, mental fortitude, moral character, and technical proficiency. Those qualities would, in turn, inspire subordinates and lead to victory.

An officer is expected to be a leader in all forms. Effective commanding of a unit during combat operations and training exercises, while perhaps the most practical trait of a good officer, is only a fragment of what is expected of officers. The officer should lead by example with regard to personal grooming, uniform wear, physical fitness, values, and professional development—all sharing a part of the makeup of effective and influential officers.

In today's military, officers also act as a source for guidance and support for their personnel. During combat operations, officers are responsible for the mental and physical well-being of all personnel under their command. The spectrum of support ranges from combat stress to family affairs at home. When stateside, an officer intervenes with his or her

personnel with regard to domestic issues, substance abuse, and legal affairs, or any issues affecting physical or mental well-being.

Earning a commission as an officer in the U.S. military is a challenging and often lengthy process, but it is only the first, and ultimately the simplest, of the tasks that officers encounter. When the nation is at war, service members are deployed continuously in support of combat operations overseas and therefore carry a great deal of responsibility with regard to both their military and their personal lives. Commissioned officers share those responsibilities with their subordinates, taking responsibility for the well-being of those they lead as well as themselves. In combat, their guidance and leadership are the ultimate factors that determine the success of the mission and the security of those involved in the execution of the mission. Outside of combat operations, the lives and stresses of every soldier under an officer's command become the lives and stresses of that officer. As the ultimate authority in the U.S. military, the responsibilities accompanying commissioned officers are ever present and multifaceted.

mere part of the background. The capacity to collect and transmit messages has, however, been a key part of military decision making and has often proved decisive in winning wars. Access to better real-time communication technologies (e.g., telegraph, telephone, radio, computer, satellite, network, etc.) has been improving and transforming command and control (C2). Today, communication is a bedrock of the Western, and in particular the U.S., conduct of military operations. Networked and digitalized armed forces and their high-tech precision weapons are greatly dependent on the uninterrupted, real-time and constant flow of huge volumes of data. This has been, however, a relatively new development. This entry discusses the history and technology of communications within the military, focusing on the U.S. armed forces.

Military Communications Before the 1850s

Communication technology did not significantly improve until about 1850. From ancient times, signaling modes included the following: (a) human signaling (the use of hands and devices such as hats and handkerchiefs); (b) music (trumpets, horns, and drums announced orders to attack or retreat); (c) fire, flame, and smoke (for ages, fire was the only technique for sending messages at night, while in the daytime covering flames with a blanket produced puffs of smoke—a simple means of visual communication); (d) flags (patterned or colored pieces of cloth allowed for the sending of messages at sea and on land); (e) couriers (men—on foot and horseback—and animals—pigeons and dogs—carried messages over great distances; pigeons were used, e.g., by Genghis Khan, who set up one of the first networks of strategic communication—a system of pigeon messenger posts); and (f) elements of architecture (signal towers were key parts of some grand constructions, e.g., the Great Wall of China, Hadrian's Wall).

Medieval, Renaissance, and early-modern signaling remained similar to the modes of ancient times. Only in the 18th century did a significant innovation in sending messages arrive, breaking for the first time the physical bond between message and the messenger. During the Napoleonic Wars, Paris was already linked to the major French, and some European, cities through a network of mechanical semaphore (optical telegraph) stations built in 1794.

COMMUNICATION

Throughout history, communication has been central to the conduct of military campaigns. Nevertheless, until recently it has not been a significant theme in the discourse on war; rather, it has been seen as a

The system, which allowed for the relatively quick transmission of military messages, heralded future technological developments.

From Telegraph and Telephone to Radio: The Two Communication Revolutions

The first technological breakthrough came with the invention of the electric telegraph in the 1830s and the Morse system of coding, which simplified and sped up the transmission of messages. The military quickly recognized the potential of telegraphy. The first conflict in which the new technology was extensively used was the Crimean War (1853–1856), during which a network of telegraphic lines enabled the governments in London, Paris, and St. Petersburg to send memos and orders to their field commanders. The telegraph reports from the front line could also quickly affect public opinion, and the first war correspondents appeared. During the wars between France and Austria (1859), Prussia and Austria (1866), and France and Prussia (1870–1871) and in the American Civil War (1861–1865), telegraphy proved to be the crucial military technology. Apart from the railroads, the machine gun, and the bureaucratic organization it had become one of the emblematic features of modern warfare and remained, until World War II, the most common means of military communication.

The telephone, invented in the late 1870s, was initially more slowly adopted by the military than its wired predecessor. The U.S. Army Signal Corps set up an experimental telephone line in 1878, and the first military telephone switchboard in Britain was installed in 1896. At first, the telephone became popular at headquarters, while its strategic and tactical use was made possible only by the advancements that allowed for the production of smaller and lighter devices. The British during the Boer War (1899–1902) and the Americans during the Spanish-American War (1898) made considerable use of telephones. During World War I, the telephone was already in widespread use, and in World War II, it carried a significant volume of communications.

Nevertheless, both the telegraph and the telephone were still of limited use for faster moving divisions and units. The groundbreaking invention came with the radio (wireless telegraphy), developed at the end of the 19th century, which demonstrated its military benefits with the Japanese victory over

the Russian fleet at Tsushima in 1905. Radio made possible the “remote” C2 of naval and land forces. In World War I, radio was still crude, breakable, and bulky, and it proved much more effective at sea than on land. It was during World War II that smaller and more efficient equipment came fully into use. Portable devices, such as tactical two-way radios (walkie-talkie and handie-talkie), made radio highly valuable on the front line: It could keep the infantry in constant contact with its field headquarters. Radio facilitated the growth of genuinely mobile military communications—forces could move but still be able to communicate without being bound by wires. First the telegraph, then the radio took military communication a giant step forward; the next watershed would arrive with the digital era.

The Third Revolution: Computers, Satellites, and Networks

During World War II, code breaking of enemy radio transmissions was of strategic importance for the Allied war effort, and it was for this task that the first calculating machines (analog computers) were developed by Alan Turing and others. Computers were introduced to the military to deal with the huge volume of information needed for the management of modern warfare. Paradoxically, however, their existence and improvements have resulted in the further growth in the amount of data to be processed. The miniaturization of electronics, which began in 1947 with the development of the transistor, has been a key trend in transforming communications. Electronic Numerical Integrator and Computer, one of the first computing machines, constructed in 1946, was not only about 17,000 times heavier and a billion times less powerful than our contemporary laptops, it was also extremely power consuming. The solid-state electronics revolution in communications was taken further in 1958–1959 with the invention of the integrated circuit and the packing of transistors, connections, and other electronic devices onto one silicon chip. The next major step was the 1971 Intel 4004 chip microprocessor, which squeezed all of the computer’s working parts onto a single chip. An additional improvement was made with the introduction of fiber optics, which considerably enhanced communication systems. With the arrival of the first military communication satellites in 1958–1959, instant and real-time communication

between central and theater military commands and units in remote parts of the globe became possible. The true birth of military satellite communication (SATCOM) began in the mid-1960s, and the successive generations of satellites have been regularly increasing the capacity and speed of the information flow. Miniaturization allowed for more portability and mobility—the two features crucial for the progress in military communications. Electronics has been developing according to “Moore’s law”: The capability of a microchip processor doubles every 12–18 months without an increase in cost. Thus, every year computers can make more calculations, and greater amounts of information can be processed. The power of computers has been growing, resulting not only from the advancements in microelectronics but also due to their integration into networks. The coming of the Internet (which originated in the military Advanced Research Projects Agency Network, developed in 1967 as part of the search for a hardened C2 communication architecture that would survive a Soviet nuclear strike) and Wi-Fi routers has greatly multiplied the amount and speed of data flow. According to “Gilder’s law,” the speed of transmission, that is, the capacity of data links, doubles every 12 months. Therefore, the tempo of military communication constantly increases, which subsequently allows for the speeding up of the conduct of military operations.

The contemporary networked systems of military communication allow for the rapid transmission of an enormous amount of data, text messages, pictures, videos, and voice messages. The information revolution brought about the new American information war capabilities, which were collectively put to the battlefield test in 1991.

The Persian Gulf War: The Harbinger of Things to Come

The Persian Gulf War (1990–1991) was not only the first information-age conflict but also the first war of the space age. Information and space communications played a central role in its conduct, especially in the successful use of high-tech weapons, for example, precision-guided munitions (PGMs), unmanned aerial vehicles, and stealth fighters. The effectiveness of strikes with PGMs against Iraqi targets depended on the accuracy of information and the speed of its transmission. Thus, SATCOM became vital for the

whole campaign against Iraq. The coalition used as many as 60 satellites, utilizing the two basic systems: Defense Satellite Communication System, which provided telephone and telegraphic communication, and Air Force Satellite Communications System, which secured communication of command over strategic forces. Defense Support Program early-warning satellites, in service since 1970, were used for tracking Iraqi launches of Scud missiles. A Global Positioning System (GPS), developed since the 1970s and based on the NAVSTAR (Navigation Satellite Timing and Ranging) collection of satellites, enabled, for the first time in war, U.S. Army units to determine their position in the Iraqi desert.

The air space over the Persian Gulf was monitored by Airborne Warning and Control System aircraft, which gave early warning of Iraqi air force movements, thereby supporting the coalition strikes. By sending data to ground communication centers, which in turn linked the information to air force planes, the Airborne Warning and Control System greatly supported the C2 of the air battle. The navy relied on E-2C Hawkeye radar surveillance aircraft. A secure communication channel between the air force’s Airborne Warning and Control System and the navy’s E-2C was provided by Link-11 (a high-speed, radio data link communication system).

U.S. Central Command established the largest theater communication system in military history. The extent of the information flow made frequency management a vital task. Operation Desert Storm Network, the management center for which was located at Fort Huachuca (Arizona), was the “megsystem” created especially for the campaign. It linked thousands of computers through satellites and lines. The war marked the evolution of the role of mobile communication (a phenomenon dating back to the first mobile telegraph units) from merely supporting military operations to being an integral element of the military force, able to keep pace with the instantaneously changing combat environment. At the end of the war, the coalition communication architecture was imposing: 2,300 personnel, 7,000 radio frequencies, and 59 communication centers. During the war, the coalition forces made 29 million phone calls. Command was profoundly dependent on civilian SATCOM, and much data traveled over landlines to a commercial satellite terminal in Kuwait City, from which it was sent to the continental United States for analysis and, after

processing, was transmitted back to the command posts in the area of operations. While in the Gulf War 80% of SATCOM was provided by military satellites and 20% by commercial, during Operation Iraqi Freedom (OIF, 2003) this ratio was reversed. Thus, the extensive use of civilian satellite infrastructure by the Department of Defense has become a permanent feature of U.S. military operations.

Wars in Afghanistan and Iraq: Welcome to the Digitalized Battlefield

After the Persian Gulf War, the new high-tech weapon and communication systems were significantly improved and were applied en masse during Operation Enduring Freedom (OEF, 2001) and OIF. The American way of war has become fully digitalized, dependent on information and its means of transmission.

OEF was challenging in terms of providing military communications—for a number of reasons. First, the terrain was rugged and mountainous. Second, it was probably the most heavily mined area in the world, with approximately 10 million hidden land mines, according to the United Nations. Third, setting up three command headquarters vastly increased the communication requirements (the U.S. Central Command headquarters and planning staff in Florida; General Tommy Franks, his staff, and the Army Central Command in Kuwait; and the Combined Forces Land Component Commander Forward in Uzbekistan). It is no wonder that the SATCOM bandwidth exceeded that used in the Gulf War by a factor of 7.

At the height of the OIF, 60% of all communications went through almost 100 satellites of various types; 15 times more satellite bandwidth was available than during the Persian Gulf War. While in 1991, the U.S. forces numbered 542,000 and the military had at its disposal a bandwidth of 99 megabits per second, in 2003, the forces were downgraded to 350,000 but the bandwidth grew to 783 megabits per second. When analyzed “per 5,000 military members,” the bandwidth increase was 50-fold.

Joint command at the U.S. Central Command level was conducted via the Global Command and Control System, which provided a God’s-eye view of the battlefield as never before. Gradually developed since its introduction in 1996, the Global Command

and Control System is an automated network system of global reach providing information for strategic C2. It is a single, predominant metasystem allowing for great service interoperability. In OIF, 80 aircraft carried out intelligence, surveillance, and reconnaissance missions, flying 1,000 sorties and collecting 42,000 battlefield images, 3,200 hours of streaming video, and 2,400 hours of signals intelligence coverage. A great portion of this tremendous amount of raw data was passed on to the continental United States through satellite communication networks, processed and analyzed, and then disseminated back as processed information across command posts and fighting units.

The intelligence, surveillance, and reconnaissance missions of the Predator and Global Hawk unmanned aerial vehicles provided real-time intelligence on remote targets waiting to be eliminated by PGMs. The data collected by the unmanned aerial vehicles were processed by intelligence analysts working 7,000 miles away at sites in Nevada, California, and Virginia and reported back to OEF’s Army Central Command, to OIF’s Combined Air Operations Center in Saudi Arabia, and to theater commanders in Afghanistan and Iraq. Precise and instantaneous communication over great distances became crucial for the efficiency of smart bombs. The improvement in GPS theater accuracy of more than 20% since the 1990s increased the effectiveness of the thousands of GPS-guided munitions used during OEF and OIF. GPS and its more accurate military version, the Precise Positioning System, played a critical role not only in directing smart weapons to their targets but also in troop orientation in the terrain (during the OIF, the army was supplied with more than 100,000 Precision Lightweight GPS Receivers and the Marine Corps with 5,400).

In Iraq, digital communications and networks gave the United States unprecedented air-land-naval operations coordination and near-perfect battle space awareness. This, in turn, led to an increase in maneuvering speed. During World War I, the fastest telegraph could send 30 words a minute. In the 21st century, using the Military Strategic and Tactical Relay satellites, it takes 0.16 seconds to send updated target data to the in-flight Tomahawk missile and 2.07 minutes to transmit 23 megabytes of image data. During OIF, the United States used the Global Broadcast Service, developed after the Persian Gulf War, which allows for one-way broadcast of data

to many small receivers simultaneously. With the Global Broadcast Service, sending target data takes only 0.01 seconds, while 23 megabytes of image data are transferred in 8.4 seconds. Thus, the capacity of data dissemination is breathtaking. Never before was the time lag between a target's identification and its destruction (the "sensor-to-shooter gap") shorter—sometimes less than 15 minutes.

To enhance the speed and effectiveness of C2 during the OIF, the U.S. Navy used more than 500 chat rooms on the Pentagon's largest C2 data network: Secret Internet Protocol Router Network. A counterpart of the civilian World Wide Web, the Secret Internet Protocol Router Network became the vital communication channel for all services. It provided a medium for sending classified information from the Strategic Tactical Entry Point (which gives forces access to strategic communications architecture worldwide) into the Defense Information Systems Network.

The U.S. Army fighting in the OEF and OIF was an information-age army. The Army Battle Command System, which secured digital C2, enabled commanders to pass on orders, intelligence, logistics information, and other useful data. A new component of the Army Battle Command System was the Blue Force Tracking system for identifying friendly forces. It gave a real-time operational picture of the battlefield. For the OIF's purposes, the technology was installed on more than 1,200 ground and aviation platforms. Blue Force Tracking contributed to the enhancement of integration between the U.S. Army, the U.S. Marine Corps, and British forces and helped reduce incidents of blue-on-blue fire (also called friendly fire).

Both in Afghanistan and in Iraq, the forces commonly used "closed loop" operations, based on a mechanism of feedback between the commander and the units in the field, so the information ran in both directions. The soldiers received C4ISR (command, control, communication, computers, intelligence, surveillance, and reconnaissance) data, which provided them with current-situation awareness, and commanders, after receiving feedback on the results of combat operations, could direct further military actions.

A fairly new pattern of military communication was the TeleEngineering Kit. Units in the field could contact experts at the Vicksburg Center back home to get advice and solutions to complex

technical problems, such as repairs to damaged bridges, by sending information and images. The TeleEngineering Kit used a mobile communication system of a small satellite terminal, a laptop, a camcorder, and a videoconferencing unit. Technical solutions were provided within about 4 hours. TeleEngineering Kit is a good example of sharing information and knowledge during combat and also of the extent to which modern digital technology overcomes distance and geography.

U.S. and coalition forces used the new forms of communication, which in the contemporary civilian world are taken for granted, that is, secure e-mail, chat, satellite phones, video teleconferencing, and digital transmission of text, voice, videos, images, and maps. The Afghan and Iraq wars marked a new phase in the evolution of military communications. They proved the power of information and the novel ways of its transmission both for achieving decisive and rapid dominance and for tactical victory in postmodern warfare.

Conclusion: Challenges and Opportunities

There are, however, some challenges to the high-tech, networked, and digitalized U.S. military communication, infrastructure, and capabilities. First, there are problems with the vulnerability and security of the whole communications architecture. A complex and encompassing system is greatly susceptible to hostile cyber or electromagnetic pulse attack, a mere breakdown, information noise, or overload. Because information has become both the weapon and the target, protection of the communications infrastructure has grown to be more vital than ever before. For example, the Secret Internet Protocol Router Network was the main source of documents allegedly leaked by the U.S. Army soldier Bradley Manning and published online by the website WikiLeaks because too many people had been granted access to the secret levels of information. Second, the greater the communications capabilities, the more data the military transmits and the more capacities it demands to transmit even more data. Information technology development creates an information addiction trap. Third, China—a would-be peer competitor—has been carefully following American developments and investing immensely in the digitalization of its own troops, as well as developing the most up-to-date communication systems, including satellites. It

is preparing for future information warfare. Fourth, civilian technologies associated with globalization have been used by terrorists in planning and carrying out coordinated attacks. Computers, modems, the Internet, satellite and cell phones, handheld radios, and GPS have increased the abilities of many illicit groups to communicate, plan, and coordinate their actions, while sophisticated encryption software keeps their communication highly clandestine. For example, the Lashkar-e-Taiba attackers in Mumbai (2008) were, through cell and satellite phones, in constant contact with their handlers in Pakistan, who watched the live coverage of the rescue combat operation, issued instructions, and provided updated information. Paradoxically, while widely exploiting the products of the globalized world (especially information technologies), postmodern terrorism denounces globalization as such.

Until the mid-19th century, military communication was essentially limited to human-to-human signaling. Based on the experience of the Afghan and Iraq wars, military communications today appear to be more about communication among machines (computers, platforms, weapons, and networks) than among humans. Communication has become real time, automatic, digitalized, networked, multilevel, multiservice, and interoperational. Communication is now important not only for sending orders but also for learning the location of friendly and enemy forces, for coordinating joint (multiservice) operations, for sustaining interoperability, and for the successful use of new high-tech weapons systems (mainly PGMs and unmanned vehicles, including drones). In sum, for the Western world it has become decisive for the very conduct of military operations.

The technological progress after 1945 has spanned numerous vital advancements in military communication: Signal quality has greatly improved, the variety of delivery modes has been boosted, the speed of communication has increased enormously, power consumption and power requirements have declined remarkably, the capacity of digitalized devices and transmission channels has multiplied immensely, and the size of military equipment has been drastically reduced. For example, today's technologies enable near-real-time video from soldiers in fighting positions to be sent to the Pentagon. These dramatic improvements have made possible the achievement of real-time dominant battle space

knowledge and allow for the waging of network-centric warfare.

However, despite the enormous technological advancements in military communications, both the Afghan and the Iraq operations demonstrated that the greatest challenge of information technology is still to supply an army with systems capable of on-the-move communications, backed up with high-bandwidth satellites. The two wars revealed the need for solutions to enhance interservice compatibility (communication integration). The Pentagon has thus intensified the development of a number of systems that together make up the U.S. metasystem of strategic communication. These are, for example, Global Command and Control System, the Global Information Grid (which interconnects communications at strategic, operational, and tactical levels and integrates all defense information systems); the Joint Tactical Distribution System (a secure system linking the army, navy, air force, and Marine Corps); the Joint Tactical Radio System (a software-based gateway for the interoperability of different radio devices); Warfighter Information Network-Tactical (the army's tactical telecommunications system, providing high-speed communications, on-the-move and real-time voice, video, and data, which will be fully fielded probably by 2016); the Weapons Data Link Network (which allows for two-way communication links between air crews, ground personnel, and weapons in-flight); and "C4I for the Warrior" (which aims to merge all major elements of C4ISR in a single grand communications network encompassing all the existing communication systems in the U.S. military).

Current research and development indicate the future trends in military communication technologies: the search for a mind-machine interface that would allow for direct, "power of thought" communication between brain and computer. Experiments (with electrodes and chips implanted into the brain or attached to the head) funded by the Defense Advanced Research Projects Agency have proven the feasibility of this. The idea is to be able to operate weapons and platforms in dangerous battlefield environments merely through brain signals transmitted over huge distances via the Internet. The fourth great communication revolution may well be on the horizon.

the senior enlisted advisor. The exact size and composition of a company varies by the type of organization to which it belongs. For example, a typical light infantry company consists of a headquarters, three maneuver platoons, and a heavy weapons platoon, while a logistics company may consist of up to seven specialty platoons to handle vehicle maintenance, cooking, fuel, and small arms repair. The composition of a company is determined by a table of organization and equipment issued by the Pentagon. This entry describes the organization and employment of the company.

The company has been a unit of organization in the U.S. armed forces structure since its inception in the Revolutionary War. Historically, the company has consisted of approximately 100 soldiers under the command of a captain, subdivided into platoons of about 30 soldiers each under the command of a lieutenant. A company is under the control of a battalion, usually commanded by a lieutenant colonel. The battalion typically consists of between three and five companies. Companies are also called troops or batteries in cavalry and field artillery organizations, respectively. This structure is recognizable in any of the conflicts that the United States has been involved in throughout its history.

Companies are used in a variety of ways across the spectrum of operations. Maneuver companies of infantry, armor, and field artillery are the formations closest to the enemy in conventional warfare. These companies accomplish tactical tasks assigned to them within the battalion scheme of maneuver. A company is typically used in offense or defense, or as a tactical reserve during conventional conflict. Support companies trail behind maneuver units to provide the necessary services that allow maneuver companies to accomplish their tactical missions. These services may include vehicle repair, personnel replacement, supply, and other administrative functions. The organization and utilization of companies in this manner are essentially the same in both the army and the Marine Corps.

Company commanders have had to expand their traditional missions to include stability and civil support operations as a result of their experience in the Iraq and Afghanistan wars. Current army doctrine includes these two broad categories to help prepare companies for the variety of challenges they will face in the current operating environment. Stability operations are intended to favorably influence the

COMPANY

The company is a unit of military organization that consists of between three and five platoons. A captain usually commands a company, with a first sergeant as

political situation within a country, other than the United States, that is in crisis. Typical tasks for companies involved in stability operations include providing security at voting stations or high-level political meetings, maintaining order within a designated area, deterring aggression, or providing humanitarian relief. Company commanders usually employ their platoons separately in this type of non-linear operating environment to accomplish these tasks. Stabilizing an area is a long-term operation that requires the accomplishment of many smaller tasks to win the support of an area's population over time. Platoons are best suited to accomplish these smaller tasks, allowing the company commander to coordinate the larger effort.

Civil support is similar to stability operations, except that civil support missions are conducted inside the United States. Companies are committed to civil support operations in times of crisis, such as Hurricane Katrina or the cleanup of the Gulf of Mexico shores following the British Petroleum *Deepwater Horizon* oil spill in 2010. Typical tasks for a maneuver unit in civil support operations include police augmentation, search and rescue, food distribution, and medical triage, among others. Like stability operations, platoons are best suited to accomplish these smaller tasks in order to allow the company commander to coordinate the larger effort. Company commanders are also likely to work with other government agencies, such as the Federal Emergency Management Agency or Homeland Security, to meet the goals of civil support operations.

Prior to the attacks of September 11, 2001, companies trained primarily to accomplish offensive and defensive tasks in conventional conflict. Since that time, companies have been employed in a much broader scope of operations. Recent doctrinal updates and changes to the training curriculum at the combined training centers have incorporated this reality. The current operating environment is much more complex than was the Cold War environment, but companies are still expected to remain proficient in conventional warfare tasks. The need to do both has greatly increased the demands of company command.

Successful company commanders firmly grasp the fundamentals of doctrinal tactical employment while maintaining the mental flexibility to meet a variety of challenges that they may not have been

specifically trained for. Companies are often given tasks that require additional assets beyond what they normally have, such as satellite communication equipment, forced-entry tools, or digital recording devices. Personnel and equipment are task organized to the company in this situation, adding additional training requirements prior to executing the mission. Interpreters are a key asset to any mission in the current operating environment. Predeployment training often includes working with an interpreter. An often overlooked task of company commanders is the need to train their formation in cultural sensitivity, since interpreters typically come from the local population.

Companies are the key link between the ground reality and the higher echelons to which they belong. Company commanders must be technologically and culturally adept and must be able to synthesize many pieces of information into a coherent picture of the battle space for the battalion commander. As the complexity of the operating environment continues to grow, as does the need to cover more geographic area with fewer soldiers, the company will remain an extremely important unit of organization within the military.

CONGRESS, U.S.

The U.S. Congress is the legislative branch of the federal government and plays a crucial role in the formation of national security policy. It is a bicameral legislature composed of two separate bodies, the House of Representatives and the Senate. Created

by Article I of the U.S. Constitution, Congress has a set of written responsibilities and powers, although courts and elected officials have interpreted them differently as the United States developed into a modern democracy. This entry describes how the U.S. Congress is organized, its powers, and its role in shaping U.S. security policy. Some of the defining features of Congress's impact on the military and national defense policy are (1) its central role in appropriations; (2) the Senate's confirmation of military officers and presidential appointees; (3) oversight of diplomacy, the military, and the intelligence community; (4) ratification of treaties; and (5) the power to declare war. A consistent theme in the history of Congress has been a tension with the executive branch over defense policy-making powers. In the post-Cold War era, Congress has played a prominent role in the closure of bases both at home and abroad, the Persian Gulf War, the expansion of the North Atlantic Treaty Organization, Operation Enduring Freedom, the Iraq War, U.S.-Israeli relations, and negotiations with Iran over its nuclear program. Although it is by nature deliberative, the future role of congressional defense policy making will depend on its ability to make timely and effective decisions in a world in which information travels across the globe instantaneously.

As authorized by Article I of the Constitution, Congress is organized into the House of Representatives, commonly referred to as the House, and the Senate. The House is the lower chamber and is composed of 435 members, each of them elected by voters in single member districts. The upper chamber is the Senate, which is composed of two senators from each of the 50 states. Each senator is elected directly by the state's voters. The House and the Senate have differing powers and responsibilities, although agreement among them is required to pass most resolutions and all legislation. Much of the work of Congress is conducted in House and Senate committees.

Power of the Purse

The U.S. Congress has been a pivotal institution in the development of foreign policy, defense policy, and the military since its inception. With regard to the military, foremost among Congress's policy-making roles is the power and responsibility to appropriate funds used for various purposes, for example, the

armed forces, warfighting, diplomacy, foreign aid, and intelligence. Bills that authorize spending originate in the House Appropriations Committee, the largest and most influential committee in the House of Representatives. Although the Senate must pass spending bills for them to become law, they must originate in the House. The House, therefore, has an advantageous position in the federal government regarding fiscal policy making and the funding of the armed forces—the “power of the purse.” The House Appropriations Committee is organized into several subcommittees, some of which are highly relevant to foreign and defense policy, for example, the Defense; Military Construction, Veterans Affairs and Related Agencies; and State, Foreign Operations, and Related Programs subcommittees.

Four beneficiaries of congressional appropriations are highly salient to national security matters: war funding, the development of future weapons systems, foreign aid, and military bases. War funding is the most obvious of these; while the executive branch is responsible for commanding the armed forces, Congress has the ability to shape national war strategy on the margins by funding or defunding certain aspects of a military conflict. Congress can influence grand strategy and the capabilities of the armed forces by allowing the development of new weapons systems or eliminating current ones.

Foreign aid, the domain of the House Appropriations Subcommittee on State, Foreign Operations, and Related Programs, is a prominent part of Congress's foreign policy-making influence. Spending bills for programs such as the Peace Corps, UN dues, and direct foreign aid to states such as Israel are first drafted and considered by select members of the House. Here, debates over the merits of particular foreign policies are routine.

The process of appropriating new and closing old military bases is also the domain of Congress. At the end of the Cold War, this was a politically charged issue as the Department of Defense sought to scale back expenses for its strategic adjustment. Due to the individual interests of many members of Congress, the process of base closures was heavily politicized, and the final result strayed from what the Clinton administration defined as the national interest. Some Congress members fought to keep bases open in their home districts to protect the jobs of constituents, which effectively distracted the House and Senate from the larger goal of cutting costs and

reallocating resources to more vital security interests. The placement, repurposing, and merging of military bases remain volatile issues in Congress.

Power of Confirmation

Congress has a role in the nonfiscal aspects of national security as well. The Senate has the power and responsibility to confirm presidential appointments in executive- and cabinet-level positions. Accordingly, the president must select key foreign and defense policymakers who are amenable to at least 60 senators because of the Senate cloture rule, which is a formal procedure for ending a debate and calling for a final vote on confirmation. In times of a split government, where one party controls the Senate and another is in the White House, the Senate can use the confirmation process as leverage to force the president to appoint more centrist candidates. The Senate is also responsible for confirming military officers with presidential commissions (usually at the rank of O-2 and above, depending on the branch). Senate confirmation of commissioned officers is routinely handled in an omnibus fashion; it is common to have more than 600 officers confirmed by one Senate resolution.

Oversight Powers

Congress also plays a pivotal role in the oversight of the executive branch and its civilian administration of the military, intelligence operations, and diplomacy. The House and the Senate Armed Services Committees oversee the Department of Defense and the departments of the branches of the armed forces; Senate and House Intelligence Committees oversee the entire intelligence community; and Senate and House Foreign Affairs Committees oversee the Department of State. The style and intensity of oversight depend on a host of factors, including the current committee leadership. Oversight always includes the routine testimony of department heads, sometimes held in private to protect confidential and privileged information. Pursuant to acts of Congress, the president offers periodic reports on the status of the military, grand strategy, and foreign threats through various publications, for example, the *Quadrennial Defense Review*, the *National Security Strategy*, the *National Military Strategy*, and the *National Intelligence Estimate*. More active forms of oversight include the use of legislation to

amend bureaucratic procedures and the creation of congressional investigations.

Treaties

The Senate has the power and responsibility to ratify treaties with foreign countries and must do so by a two-thirds majority vote. This puts the president in the position of bargaining with both the foreign countries and the Senate to ratify a treaty. Considering that the motivation of each senator might deviate from the president's, this congressional power can hinder international negotiations. An example is the Treaty of Versailles, which formally ended World War I and created the League of Nations. The Senate's overwhelming opposition to American membership in the League of Nations led to its refusal to ratify the treaty, thus altering American foreign policy in a significant way and potentially contributing to the cause of World War II. A more contemporary example is the Senate's refusal to ratify the Kyoto Protocol on Climate Change, which the Clinton administration signed in 1998. The unwillingness of the U.S. government to fully adopt the Kyoto Protocol contributed to increased tensions with U.S. allies in the following decade.

Declare War

By virtue of the Constitution, Congress has the power to declare war, which requires consent of the Senate and the House. There were five formal declarations of war between 1812 and 1941, although Congress has informally authorized the use of military force against foreign enemies as early as 1798 and as recently as 2002, during the approach to the Iraq War. The power and necessity to authorize the use of military force is one of the points of contention between the executive and legislative branches in the creation of foreign and defense policies.

Current members of Congress have the ability and responsibility to recommend students to the service academies, thus giving individual legislators the power to influence the composition of the armed forces' future commissioned officer corps. With the rise of the importance of Reserve Officers' Training Corps programs for supplying new officers, this reserved power is less influential than it used to be.

Finally, Congress has the ability to influence foreign and defense policy making through legislation.

One of the most influential congressional acts of the 20th century was the National Security Act (1947), which reorganized the civilian control of the military and the intelligence community and created the National Security Council. In more recent times, the Intelligence Reform and Terrorism Prevention Act of 2004 amended elements of the National Security Act and created the Office of the Director of National Intelligence. Occasionally, Congress passes legislation that alters foreign policy directly and constrains the president's options in making future foreign policy. One example is the Taiwan Relations Act of 1979, which requires the federal government to sell defensive weapons to the Republic of China (Taiwan). There are occasions when actions taken by members of Congress, apart from legislation, can influence foreign and defense policy. A 2010 non-binding resolution of the House Foreign Relations Committee that condemned the Armenian Genocide of 1911 jeopardized U.S.-Turkish cooperation on sensitive security matters in the Middle East.

As previously mentioned, the tension between the president and Congress over constitutional ambiguities largely defines their national security relationship. Chiefly, modern precedents taken by the president and by Congress have amended congressional policy-making abilities in a few substantial ways. Foremost among them is the use of the armed forces without the initial consent and authorization of Congress. Previous administrations have cited the constitutional role of the president as the commander in chief of the armed forces and the responsibility to maintain the security of the United States and its citizens. In the 21st century, it is likely that Congress's ability to declare war will be unnecessary for making war or for defending the United States and its interests. In 1973, over the veto of Richard Nixon, Congress passed the War Powers Act, a resolution that placed restraints on the president's unilateral ability to deploy armed forces and make war. Subsequent presidents have declared the War Powers Act to be unconstitutional and have challenged it in various ways.

Executive-Congressional Conflict

War making is only one way in which the executive branch has come into conflict with Congress over foreign and defense policy making. By virtue of the Constitution, executive agencies must

comply with congressional oversight requests, including responding to subpoenas and testifying under oath. At the same time, administrations have found ways to escape congressional oversight of foreign and defense policy. The assistant to the president for national security affairs (more commonly called the national security advisor) is a member of the Executive Office of the President and is therefore excluded from oversight due to the principle of executive privilege, which stems from the separation of powers principle in the Constitution. Since the mid-20th century, presidents have relied on national security advisors as confidants, defense planners, and interlocutors and emissaries to avoid having to report to Congress, thus bypassing the traditional roles held by the secretaries of state and defense. The Case Act (1972) was an effort by Congress to address this problem and requires presidents to disclose all executive agreements with foreign countries to Congress in a timely manner.

The tension between the president and Congress has multiple explanations. The dominant one is offered by the political scientist Richard Neustadt, who argued in 1960 that activist presidents since Franklin Delano Roosevelt have encroached on congressional powers because they are institutionally positioned to effectively persuade the public and have exercised strong leadership. Aaron Wildavsky's 1966 "two presidencies thesis" maintains that the president is institutionally unable to lead in domestic policy; therefore, he is overactive in foreign policy to accumulate political victories and increase his political capital. Another commonly accepted explanation for the president's successful encroachment on congressional powers is the executive's first-mover advantage; since the president has first access to intelligence, he may make policy and set a precedent before Congress has the time to act. Regardless of explanation, it is clear that the institution of the presidency has increased its ability to shape foreign and defense policy at the expense of congressional power.

Politics and National Security

While the tension between the president and Congress has been evident in one form or another since the founding of the republic, two recent trends inform the status of Congress in foreign and defense policy making since the end of the Cold War. First,

congressional elections are increasingly based on national issues instead of local issues and incumbent-constituent relations. Second, Congress's overall approval rating is at a historic low, and it continues to be blamed for many of the federal government's failings.

The dominant understanding of how members of Congress behave is best described in seminal books by David Mayhew (1974) and Richard Fenno (1978). Mayhew writes that the primary motivation of members of Congress is reelection; thus, all decisions are judged according to this singular goal. Fenno adds to this wisdom by observing that members of Congress behave differently in Congress and in their home districts. Subsequently, Fenno argues that the "home style" of members' behavior centers on serving constituents and dealing with local issues, while the "Hill style" is more amenable to national policy making. When considered together, this leads one to believe that members of Congress are most motivated to serve constituents and to solve local issues. In prior decades, this certainly was true, as constituents voted according to how well an incumbent served the local district's needs and members placed local needs before national needs. The impact that this behavior had on national security policy was clear; members of Congress would place local and parochial interests ahead of national interests, including national security.

An emerging trend in congressional elections, however, is the increased salience of national issues among voters. In 1994, Republican challengers across the country defeated well-entrenched Democratic incumbents because of voter dissatisfaction with elements of national policy. This trend has continued into the 21st century and may continue in the future. If this is the case, and if national issues are increasingly important to voters in congressional elections, then the possibility exists that members of Congress will be more respondent to the national interest and less sensitive to local constituency needs when making and amending national security policy.

The second significant trend in congressional politics is Congress's declining approval rating. Since 1975, approval ratings for the entire Congress have been low, reaching a new depth of 8% in 2009. Interestingly, this contrasts with individual members' approval ratings, which are often much higher. This trend of decreasing satisfaction with Congress indicates a general blame assigned to Congress for national problems, not just local ones. Congress is

increasingly viewed as ineffective, slow to act, and saddled with parochial interests and quid pro quo politics that cause the institution to deviate from the general good and welfare of the American people. This intense disapproval manifests itself in many ways, most notably in the public's preference for expedient presidential action on national security matters.

Congress has played a critical role in transforming national security policy in the post-Cold War era. In particular, congressional leadership was key in transforming the American military to a post-Cold War force; in authorizing the use of military force in the Persian Gulf War and other military operations; in negotiating with allies, strategic partners, and strategic rivals; in creating a new homeland security paradigm after the 9/11 attacks on the United States; in designing and authorizing Operation Enduring Freedom; and in altering the strategy of and sustaining the effort for the Iraq War.

The Post-Cold War World

The strategic adjustment of the U.S. military in the 1990s would not have been possible without the intervention of Congress. The changing threat environment, effectively a transition from a Soviet threat to a rogue state threat, required a massive shift in force posture that included the realignment of military bases and the reprioritization of weapons research, development, and funding. In the post-Cold War era, members of Congress have become more active in foreign delegations and in visits to foreign countries. Congress was a partner with the Bush administration in the creation of a new homeland security paradigm following 9/11. Landmark legislation included the creation of the Department of Homeland Security, the USA PATRIOT Act, and the authorization and funding of Operation Enduring Freedom.

Finally, the Iraq War provides multiple illustrations of Congress's role in policy making in the current era. In October 2002, it overwhelmingly authorized the president to use any means necessary to enforce the terms of UN Security Council Resolution 687, including military force. This *carte blanche* did not prove to be effective in bargaining with the Iraqi regime, but nonetheless it enabled George W. Bush to resort to a military solution to the crisis over alleged Iraqi weapons of mass destruction. In 2005, the Republican-majority 109th

Congress lacked sensitivity to public dissatisfaction over the war and continued to authorize spending bills for the war and support President Bush's policies. Consequently, the Republican Party's support for the Iraq War was cited as one of the top reasons for the success of Democratic congressional candidates in the 2006 midterm elections, thus illustrating the impact that national security issues now have on congressional elections. The 110th Congress, with a Democratic majority, had a mandate to curtail the war effort but did not, partly due to its weak institutional position relative to the Office of the President. Despite opposition from the Democratic Congress, the Bush administration's troop surge in 2007 added more than 27,000 military personnel, thus striking a blow to the legislative branch's perceived authority on national security issues.

The 112th Congress, which was divided between a Democratic Senate and a Republican House, faced renewed policy-making challenges that reflected the trends seen in recent decades. In a climate of renewed fiscal austerity, it has pursued a reduction in programs that have the potential to shift defense policy in the long term. Foremost among these developments are significant reductions in foreign aid and deep cuts to the Department of Defense budget.

The 113th Congress faces a variety of classic and newly emerging challenges in the realm of foreign and defense policy. Among those issues inherited from the previous Congress include a climate of renewed fiscal austerity and a severe lack of bipartisanship. A lack of agreement between Republicans and Democrats over the future of the government's fiscal policy threatens existing programs and suppresses new policy initiatives. Foreign aid spending is a routine target of budget hawks. Obama administration officials have warned that deep cuts to the defense budget will jeopardize current and future military readiness. In the long term, the cancellation of key weapons systems like the F-35 Joint Strike Fighter may affect force projection and necessitate a change in grand strategy.

While budget battles are nothing new to the Congress, the protean landscape of threats to national security presents a host of newly emerging challenges. Skeptics from both parties are concerned that the Obama administration's increased reliance on drone strikes and the lack of transparency therein is eroding Congress's ability to oversee the conduct of the Global War on Terror. Legislators are divided over the

president's "Asia Pivot" strategy, which remains more of an idea than an actual policy. After recent attacks on public and private sector systems, cyber security has become a high priority, yet funding and oversight plans have not been fully developed. The new century presents a rapidly changing strategic environment that the Congress must react to in a timely and efficient manner. The alternative is to abdicate more of its foreign and defense policy-making powers and responsibilities to the executive branch.

CONGRESSIONAL RELATIONS, MILITARY

This entry discusses the constitutional and statutory complexities associated with free exchange of information and appropriation requests between the military and members of Congress. "Congressional relations in the military" is an abstract term that is neither constitutionally nor statutorily defined. To compound matters, the Anti-Lobbying Act of 1919, codified at 18 U.S.C. 1913, creates a dichotomy where the military is prohibited from lobbying members of Congress and is also under a duty to provide timely information to Congress related to military programs and corresponding appropriations requests. As stated in 18 U.S.C. 1913,

No part of the money appropriated by any enactment of Congress shall, in the absence of express authorization by Congress, be used directly or indirectly to pay for any personal service, advertisement, telegram, telephone, letter, printed or written matter, or other device, intended or designed to influence in any manner a Member of Congress.

This language prevents federal agencies, including the military, from using their employees, resources, or appropriated funds to lobby any federal, state, or local government official with respect to military programs or appropriations. In fact, the act initially criminalized lobbying of Congress by federal agencies but was revised in 2002 to merely prohibit such lobbying activities.

However, 18 U.S.C. 1913 seems to contradict the antilobbying provision by providing that this section

shall not prevent officers or employees of the United States or of its departments or agencies from communicating to any such Member or official, at his request, or to Congress or such official, through the proper official channels, requests for any legislation, law, ratification, policy, or appropriations which they deem necessary for the efficient conduct of the public business.

Indeed, members of the military are mandated by the act to respond in a timely fashion to any inquiries or requests by members of Congress that might be related to legislation, appropriations, or other military programs. Understandably, the prohibitory and mandatory language is contradictory. How can members of the military avoid the appearance of lobbying, either formal or informal, while responding to congressional inquiries related to military programs and corresponding appropriations without actively supporting their requests? The act by its very nature creates an environment where members of the military are under a duty to explain and even advocate support for military operations and corresponding appropriations.

Further complicating this dichotomy is the fact that military operations are often cloaked in secrecy. Fully explaining the military's budget to members of Congress could easily violate matters of national security. Some top secret military projects may even avoid the scrutiny of an Open Records Act subpoena.

In addition, educating all members on all extremely complicated and highly scientific military projects would be virtually impossible. As a partial remedy, classified documents are revealed only to key members of Congress who have top secret clearances and sit on select congressional committees. Even with committee access, full disclosure and complete transparency are unreasonable in that military projects are massive. Explaining in detail the combined military budget for 2012, a budget in excess of \$600 billion, to members of Congress would be virtually impossible.

Even so, Congress ultimately holds the purse strings for military appropriations and demands transparency when approving requests for appropriations. Constituents demand accountability and want to know why a hammer or screwdriver might cost much more than \$100. Anticipating reelection, members of Congress request transparency, justification, and supporting information from military leaders to enable them to approve, cut, or increase military budgets. Frequently, this natural flow of information and congressional oversight create congressional relations with the military that are difficult, if not impossible, to distinguish from an aggressive lobbying campaign.

Congress not only condones but also demands information, services, and assistance. Replies to congressional inquiries are expected in a timely fashion. Over time, members of Congress build relationships and trust with key members of the military. This statutorily mandated interaction and exchange of information naturally create a rich opportunity for members of the military to lobby for military operations and corresponding budget requests. Thus, the dichotomy created by the act's language is difficult to differentiate. There is no clear-cut line of demarcation between military lobbying and the military's duty to provide timely information to Congress.

Brief History

To better understand the current state of congressional relations with the military, one must first examine the "separation of powers" provision established by the U.S. Constitution. Article I, Section 8 of the U.S. Constitution requires the legislature "to raise and support armies" and "to make rules for the government and regulation of land and naval forces." This clause clearly establishes the authority

of Congress to regulate and fund military programs. In addition, it creates the authority of Congress to exercise oversight of military affairs and corresponding appropriations requests.

To create balance and separate powers, Article II of the U.S. Constitution establishes the executive branch of government and vests full executive power in the president of the United States. Article II, Section 2 of the U.S. Constitution provides that “the President shall be Commander in Chief of the Army and Navy of the United States, and of the militia of the several States, when called into the actual Service of the United States.” Equally clear, the president is in charge of the military.

As such, another dichotomy is created. The president is empowered with authority over and responsibility for the military, while Congress is empowered with the authority to raise, support, and regulate the military. In accordance with the Budget and Accounting Act of 1921, the president is authorized to submit a budget with supporting justification to Congress each year. In turn, Congress is vested with the power to investigate budget requests and corresponding justification for related military spending. Through such checks and balances, the framers of the Constitution provided for a national military defense while minimizing the possibility of the national military becoming uncontrollable. The president commands the military, but without Congress there is no funding of the military.

This bifurcated system naturally creates an opportunity, if not a duty, for Congress to investigate and ultimately micromanage military operations through the approval or denial of requested appropriations. Understandably, such bifurcation often creates a deep frustration in military leaders. Military leaders tend to view their needs from a national or even global perspective, with virtually no ties to their home state. In contrast, members of Congress are tied to their home state, realizing that the constituents who vote them into office can also vote them out of office. These electoral ties frequently lead to pork barrel legislation geared toward bringing money, jobs, and military bases into their representative economy—thereby solidifying reelection—when, in fact, some of these initiatives are not requested or even desired by members of the military.

Similarly, money, jobs, and military bases attract the attention of political action committees (PACs). The defense portion of the federal budget consumes

25% of the nation’s tax dollars. As a consequence, defense contractors actively use the intricate political machinery of PACs to gain the attention of the appropriate legislator necessary to secure funding of operations. In turn, PACs contribute almost one third of all the money raised by congressional representatives. Their influence on congressional representatives, and ultimately military appropriations, cannot be understated.

PACs also generate relationships with key members of the military. Although all branches of the military report to the president as commander in chief and all branches of the military are coordinated by the secretary of defense, each branch of service actively competes for its share of declining defense budgets. Each branch of the military has a vested interest in providing PACs and Congress with information related to current and future expenditures for military operations. This fragmentation creates competing interests and makes a full overview of congressional relations with the military somewhat difficult to imagine. To fully understand the term *congressional relations in the military*, one must examine the organizational design of the military.

Organizational Design

As enumerated in Article II of the U.S. Constitution, the president as commander in chief of the military ultimately dictates military operations and congressional relations with the military. Supporting the president, the secretary of defense is responsible for coordinating the combined needs of the competing branches of the military. The secretary, through the general counsel for the Department of Defense (DOD), submits and sponsors the authorizations bill and the defense appropriations bill to Congress. This legislation represents the DOD’s coordinated funding and program requirements for the military. Forwarded to the Speaker of the House, bills are submitted to the scrutiny of the House Committee on National Security (HCNS); the Senate Committee on Armed Services (SASC); the House Committee on Appropriations, the National Security Subcommittee (HAC/NS); and the Senate Committee on Appropriations, Defense Subcommittee (SAC/D). These committees hold posture hearings for a “State of the Union” for each branch of the military and specific-purpose hearings for various military projects. In accordance with the differing committee

requests, the secretary of defense, the chairman of the Joint Chiefs of Staff (JCS), commanders in chief of the Unified Commands, and other witnesses testify to explain and justify the combined requests and needs of the branches of the military.

In addition, DOD Directive 5132.1 (July 1982) charges the assistant secretary of defense with the responsibility of being the “principal staff assistant to the Secretary of Defense for DOD relations with Congress.” In accordance with DOD Directive 5400.4 (January 1978), this individual serves as the key legislative liaison charged with the duty to ensure that members of Congress “receive adequate information concerning all Government programs and operations” and that all DOD components “make maximum information available to and cooperate fully with, members of Congress and congressional committees and their staffs.”

Through such positive relationships and open communications, members of Congress are able to gain a greater understanding and appreciation of military appropriations and corresponding programs. The underlying demand for national security dictates a nonpartisan view of the legislation, but as stated earlier, constituent interests often cloud congressional judgment. One such example was the \$3 billion earmarked for an alternate engine for the Joint Strike Fighter Program in 2010. Although the Pentagon never fully sanctioned the project, it was approved by Congress because fighter jet engines create jobs and stimulate the economy, thereby satisfying PAC dollars and easing reelection concerns.

In contrast, the JCS attempt to arm the president and the nation with information related to the needs of the military. The JCS advise the president and Congress of military operations and corresponding budget requests; however, according to the Goldwater-Nichols Act of 1986, they do not have operational command of U.S. military forces. Responsibility for conducting military operations is vested by Article II of the U.S. Constitution in the President of the United States, who coordinates military operations through the secretary of defense, who, in turn, directs the commanders of the Unified Combatant Commands, thus bypassing the JCS.

However, the JCS has enormous influence on the president, the secretary of defense, and the legislature. In accordance with 10 U.S.C. 151, the JCS is statutorily composed of the chairman and vice chairman (appointed by the president), the chief of

staff of the army, the commandant of the Marine Corps, the chief of naval operations, and the chief of staff of the air force. Within this structure, the JCS acts in a military advisory capacity for the president, the secretary of defense, and the legislature. Understandably, this advisory capacity allows the JCS to play a major role in influencing existing and future programs in the military.

Even more powerful than PACs or the JCS is the contingent of approximately 100 career military officers who work inside Congress. Paid by the Pentagon, these individuals are loaned through fellowship and staff programs. They provide *timely information* to members of Congress, thus sidestepping what could easily be called a lobbying effort. They also assist in writing bills that allocate billions of dollars for military needs each year. Although their service is not considered lobbying, these military leaders who are *detailed to Congress* provide *timely information to members of Congress*. Frequently, this information flow includes “fact sheets” that outline the military programs, include justification for the programs, and include accompanying budget requests. Working on 7- to 12-month fellowships, these military leaders lubricate on a daily basis the congressional machinery that ultimately results in approval of military programs and budgetary needs.

Moreover, some of the most influential military leaders are assigned to House committees. In this position, the “detailees” build personal relationships, are trusted, and even become friends who interact with close family members. As such, their formal and informal authority in drafting and supporting military needs is insurmountable. Unlike lobbyists, these fellows and detailees have continual and immediate access to members of Congress.

Conclusion

Due to constitutional and statutory constraints, *congressional relations in the military* is a very elusive term. The appearance of lobbying on behalf of the military is sidestepped by fancy terms such as *congressional liaison*, *legislative service*, *fellowship*, or *detailee*. But the ultimate outcome is the same. Direct contacts between members of the military and members of Congress are established, and support for military programs and accompanying budgets is obtained.

Truly, Articles 1 and 2 of the U.S. Constitution create an uneasy dichotomy whereby Congress

“co-manages” the military and the military has a duty to provide timely information and responses to congressional inquiries. Certainly, this places the military in the awkward position of selling their programs and respective budgets without being biased or violating the Anti-Lobbying Act of 1919. Because Congress requests the special knowledge and expertise of seasoned military leaders to explain their views on pending proposals, there is virtually no way to distinguish dissemination of information and responsiveness to congressional inquiry from lobbying. As a consequence, members of the military are flummoxed by the diametrically opposite dictates created by the Anti-Lobbying Act of 1919 to provide timely information to Congress regarding military programs and appropriations without creating the appearance of lobbying.

CONSCIENTIOUS OBJECTION

Throughout U.S. history, there have been those who, on principle, refused to bear arms when faced with compulsory military training or service. This entry discusses conscientious objectors (COs) in the United States, from the 1600s to the present.

The Colonial Era to the Civil War: Religious Objectors

The Religious Society of Friends, or Quakers, who came to America in the late 1600s and established the colony of Pennsylvania, was the first group to

practice conscientious objection in the New World. These religious sectarians, firmly dedicated to traditional Christian beliefs and characterized by the desire to remain apart from governmental authority, established in the British colonies a social commitment to the importance of organized peace and nonviolence. During the Revolutionary War, conscientious objection was widely practiced by Quakers and other religious pacifist sects, such as the Mennonites and Brethren, who also settled in the Middle Colonies in the early 18th century. When, for the first time, Pennsylvania enacted a compulsory draft in March 1777, there was no region under the new government's rule where conscription was not enforced. Quakers were unqualified in their opposition to compulsory service, and even if they had the money to pay for their exemption, they refused to do so. The authorities seized property from resisters who chose not to pay. By the conclusion of the war, the core of conscientious nonresistance centered in what came to be called the Historic Peace Churches—the Pennsylvania Anabaptist remnants (Mennonites and Church of the Brethren) and the 50,000 Quakers who were scattered in nearly 80 meetinghouses throughout the colonies. In 1790, James Madison proposed protection for religious objectors in the Bill of Rights, but the Senate rejected the measure.

The Civil War presented the next serious challenge to COs. Both the Union and the Confederacy provided limited exemption from military service for religious objectors from traditionally pacifist sects. Union congressional action permitted exemption to Quakers and other Peace Church members for a \$300 fee. Yet most northern war objectors considered these concessions insufficient. Consequently, some were jailed for refusing to serve or to obey military orders when forcibly inducted into the army. In February 1864, however, the Lincoln administration permitted religious pacifists to do hospital work as an acceptable alternative to bearing arms. In the South, because of lobbying by Quakers, Mennonites, and Brethren, the government eventually agreed to exempt religious objectors on the condition that they pay \$500 for this privilege. A small number refused to take this way out and, after induction into the army, suffered hardships, including the application of torture that was more brutal than that meted out to northern COs. The Confederacy's urgency for more soldiers resulted in stiffer measures.

World Wars I and II: Noncombatant Roles

In World War I, the Selective Draft Act of 1917 officially recognized only members of the Historic Peace Churches as COs. However, they were required to serve in noncombatant military roles. Apart from the 4,000 classified as COs, and eventually furloughed into agricultural work, approximately 20,873 were granted noncombatant classification by their local draft boards. Some 450 “absolutists,” however, refused to cooperate with the government and were convicted and sent to military prisons, where they endured various forms of brutal punishment. When COs arrived at an army camp, the general practice was to get as many of them as possible to accept combatant duty. Labeling them as cowards and shirkers, military officials used all kinds of pressures to break the convictions of the objectors. After receiving a scathing report regarding the treatment of many of the absolutists, President Woodrow Wilson issued an executive order banning all forms of physical punishment.

The harsh and often brutal treatment meted out to COs during World War I led to a more liberal policy during the Second World War. The Selective Service Act of 1940 permitted CO status for all religious nonresisters. A choice was provided, which entailed non-arms-bearing military service or working in Civilian Public Service camps. From 1940 to 1945, some 50,000 eligible draftees received CO classification, and most served in the military medical corps. However, close to 12,000 opted for alternative service—doing construction jobs, working in state hospitals, reforestation, and agricultural experimentation—in the 70 Civilian Public Service camps scattered throughout the country. These camps were operated by the Historic Peace Churches on behalf of the Selective Service System. However, some 5,000 absolutists, mainly Jehovah’s Witnesses, were sent to federal prison.

The Cold War and Beyond: Antiwar Organizations

The early years of the Cold War kept the draft in effect, which witnessed the largest peacetime military in U.S. history. During the Korean War (1950–1953), 4,300 were classified as COs. In the 1960s, during the Vietnam War, massive numbers of secular and religious men applied for CO status. Antiwar organizations, such as the War Resisters League

(founded in 1923), the Fellowship of Reconciliation (originally founded in Great Britain in 1914 and then an American branch established at a conference in Garden City, New York, the following year), the National Interreligious Service Board for Conscientious Objectors (1940), and the Central Committee for Conscientious Objectors (1948), were successful in challenging the government to grant wider latitude with respect to refusal to bear arms. This was due, in part, to the larger number of well-to-do and college-educated males willing to challenge the constitutionality of conscription in connection with this war. Consequently, Supreme Court cases such as *United States v. Seeger* in 1965, *United States v. O’Brien* in 1968, and *Welsh v. United States* in 1970 changed the criteria for CO status to include secular or moral beliefs, not just religious. Between 1965 and 1970, some 170,000 draft registrants were classified as COs. In-service applications for CO status, moreover, increased from 829 in 1967 to 4,381 in 1971. Throughout the course of U.S. military involvement in Southeast Asia, from 1965 to 1973, close to 17,500 service members applied for noncombatant status or discharge as COs.

The end of the Vietnam War also saw elimination of the draft. However, compulsory male registration was reenacted in 1980. When close to 500,000 failed to register between 1982 and 1984, the Reagan administration chose to prosecute some who publicly refused to register. This approach was not very successful and was replaced by the Solomon Amendment, which denied students financial assistance from federal funds for failing to register for the draft on reaching the age of 18.

The 1990s to the Present: COs in an All-Volunteer Force

The creation of an all-volunteer military was designed in part to address the problems associated with compulsory conscription. In 1990–1991, however, the Persian Gulf War reignited the issue of conscientious objection for those serving in the armed forces. From 1988 to 1991, according to Department of Defense statistics, the army processed a total of 408 applications and approved 298, for a 73% approval rating. The largest increase took place during the Persian Gulf War, with 229 applications and 140 approved. The Marine Corps

processed 178 applications with 59% approved. The Persian Gulf War witnessed 92 processed and 43 approved. The air force had a total of 158 processed and a 78% approval rate. The Persian Gulf War saw 48 applicants with 31 approved. Navy applications were 264 with 79 approved, excluding officer applications (8 officer applications were approved during this 4-year period). During the Persian Gulf War, 78 applications were processed and 59 approved. The navy had the highest approval rate during the Persian Gulf War. Despite the shortness of this conflict, 648 persons in regular and reserve military units sought discharge as COs during Operations Desert Shield and Desert Storm. The army either reassigned or released many, while the Marine Corps court-martialed and imprisoned almost 50%. Overall, during this 4-year period, the military processed a total of 1,008 applications for CO status and approved 736.

During the Persian Gulf War itself, 447 applications were processed and 273 approved. The short duration of the conflict cut short the number of applications, which more than likely would have increased otherwise. This accounted for a 61% approval rating, down from the overall 73% approval rating during the period from 1988 to 1991. During the Gulf War, those applying for CO status had two options: 1-0, requesting full discharge, and 1-A-0, seeking assignment in a noncombatant role. During the Persian Gulf War, the basic steps for processing CO applications included the appointment of an investigating officer, interviews with a chaplain and a psychiatrist, a hearing, preparation of a report by the investigating officer, and submission of the report with recommendations through a chain of command. Army regulations do not permit discharging applicants willing to serve out their remaining obligated service in a noncombatant status; the navy permits enlisted personnel to serve out their remaining obligated service in noncombatant status; the air force and marines routinely discharge such personnel. The processing of applications ranged from a few months to more than 4 years. Approximately 88% of the applicants were in the 21- to 25-year-old age-group. Approval for enlisted personnel was significantly higher than for officers.

The war in Iraq, which saw the last American troops withdraw in December 2011, and the ongoing conflict in Afghanistan have resulted in service personnel applying for exemption based on conscience. Presently, slightly more than 25,000 soldiers

have deserted the military since 2003, and 225 have fled to Canada. However, those applying for CO status are a far smaller number. In 2006, for instance, the army reported only 42 applications, of which 33 were approved. Critics argue that these numbers are artificially low because they reflect only those soldiers who actually completed the arduous application process. Nevertheless, there have been a number of highly publicized cases of combat veterans who sought CO status, some involving court-martial and imprisonment as well as desertion to Canada. Among them were Army Lieutenant Ebran Watada; Army Staff Sergeant Camilo Mejia, the first public Iraq War resister and now a pacifist, who spent 9 months in prison at Fort Sill, Oklahoma; Brandon Hughly of the 1st Cavalry; Marine Staff Sergeant Jimmy Massey; and Jeremy Hinzman, an 82nd Airborne Ranger who served in Afghanistan. According to the latest Government Accountability Office report released in 2007, from 2002 to 2006, the military processed 425 CO applications from active and reserve components. Of that number, 224 (53%) were approved; 188 (44%) were denied; and 13 (3%) were pending, withdrawn, or closed, or no information was made available. The actual numbers of applicants is probably underreported, however, due to the difficult application process itself as well as due to peer pressure within the military discouraging personnel from applying. While the most current statistics related to war resisters in Afghanistan are yet to be updated (the only available accounting by the Department of Defense remains a 2007 report for both conflicts), various news and online reports have noted that as of July 2009, some 28 publicized cases of war resisters residing in Canada were soldiers who had served in both Iraq and Afghanistan. There are 2 other cases highlighting resistance to the Afghan War that have recently received media attention. One is a 2011 case, still pending, involving Private First Class Naser Abdo, a Muslim soldier from Texas. Abdo, assigned to the 101st Airborne at Fort Campbell, Kentucky, has refused to be deployed to Afghanistan and is seeking CO status on religious grounds because of his Muslim faith. In February 2012, U.S. Army Specialist Dan Birmingham successfully won his appeal as a CO and received an honorable discharge. When notified that he would be redeployed to Afghanistan after having served previously in combat in the Middle East, he applied for his discharge from the military as a CO.

Furthermore, the issue of female COs has surfaced during the nation's current wars in the Middle East. One case involved Kimberly Rivera, who served in Iraq in 2006 and then fled to Canada with her family after refusing redeployment. Another case is that of Army National Guard Specialist Katherine Jashinski, who received a Bad Conduct Discharge and 120 days' confinement for refusing deployment to Afghanistan in 2006.

While the number of military personnel applying for CO status remains in flux and is not fully documented due to the ongoing nature of the Global War on Terror, nongovernmental organizations like G.I. Rights are working with the Center for Conscience and War advising service members regarding military discharge and complaint procedures. Those seeking CO status are requested to complete a 22-question form and undergo an interview with a military chaplain, a psychologist, and an investigating officer. To receive CO status, they must demonstrate how their beliefs have changed since entering the military, a slight revision since Operation Desert Storm. Military recruitment of poor youths in urban areas—"poverty draft"—constitutes the fastest growing contingent applying for CO status.

The evolution of conscientious objection from strictly religious principles to secular and moral considerations marked a turning point in political and ethical thought in 20th-century U.S. history. Nevertheless, the establishment of an all-volunteer force has not diminished the struggle between freedom of conscience and obligation to the state. The present wars in Iraq and Afghanistan are merely a prelude for future military personnel who will grapple with the conflict between their duties as a soldier in time of war and matters of individual conscience.

CONSCRIPTION

Conscription is the authority of government to compel people, usually free adult male citizens, to serve in the military. The U.S. Constitution authorized Congress to maintain an army and a navy, and assumed states would maintain militia. The federal government was empowered to assume control of the militia to repel invasions, enforce laws, or suppress insurrections. The federal government relied on voluntary enlistment for the Regular Army and Navy, while the Militia Act of 1792 called for states to enroll most free adult men in geographically

organized militia companies for training. In practice, the Militia Act was ignored, and states instead depended on volunteer companies for traditional militia functions or to augment the federal military during wartime. This entry discusses the history of conscription in the United States.

Federal Conscription

Conscription, also called the *draft*, first appeared in the United States during the Civil War, when the Confederate government (1862), followed by the Union government (1863), passed laws that allowed their armies to force individuals to serve, although conscripted men could purchase a substitute if they could afford it. States that raised enough volunteers through incentives were spared conscription. The use of soldiers with the authority to compel military service ran counter to American emphasis on civilian control and volunteerism. The results were poor, with only a small minority of soldiers on both sides entering the military through conscription, and those who did become objects of contempt for volunteers. The Civil War experiment with conscription did not raise constitutional issues as the use of conscripted soldiers to suppress insurrection fell within the constitutionally sanctioned use of the federal militia. During the Spanish-American War (1898), Congress declared that all men 18 to 45 years of age were subject to military service, but the large numbers of volunteers and short duration of the war made such a provision unnecessary.

When the United States entered World War I, the government decided to use conscription to greatly expand the small Regular Army and the National Guard into the mass army required for the war. After studying the failure of conscription during the Civil War, the government created the Selective Service System, which was run by civilians at the community level. Constitutionally, the new conscription was based on two premises. First, the Constitution gave Congress specific authority to “raise and support armies,” without restrictions on how those armies were raised. Second, a declaration of war by Congress had the force of law, and thus using conscripts in a declared war fell within the bounds of the constitutionally sanctioned role of the federal militia in enforcing laws. Selective Service committees, informally called *Draft Boards*, considered the health, number of dependents, and role in the

economy of a potential selectee before placing him in a category. In the summer of 1917, the government ended all voluntary enlistments and depended entirely on conscription. Conscription ended with the Armistice in November 1918, and the American military again depended on individual volunteers.

In November 1940, in response to the growing wars in Asia and Europe, Congress passed the Selective Training and Service Act, the nation’s first peacetime conscription. The new Selective Service System was almost identical to that used in World War I, although voluntary enlistment was also allowed. Men between the ages of 21 and 35 were eligible for conscription. Before the United States entered World War II, selectees were to train for 1 year and were not to serve outside the Western Hemisphere or American possessions in the Pacific. The length of service was later extended to 18 months, but the United States entered the war before the selectees were discharged, and all selectees were ordered to serve as long as they were needed. In 1943, the minimum age was lowered to 18. During World War II, some 12 million men entered the military through Selective Service.

The Cold War

After World War II, the United States relied on a mixture of volunteers and conscripts to fill its military. The 1940 Selective Service Act expired in January 1947, but Congress passed a new act in March 1948, subjecting men 19 to 26 years of age to fill the undermanned army. President Lyndon Johnson’s desire to maintain middle-class support for the war in Vietnam led to a number of programs that allowed wealthy and better educated men to avoid conscription. As a result, disproportionate numbers of poor, minority, and young men were drafted. Widespread opposition to conscription during the Vietnam War ended the national consensus on compulsory military service. In 1972, conscription ended, although congressional authority for it remained into 1973. Since 1972, the United States has depended on the all-volunteer force. In 1980, President Jimmy Carter reinstated registration with Selective Service for men between 18 and 25 years of age, although no conscription took place. Congress has continued to fund Selective Service at a basic level in order to preserve the mechanism for a draft.

Global War on Terrorism

Following the terrorist attacks on the United States on September 11, 2001, the United States began a long war in Afghanistan and, later, Iraq. The war was fought using the all-volunteer force, with heavy involvement by the reserves and the National Guard. Additionally, the U.S. military increasingly depended on private contractors to perform traditional military functions from food service to providing security. Despite rare and isolated calls from pundits for a new draft, the Department of Defense, Congress, and major political parties have shown no inclination to abandon the all-volunteer force. The utility of a revived draft is questionable. The 20th-century draft answered a need for a mass, infantry-based army of citizen-soldiers, serving largely for the straightforward goal of defeating the armed forces of enemy nation-states. Post-Cold War military operations are more nuanced, calling for smaller armies of long-term professionals. Any modern draft would either be so massive as to absorb an inordinate amount of military resources to house, equip, and train these reluctant short-term soldiers or be so patently unfair as to make it politically unsustainable. Most serious proposals for some sort of mandatory service include nonmilitary service options.

CONSTITUTION, U.S.

The U.S. Constitution outlines the structure of the U.S. government and describes its powers and limits. The 55 delegates who framed the document in

Philadelphia in the summer of 1787 sought to overcome the failures of the Articles of Confederation. It had not provided for an independent executive, and it vested primary power in the states, which acted in some matters as independent nations. George Washington, the president of the Constitutional Convention and the first president of the United States, had set a great example of civil-military relations by subordinating his command over U.S. forces during the Revolutionary War to Congress and by resigning his command at the end of the conflict. This entry outlines the Constitution, discusses the powers that the Constitution delegates to the three branches of the national government, and examines the U.S. Supreme Court cases that pertain to the U.S. military and to congressional and presidential powers relative to foreign affairs.

The Constitutional Principles and Outline

The Preamble to the Constitution lists providing “for the common defense” as one of its primary goals. The document established a system of checks and balances designed to safeguard liberty by dividing power vertically between national and state authorities (federalism) and horizontally among the legislative, executive, and judicial branches (separation of powers). The people elect the legislative and executive branches, and the president appoints members of the judiciary with Senate consent.

The Constitution vests the national government with exclusive power over foreign affairs. Even the strongest advocates of states’ rights emphasize matters such as property, welfare, education, and policing. After the Constitution lists the powers of Congress in Article I, Section 8, it limits these powers in Article I, Section 9. Article I, Section 10, in turn, lists limits on the states. The first 10 amendments, known as the Bill of Rights, subsequently limited the powers of Congress, and the Fourteenth and other amendments limited the states’ powers.

Many of Article I, Section 10’s limits on the states focus specifically on matters involving foreign affairs. The Constitution prohibits states from signing treaties, entering into foreign alliances, levying imposts or duties, or engaging unilaterally in war unless invaded or facing imminent danger. *Crosby, Secretary of Administration and Finance of Massachusetts v. National Foreign Trade Council* (2000) confirmed that state laws restricting trade

First page of the U.S. Constitution, 1787.

with Burma were subordinate to congressional legislation.

Powers of the Three Branches

The first three articles of the U.S. Constitution respectively outline the powers of the legislative, executive, and judicial branches. The Constitution divides powers relative to military affairs between Congress and the president. The judiciary polices the boundary between them by exercising the power, called judicial review, to declare laws and governmental actions to be unconstitutional.

Many of the powers that the Constitution delegates to Congress in Article I, Section 8 deal with military matters. These include the power to “define and punish Piracies” and “Offenses against the Law of Nations,” the power “to declare War,” the power to raise and govern armies and navies (the basis for the Code of Military Justice), and the power to call out the militia and to organize, arm, and discipline it. The Constitutional Convention decided to grant Congress the power to “declare” war rather than to “make” it, but congressional “powers of the purse,” which include the power to tax, spend, and borrow, give it additional control. Article I, Section 9 allows for the

suspension of the writ of habeas corpus (requiring the government to specify charges against incarcerated individuals) in times of “Rebellion or Invasion” when the public safety so requires. Congress helps oversee military matters through its implied power to conduct investigations. The two houses of Congress share most powers, but as a smaller body whose members had longer terms, the Founders expected the U.S. Senate to play a special role in foreign affairs, and the Constitution specifically granted it the power to confirm presidential appointments and to ratify treaties.

In listing presidential powers, the Constitution begins with an office and names the president as “commander in chief” of U.S. forces. This power is often called “the power of the sword.” Most of the president’s power over military affairs stems from this single power, although others are listed. The Constitution thus vests the president with the power to execute the law and to make treaties with the approval of two-thirds of the Senate. The president also appoints members of the cabinet, including heads of the Departments of Defense and of State, and foreign ambassadors. *Myers v. United States* (1926) and other decisions have confirmed that this includes the right to fire such officials without Senate approval. This power extends to military officers, as President Harry S. Truman confirmed when he fired General Douglas MacArthur during the Korean War.

Whereas some nations have separate heads of state and heads of government, the U.S. Constitution merges both functions in the office of the president. Article II, Section 3 thus specifically recognizes that the president “shall receive Ambassadors and other public Ministers.” The president’s role in receiving ambassadors, representing the U.S. on trips abroad, and performing symbolic functions enhances the power of this office.

The Constitution grants the judiciary oversight over all cases that arise under the Constitution, its laws, or treaties made under its authority, including cases of “admiralty and maritime Jurisdiction.” The U.S. Supreme Court hears most of its cases, including cases from the U.S. Court of Military Appeals on appeal. However, the Constitution specifically vests the Court with original jurisdiction over cases “affecting Ambassadors, other public Ministers and Consuls.”

Military Powers Directed Abroad

Congress has the power to declare war, but it is a much more complex and unwieldy institution than

the presidency. Although it has authorized the use of force in other situations, such as the two recent wars in Iraq, Congress has only officially declared war on five occasions—the War of 1812, the Mexican-American War, the Spanish-American War, World War I, and World War II. Moreover, the president’s actions as commander in chief can provoke war or otherwise influence its progress. President Truman justified sending U.S. troops to oppose North Korea’s invasion of South Korea under a UN mandate, and treaties served in part (along with the Gulf of Tonkin Resolution of 1964) to justify U.S. intervention in Vietnam.

The Court sometimes declares the question of which branch has the requisite authority in matters of foreign affairs to be a “political question” for the branches to resolve between themselves. Notably, four justices took this stance in *Goldwater v. Carter* (1979), which refused to grant standing to members of Congress challenging President Jimmy Carter’s decision to terminate a treaty with Taiwan unilaterally. Similarly, in *Luther v. Borden* (1849), the Court refused to second-guess a decision by President John Tyler as to which side he would aid in a conflict between two rival governments in Rhode Island. During the Civil War, a majority of the Court in the *Prize Cases* (1863) approved President Abraham Lincoln’s blockade of southern ports in the absence of a declared war, although the decision was muddled by Congress’s retrospective approval of the blockade.

The Court has often deferred to presidential exercises of war powers. In *J. W. Hampton and Co. v. United States* (1928), the Court upheld a congressional law granting the president the power to alter tariff rates in certain circumstances. In *United States v. Curtiss-Wright Export Corp.* (1936), Justice George Sutherland’s majority decision, quoting an earlier speech by John Marshall, declared the president to be the “sole organ” of American foreign policy and ruled that the president could, with congressional preapproval, impose embargoes, even though the Court had invalidated similar delegations of congressional powers in domestic affairs.

In upholding a treaty with Britain over migratory birds in *Missouri v. Holland* (1920), the Court suggested that it might ascertain the constitutionality of treaties differently than other laws, but subsequent decisions have subjected such treaties to constitutional restraints. Presidents sometimes bypass the need for two thirds of the Senate to approve treaties by entering into executive agreements with foreign countries. Both *United States v. Belmont* (1937) and

Dames and Moore v. Regan (1981) upheld the constitutionality of such agreements, which are often sanctioned by laws or treaties.

Congress attempted to restrain presidential powers in the War Powers Resolution of 1973. This law required the president to consult with congressional leaders when introducing troops into harm's way, gave him or her 48 hours to notify the full Congress of such actions, and limited the deployment of new troops without congressional authorization to 60 days (with another 30-day emergency clause). The law may have increased transparency, but no president has fully embraced it, and the Supreme Court has never ruled on its constitutionality.

Military Powers Directed Inward

The Supreme Court has been more willing to intervene in cases where exercises of military powers affect domestic life. Acting as a circuit judge, Chief Justice Roger Taney sought to limit President Lincoln's suspension of the writ of habeas corpus during the Civil War. Invoking constitutional provisions for jury trials, in *Ex Parte Milligan* (1866), the Court invalidated the conviction of a civilian Confederate sympathizer by a military court. In *Arver v. United States* (1918), however, the Court ruled that the congressional power to raise armies included the power to use a draft; in *Hamilton v. Kentucky Distilleries & Warehouse Co.* (1919), the Court used the war powers provisions to allow for the continuing imposition of the War Time Prohibition Act; and in *Rostker v. Goldberg* (1981), it permitted Congress to restrict compulsory registration to males.

In *Ex Parte Quirin* (1942), the Supreme Court upheld the conviction by a military tribunal of Nazi saboteurs who had landed in the United States. Similarly, in *Hirabayashi v. United States* (1943), the Court validated curfews for Japanese Americans during World War II, and in *Korematsu v. United States* (1944), it deferred to questionable military judgment and approved their exclusion from U.S. military zones on the West Coast, from where they were carried to detention camps. In *New York Times Co. v. United States* (1971), the Court cited First Amendment press freedom to deny the president the power to block publication of the Pentagon Papers, which delineated the sometimes unsavory history of U.S. involvement in Vietnam. When limiting a

president's executive privilege to withhold information involving possible domestic criminal matters in *United States v. Nixon* (1974), however, the Court indicated that it would have been more deferential if military secrets had been involved.

When President Truman seized U.S. steel mills to avert a strike that he thought threatened the production of arms for the Korean War, the Court invalidated his action in *Youngstown Sheet & Tube Company Co. v. Sawyer* (1952). The Court majority said that this was too far from the theater of war to be justified under his power as commander in chief. In a notable concurring opinion, Justice Robert Jackson argued that presidents had the greatest power in foreign affairs when acting with congressional authorization, they had the least power when acting against it, and they were in a "twilight zone" when acting without either authorization or disapproval—in the case at hand, Congress had specifically refused to give confiscatory power to the president.

The developments since the terrorist attacks of September 11, 2001, the adoption of the USA PATRIOT Act, and the subsequent wars in Iraq and Afghanistan have prompted a number of Court decisions focusing on the rights of individuals. These included *Hamdi v. Rumsfeld* (2004), granting various rights to a U.S. citizen captured in Afghanistan; *Rasul v. Bush* (2004), allowing foreign nationals held by the United States at its naval base in Guantanamo Bay, Cuba, to seek a hearing; *Hamdan v. Rumsfeld* (2006), ruling that a military commission violated both the Code of Military Justice and the Geneva Conventions; and *Boumediene v. Bush* (2008), allowing a foreign citizen to seek a writ of habeas corpus challenging his captivity in Guantanamo Bay.

Defenders of presidential power over foreign affairs emphasize the unitary nature of the president and his power to act quickly and decisively. Advocates of congressional power focus on its accountability to the people and its power to declare war. Both sides recognize that a democratic republic requires the supremacy of civilian authorities over the military.

CONSTITUTIONAL RIGHTS, PERSONNEL

Constitutional rights stand secure for military personnel, and for the most part, they have “equal protection and due process” under the laws of the United States. For example, the well-known Miranda warning, given by law enforcement to persons being taken into police custody under civilian criminal procedure, which concerns the right to remain silent and the right to counsel, has direct application in military law. Military personnel have protections under Article 31(b) of the Uniform Code of Military Justice (UCMJ) and also under *United States v. Tempia* (1967), which provides the military version of the Miranda rights. The *Tempia* additional warnings extended by Rule 305 of the Military Rules of Evidence allow the right to a military or civilian attorney, or both.

However, military discipline and the UCMJ may affect other legal and constitutional protections. The most obvious UCMJ concern remains the First Amendment’s constitutional right of free speech, and related political ramifications. The Fourth Amendment and the protection against unreasonable searches and seizures is another constitutional concern. This entry describes the rights afforded by the U.S. Constitution to military personnel.

First Amendment Rights

The constitutional conflict between the First Amendment and military status provides one glaring example of the dichotomy between military and civilian legal standards. The balancing act between free speech and Article 88 of the UCMJ can place military personnel in direct conflict with the law. An officer can be held for violation of Article 88, which makes it a violation of military law for a commissioned officer to use contemptuous words against the president, vice president, Congress, and other government officials.

For example, a lieutenant participated in an antiwar demonstration carrying a sign critical of President Lyndon B. Johnson. He was off duty and wearing civilian clothes. Charges under Article 88

followed his participation in the demonstration. The lieutenant's actions were in direct conflict with his role as military officer, demonstrating disloyalty and insubordination to the commander in chief.

This same restraint of free speech would violate the First Amendment's protections if the lieutenant did not hold a commissioned officer status. The appointment under the power of the president of the United States alters a commissioned officer's otherwise civilian right of political free speech. The lieutenant appealed his conviction without success. Challenges to Article 88 of the UCMJ have not succeeded on appeal in the past, nor will they likely prevail in the future.

Religious Freedom and Constitutional Rights

The U.S. chaplaincy is under attack from those who would challenge and dispute its legitimacy under the U.S. Constitution. A scholarly discourse emerged that gave rise to an appellate court case, *Katcoff v. Marsh* (1985). This court upheld the Military Chaplain System as an acceptable support structure for service members. It upheld the First Amendment right of members of the military community to exercise their religious freedom. On the other hand, opponents argue that the chaplaincy violates the government's legal mandate to maintain neutrality in religious matters and the separation of state.

Goldman v. Weinberger (1986) represents a more restrictive ruling. Goldman, an Orthodox Jew and ordained rabbi, served at a base mental health clinic as a U.S. Air Force clinical psychologist. Military regulations prohibited the wearing of a yarmulke or any other headgear inside the building. The only exception to this regulation is for armed security police in the performance of their duties. Goldman was allowed to wear his yarmulke under his hat when in otherwise acceptable locations. However, Goldman was warned that he would face disciplinary action if was caught wearing his yarmulke inside restricted areas.

The Supreme Court upheld the military provision with a 5–4 vote. The Court asserted that deference should be given to the professional judgment of military authorities. These officials are not constitutionally required to abandon their professional judgment. The military is a “specialized society separate from civilian society” and “to accomplish its mission the military must foster instinctive obedience,

unity, commitment, and esprit de corps.” Rather than give priority to their own beliefs, individuals in the military are to subordinate their own desires to the needs of the service. One of the ways the military creates this cohesiveness is by requiring servicemen to maintain uniform visibility. The First Amendment does not require the military to accommodate all religious views, nor does it preclude the uniform regulation.

Fourth Amendment Rights

Another example involves the rights of military personnel to privacy. Military personnel have less expectation of privacy and protection concerning Fourth Amendment rights involving search and seizure. Soldiers living in military barracks have fewer rights and are subject to the unit commander's authority to conduct searches. Soldiers relinquish those rights when they move into the barracks.

The unit commander “owns the barracks” because of government authority and representation. Commander searches must include all soldiers who live in the barracks. The commander must have a dual authority over the person(s) and the location to search and seize contraband or evidence. Searches that target a particular service member require a probable cause. Items seized without the proper authority are invalid and would not be admissible in a trial by court-martial if objected to by defense counsel.

Commander inspections, often referred to as health and welfare inspections, can require military personnel living in barracks to open their wall lockers and footlockers. The commander can delve into personal property lawfully to search and seize contraband or evidence of crimes committed in violation of the UCMJ. Search warrants are not necessary because of the commander's authority to protect military personnel and property.

Once a military member enters a command area, private properties are subject to lawful search and seizure. For example, such government property may include ships, airplanes, and vehicles. A soldier may be transporting drugs or contraband in a suitcase, vehicle, or motorcycle. This soldier is subject to search and seizure because of location, military status, and the probable cause quantum of proof. Only the commander of the military unit has the authority to perform such a search; the delegation of that command power to a junior officer is illegal.

Legal Foundations

The U.S. Congress has established its authority over the military justice system through the power of the “Equal Protection” and “Due Process” clauses of the U.S. Constitution. While not specifically mentioned, this authority flows logically from two constitutional mandates.

Article I, Section 8 states the congressional authority and power “to define penalties for piracy and felonies on the high seas, and for violations of the law of nations, power to declare war, power to raise armies and navies.” Moreover, Article I, Section 8 authorizes Congress with the power to make rules for the government and for regulation of the land and naval forces. Article II, Section 2 describes the president’s authority over the military; the president is the commander in chief.

Legal Appeals

In *United States v. Stuckey* (1981), the Court of Military Appeals, renamed the U.S. Court of Appeals for the Armed Forces, held that the “Bill of Rights applies with full force to the men and women in the military service.” While Congress has the authority to regulate the military forces, the Supreme Court requires that Congress must act in accordance with the U.S. Constitution when it enacts legislation that concerns the armed forces.

The U.S. Court of Appeals has five civilian judges appointed by the president with the advice and consent of the U.S. Senate. The court has worldwide appellate jurisdiction over military personnel on active duty. In addition, it has authority over those individuals who come under the authority of the UCMJ. The court’s appellate legal decisions come under direct appellate review by the U.S. Supreme Court.

The U.S. Court of Appeals for the Armed Forces has a difficult balancing act concerning military readiness of the armed forces and the rights of military personnel under Article I of the Constitution. The court’s role concerns the broad interpretation of federal statutes, executive orders, and departmental regulations. Most important, the court determines the application of constitutional law to service members. These are cherished constitutional and legal rights, not technicalities. They protect the members of the armed forces against arbitrary and capricious acts of the military and government.

Conclusion

Members of the armed forces benefit from many of the same constitutional rights civilian citizens have, with some exceptions for good order and military discipline. Military personnel have the protections afforded by the U.S. Constitution set forth by the founding fathers and stated in the Bill of Rights. Some conflicts concerning the Constitution and military law may affect military personnel; however, consistent with the UCMJ, the judges of the U.S. Court of Appeals for the Armed Forces serve as first-line guardians of the constitutional rights of military personnel. The Supreme Court and the U.S. Constitution serve as the ultimate protectors of those who serve and protect this great nation.

CONTRACTORS, PRIVATE

Scholars and the general public alike associate private contractors with the word *mercenary*, a term that conjures up images of African coups in the 1960s or, to take a longer view, the condottieri that wreaked havoc in Renaissance Italy. While soldiers

of this type certainly existed in many past incarnations, “mercenary” does not do adequate justice to the complex role private contractors played in the history of warfare.

Private contractors have plied their trades as highly organized entities for centuries. The joint stock companies that explored and conquered the New World were not always motley collections of soldiers for hire but impressive conglomerations of military and logistical expertise. Young nation-states lacking the means to defend their sovereignty frequently relied on this expertise by granting contractors the status of legal proxies. Perhaps the best known example is in Article I of the U.S. Constitution, which gave Congress the power to issue “Letters of Marque and Reprisal” in order to hire private contractors, or “privateers,” as they were known at sea.

The advent of the Industrial Revolution proved to be a key turning point in the relationship between the modern state and military contractors. It combined the compelling need for national security with the scientific and productive capacity of capitalism, a relationship Dwight D. Eisenhower later described as the “military-industrial complex.” Today, the private military corporation (PMC) is as much a part of modern warfare as the conventional military. In reality, as proven in Iraq and Afghanistan, the latter cannot function without the private sector’s active participation. This relationship has created new opportunities, but also significant problems in international law and human rights, for modern nations interested in acquiring their services. This entry discusses the development of PMCs, their relationship with the Department of Defense, the role of private military contractors in operations in Iraq and Afghanistan, and the advantages and controversies of outsourcing.

The Rise of the Modern Military Corporation

The contemporary relationship between PMCs and the state can be traced back to the Industrial Revolution and the growing complexity of modern warfare. As weapons systems and logistical support evolved and became increasingly elaborate, nations became more reliant on the private sector. When the United States created a “blue water” (high seas capable) navy in the 1880s, it did so through a well-funded partnership with the steel industry.

Subsequent mobilization efforts in both world wars reinforced the relationship between national governments and corporations. The very scope and scale of 20th-century conflict, incorporating millions of citizens in campaigns that spanned the globe, mandated cooperation between the private and public sectors. Qualitative factors played perhaps an even more important role in forging this alliance. Technological breakthroughs such as radar, synthetic materials, and atomic weapons proved to be decisive advancements and were fostered by heavily subsidized partnerships between the military and its civilian counterparts.

After 1945, the American and Soviet national security establishment invested enormous sums in their respective defense industries. Whole new fields in telecommunications, transportation, and computers, among others, appeared and were developed at the behest of the bipolar struggle for power. The seeming permanence of national security demands hardened the symbiosis between governments and defense corporations.

Ironically, the end of the Cold War extended this relationship even further. P. W. Singer estimates that a vast reservoir of military expertise—as many as 7 million personnel—was demobilized in the decade following the destruction of the Berlin Wall. Many of these individuals found work in companies that provided intelligence collection and analysis, physical security, or military training. In terms of quality, PMCs ran the gamut from loosely run organizations little removed from organized crime to full-scale corporate structures overtly promoted by their host governments.

In the United States, cooperation between PMCs and the defense establishment grew significantly during the Reagan administration. During Reagan’s first term, it was the result of massive defense spending. After 1987, the Defense Department’s relationship with the private sector drew even closer, prompted by budget cuts and a new federal penchant for privatizing government functions for the sake of fiscal responsibility. When the Clinton administration arrived, it championed the same concept. In the 1990s, Vice President Al Gore trumpeted “reinventing government” as a means toward a more streamlined and efficient federal system.

This policy eventually extended to the Pentagon, where officials argued that outsourcing military logistics translated into a more effective “core competency” of waging war. In 2000, various

sources estimated that for every dollar the Defense Department spent, approximately 30% went to “tooth” (or combat capabilities) while 70% went to “tail” (or logistics). The conventional wisdom saw as unnecessary the requirements of maintaining outdated bases or antiquated housing, medical care, and food service.

Consequently, the period saw a rapid increase in the number of corporate personnel employed by the U.S. military. During the Persian Gulf War in 1991, 1 out of every 50 personnel deployed was a private contractor. By the time the U.S. forces were deployed to Bosnia-Herzegovina in the late 1990s, the ratio was 1 in 10. In the new decade, expenditures on military contractors accelerated significantly. Between 1994 and 2002, the historian Deborah Avant estimates, the Defense Department signed some 3,000 contracts worth an estimated \$300 billion.

But what value did private military contractors offer besides additional economy? One key feature was operational flexibility. PMCs were, according to one author, “more innovative, more flexible, and more pragmatic” than conventional military organizations. In practice, individual military corporations did not have to concern themselves with the Pentagon’s labyrinthine command structure or the cumbersome reporting process mandated by civilian lawmakers. This translated into the ability to deploy to global hotspots rapidly if and when a U.S. presence was necessary.

Military contractors also offered U.S. policymakers an attractive exception to federal laws limiting military deployments. The War Powers Act (1973) makes no mention of this type of military force, leaving a useful loophole in existing policy. Contractors recently have allowed the White House to sidestep more specific proscriptions on U.S. assistance abroad. In the late 1990s, when Congress imposed a 400-man limit on American military advisors serving in Colombia, it was initially undone by hiring private corporations to train local military and police units.

Private Contractors and the Global War on Terrorism

Operation Enduring Freedom and Operation Iraqi Freedom both saw a quantum leap in private security firms contracted to provide “boots on the ground.” One of the consequences of General Tommy Franks’s “running start” plan for the invasion of Iraq was the absolute shortage of person-

nel for security duties once major combat operations were over. These involved protecting basic infrastructure—power plants, oil pipelines, and electric power lines—as well as “force protection” of coalition military units and civilians stationed in forward-operating bases and larger facilities. PMCs quickly became responsible for checkpoints, base perimeter security, patrols, and a host of other missions. By some early estimates, civilian contractors became responsible for between 20% and 30% of essential military services in Iraq after 2003. These numbers increased as the war grew in intensity.

Problems came with this perceived utility, however. Operations in Afghanistan and Iraq have highlighted the fact that private contractors are poorly integrated into war planning. Even when their missions overlap, most companies do not coordinate their activities in any comprehensive fashion. The American military assigns contract officers to monitor compliance with individual agreements, but the system breaks down with respect to the hundreds, if not thousands, of separate tasks performed by private firms operating in a war zone. Actual cooperation is left to local initiative.

More important, the United States initially failed to provide clear “rules of engagement” or a consistent policy governing PMCs. In the past decade or more, the absence of a coherent system has produced problems ranging from poor coordination (mentioned above) to instances of blatant illegal activity.

Since the coalition forces invaded Iraq in 2003, the country has become a magnet for private military companies and subsequent controversy. When the scandal involving the abuse of prisoners in Abu Ghraib became public a year after the invasion, contractors working for the Titan Corporation and CACI were quickly implicated for their direct involvement. In May 2005, contractors employed by Zapata Engineering allegedly opened fire on U.S. Marine positions in Fallujah, an act that resulted in their brief arrest and expulsion from the country. Blackwater, a firm that provided bodyguards for both key military and civilian officials, was the cause for numerous complaints and investigations until its final expulsion from Iraq in 2009.

Private Contractors in the Future

Individual countries and the world community have struggled with regulating private contractors.

Unfortunately, the modernized definition of a “mercenary” has produced little legal clarity. In 1989, the United Nations produced the “Convention Against the Recruitment, Use, Financing and Training of Mercenaries” but failed to ratify the measure. In the meantime, many UN documents retain the traditional definition of private contractors as individuals who fight for profit.

U.S. policy proved equally ineffective. For much of Operation Iraqi Freedom, the Coalition Provisional Authority stipulated that contractors fell under American and not Iraqi law. However, there was little agreement regarding legal jurisdiction. The State Department Office of Defense Trade Controls was tasked with monitoring U.S. firms for compliance with law concerning the training of foreign militaries or providing military services. According to the 2000 Military Extraterritorial Jurisdiction Act, the secretary of Defense was responsible for prosecuting violations of law. American policymakers reconciled some of this confusion when Senator Lindsay Graham (R-SC) offered an amendment to a 2007 defense spending bill that placed all civilian and military contractors working for the federal government under the jurisdiction of the Uniform Code of Military Justice. More recently, the United States officially surrendered control of contractors working in Iraq as part of the December 2008 Status of Forces Agreement with Iraq. Under its provisions, contractors providing special protective services for American officials, such as Blackwater, lost the limited immunity previously granted by the U.S. government in exchange for their services.

In early 2013, PMCs were in the process of what one scholar calls “re-regulation.” Some of this activity is voluntary and reflective of a sense within the security industry that self-regulation is useful for the sake of market credibility as well as a useful device to preempt external sanctions. Christopher Spearin in 2001 described the trend as “self-taming of the dog of war for the sake of reputation and repeat clients” (p. 30).

Conclusions

PMCs have repeatedly demonstrated their utility throughout history. They have served as proxies and providers of critical expertise for monarchies and democratic republics alike. This value makes the military contractor a persistent feature of contemporary

war. For much of the current generation of conflict, the premium has shifted from overly expensive weapons systems to armed intervention augmented by intellectual capital, some of which is available for purchase.

While this system is useful, it has limits. A major problem within the private security industry is a function of time. Age has begun to diminish the available pool of current and potential contractors. Men in their prime at the end of the Cold War are now in their 40s and 50s. Simple tasks that were once routine are now subject to the unpredictable physical infirmity that is a reality of middle age. A new stream of combat veterans is replenishing the vast reservoir of talent, but it will never return to its past glory.

A second limiting factor is the law. PMCs today face mushrooming constraints on the use of force. A successively increasing array of national and international laws have caught up with the private security industry in the past decade. Contractors no longer enjoy the discretion that the early stages of the Afghanistan and Iraq Wars created and tolerated. Thus, while the potential for profit remains formidable, the overall scrutiny PMCs now must endure is equally significant and a necessary price for doing the business of war.

COUNTERINSURGENCY

Counterinsurgency is a form of warfare in which a national government, with or without outside assistance, seeks to defeat an armed internal challenge to its legitimacy using a mix of military, paramilitary, political, economic, psychological, and civic means. The objective in counterinsurgency is the civilian population, which the government must reassert control over to defeat the insurgency. This entry examines counterinsurgency as (a) the analytic category best able to explain the most common form of warfare in the early 21st century and (b) the current operational doctrine for U.S. military personnel opposing contemporary insurgent movements. It emphasizes developments that culminated in the December 2006 release of Field Manual 3-24, *Counterinsurgency*, which guided the conduct of the 2007–2008 troop “surge” in Iraq. The shift to an integrated counterinsurgency plan, executed by an enthusiastic practitioner, General David Petraeus, neutralized two simultaneous and distinct Sunni and Shia insurgencies, suppressed sectarian ethnic cleansing, and provided the Government of Iraq an opportunity to pursue a political resolution of the conflict.

Definitions

Counterinsurgency is fundamentally different from conventional maneuver warfare. In maneuver warfare, the militaries of sovereign nation-states exploit high-technology weapons systems (tanks, self-propelled artillery, and attack helicopters) to achieve strategic war aims through decisive battle-field victories. The quintessential maneuver war was World War II, and the quintessential maneuver battle took place near the Russian city of Kursk in July–August 1943, in which a combined total of slightly more than 1 million German and Soviet soldiers and airmen became casualties. The terrain on

which maneuver warfare unfolds is precisely the surface of the earth on which the armies collide. The intensity of maneuver warfare and the violence it visits on military personnel and civilian populations are limited by international agreements rooted in the just war doctrines of late Medieval Europe. In counterinsurgency, a sovereign state, which may or may not be assisted by another power or powers, confronts a threat within its territory mounted by elements of its own population, perhaps sponsored by another hostile nation or nations (in that case, a “proxy” conflict). Insurgents can be motivated by numerous factors, including one or more of the following: ethnic nationalism, ideology, religion, or culturally unacceptable levels of income centralization and corruption. It is possible that the process of globalization has become sufficiently disruptive of traditional cultures as to regularly produce insurgent movements motivated by a combination of nostalgia for a traditional past and a demand for social justice beyond that available through classical liberalism and capitalist market relations. Both insurgents and counterinsurgents employ a range of military, paramilitary, political, economic, civic, psychological, and cultural means to achieve their aims. The terrain of both insurgency and counterinsurgency is the human population the insurgents seek to dominate and the counterinsurgents seek to secure from insurgent subversion and control. The concepts of insurgency and counterinsurgency have largely replaced the older, less precise categories of “guerrilla warfare” and “unconventional warfare,” which are no longer used in doctrinal publications. In many struggles, the violence generated by insurgents can appear to outsiders to be totally indiscriminate, while counterinsurgent forces historically chafe against the limits on counterviolence inherited from maneuver warfare. However, success in counterinsurgency usually accrues to the more patient opponent best able to practice an economy of violence during a protracted struggle.

Basic Principles of Counterinsurgency

The following principles of counterinsurgency have been derived primarily from the lessons learned by the British in Malaya, the French in Algeria, and the United States in South Vietnam. They appear in a slightly different form and order in FM 3-24. In the context of both Iraq and Afghanistan, the phrase

“the government” includes both the governing institutions of the host nation against whom the insurgency is targeted and the Western counterinsurgent forces occupying the targeted nation and supporting the client regime to achieve the larger strategic objectives of the United States and the North Atlantic Treaty Organization alliance.

1. Counterinsurgencies must be *protracted efforts*; populations being protected from insurgent coercion must be confident of the government’s long-term commitment to their physical defense and their future social and economic well-being.
2. Defense or reestablishment of *governmental legitimacy* is the primary task in counterinsurgency; all elements of national power must be directed toward that objective.
3. No insurgency can be defeated without a political solution to the popular grievances from which it draws its strength; *political factors are paramount*; military tasks are secondary.
4. Insurgents must be isolated from the larger population and their cause delegitimized; this means that the government must establish population security under the *rule of law*.
5. Unity of effort is essential among all military-civil organizations and all echelons of military command—everyone, from the theater commander to the soldier searching a house, must “get it.”
6. Counterinsurgents must understand all aspects of the human and cultural environment in which they will operate.
7. Military counterinsurgency missions must only be executed on the basis of timely, specific, and reliable intelligence.

In addition to the above basic principles, FM 3-24 identifies a number of “imperatives” or touchstones to guide the individual behavior and decision making of counterinsurgent soldiers. Soldiers must manage the flow of information and control expectations for short-term success, always use the minimum level of force, learn from experience and adapt operations to changing circumstances, reward initiative by decentralizing decision-making authority to the lowest possible command echelon in contact with insurgents and the local population, and take

every opportunity to strengthen the military and civil institutions and personnel of the host nation.

Conspicuously missing from the above principles and imperatives is any emphasis on the central concept of maneuver warfare: the “decision.” Decisive victories that “reset” the struggle’s political calculus are uncommon in counterinsurgency. Very long insurgencies are the rule, and the party that can best exploit protraction generally achieves success through the exhaustion of its opponent. Either the insurgency collapses from a gradual loss of popular support and a stubborn refusal of the government to overreact (e.g., the Philippine Hukbalahap Rebellion) or the government decides that, notwithstanding the operational and tactical success it has achieved, the insurgency has placed it in a strategic position where liquidation of the struggle on the insurgency’s terms is less costly than its indefinite continuation (e.g., French Indo-China, Algeria, Vietnam).

Insurgency Versus Terrorism

No firm theoretical distinction is possible between insurgency and terrorism. Insurgents frequently target noncombatants and civil employees of the government, and counterinsurgents frequently overrespond with acts of counterterror, which violate internationally sanctioned laws of state-directed armed conflict and only serve to legitimize the insurgency. However, terrorists and insurgents, while equally ruthless, have different primary objectives: The terrorist’s goal is committing future terrorist acts with regional or global political impact, while the insurgent is a member of an organization (however decentralized) seeking to destroy an existing government’s control over all or a portion of that nation’s sovereign territory. Terrorist organizations can be so decentralized as to be virtually franchise operations without central direction, whereas insurgent groups are usually hierarchically organized in a cellular structure. To survive, both terrorists and insurgents must become highly observant of their opponents, adaptive, and quick to exploit short-window vulnerabilities left open by the government under attack. Terrorists and insurgents may cooperate when their immediate goals are congruent, as did al Qaeda and the disaffected Sunni sheiks in Iraq’s Anbar Governorate during 2004–2006, or they may be split apart through adept political initiatives, as occurred during the “Anbar Awakening” movement of 2007–2008.

Historical Applicability of the Concept of Counterinsurgency

Although the term was not in general use before the mid-1960s, *counterinsurgency* is a category of considerable historical and geographical elasticity. Thus, it has been applied to colonial efforts to suppress ethnic or national liberation movements at the turn of the 19th–20th centuries (Cuba, South Africa, and the Philippines); the Nicaraguan Intervention of 1925–1932; German and Japanese efforts to suppress partisan movements in France, Italy, Greece, Yugoslavia, Russia, the Philippines, and Burma during World War II; post-1945 decolonization struggles (French, British, Dutch, and Portuguese); various Latin American civil wars (Venezuela, Guatemala, Columbia, and El Salvador); and armed postindependence separatist movements in developing nations (Philippine Hukbalahap Rebellion, Oman, Sri Lanka, and Western Morocco). It also informs academic examinations of the unsuccessful French and American efforts against the Vietnamese “people’s war” before 1975. After 2001, analysts mined a broad range of struggles, including those in Greece (1944–1949), Algeria (1946–1962), Malaya (1948–1960), and Chechnya (1994–1996, 1999–2009), to distill “lessons learned” and “best practices” for U.S. and North Atlantic Treaty Organization application in Iraq, Afghanistan, and elsewhere. These studies resulted in the distillation of the two main senses in which the term *counterinsurgency* is now used by soldiers, academics, security intellectuals, and journalists: (1) to describe historical efforts, both successful and unsuccessful, to defeat insurgencies of various strengths in various geographical regions and (2) as doctrinal guidance for the execution of military-civil efforts to defeat contemporary insurgencies.

U.S. Doctrinal Development, 1975–2006

Efforts to revise counterinsurgency doctrine in the U.S. military began with a number of reports of the Vietnam War written by serving or retired military officers during the 1980s, typified by Andrew F. Krepinevich’s *The Army and Vietnam* (1986). Krepinevich argued that the United States failed in its central aim to defend an independent, noncommunist South Vietnam because it failed to understand the nature of the North Vietnamese “people’s war,” a sophisticated variant of Maoist Revolutionary

Warfare, in which communist military forces progressively increased their technological sophistication as the United States disengaged. This failure of analysis and adaptability prevented the United States from adopting an overall strategy balancing population security and regional development with reforms to the Republic of Vietnam’s government and military, while imposing rigorous controls on indirect fire and tactical air power during military operations to avoid alienating the civilian population.

After Vietnam, the U.S. Army’s senior leaders directed their energies toward reestablishing a traditional “warrior ethos” within the post-1973 all-volunteer force and developing a new “AirLand Battle” maneuver warfare doctrine to enable U.S. and North Atlantic Treaty Organization forces to defeat a Soviet invasion of Western Europe short of the Rhine River without resorting to the use of theater nuclear weapons. Counterinsurgency, while understood as a category of warfare expected to continue in the less developed world, seemed a thing of the past for an American military shielded by a broad domestic political consensus supporting the “Weinberger Doctrine,” which raised barriers to U.S. military participation in wars not defending a “critical national interest.” The counterinsurgency and insurgency struggles the United States opposed or sponsored between 1975 and 2000 (Soviet-Afghan War, 1979–1988; Salvadoran Civil War, 1979–1991; Nicaraguan “Contra War,” 1980–1990) were undertaken by paramilitary elements of the Central Intelligence Agency and the military’s Special Operations community; the success of the AirLand Battle doctrine during the Gulf War of 1990–1991 justified the defense establishment’s focus on maneuver warfare. Neither the failed humanitarian intervention in Somalia (1993–1994) nor the successful stability operations in Bosnia and Kosovo (1996 to date) became protracted counterinsurgencies.

As the 21st century dawned, the incoming secretary of defense, Donald Rumsfeld, could announce his intention to “transform” the nation’s ground combat forces via exploitation of emerging forms of “information warfare” and “smart weapons” to allow quick-in, quick-out interventions as occurred in Afghanistan in 2001–2002. The invasion of Iraq in 2003 seemed to be a replay of 1991, with a quick collapse of Iraq’s conventional maneuver forces. The neoconservatives directing U.S. foreign policy in the Bush administration had earlier dismissed

the possibility of significant Iraqi resistance to what was assumed to be a brief occupation. Because U.S. forces were to be redeployed out of Iraq quickly, after a rapid handover of sovereignty to returned expatriates, the United States would have no need for counterinsurgency expertise.

Two separate insurgencies, however, developed in Iraq during 2003–2005. The first was a Sunni–al Qaeda alliance, focused on killing coalition soldiers and civilian reconstruction workers via improvised explosive devices, controlling the “Sunni Triangle” immediately north and west of Baghdad, and destabilizing the U.S. occupation through sectarian assassinations and attacks on Shia religious sites. The second was an armed Shia movement, whose aims were to control Shia majority districts inside Baghdad and Basra, infiltrate Iraqi government security forces, counterattack against Sunni violence through ethnic cleansing of mixed neighborhoods, and, in the long run, transform Iraq into an Islamic republic. These conditions quickly exposed the U.S. Army’s institutional inability to combat insurgencies. Battalion and brigade commanders, trained in the era of AirLand Battle, naturally gravitated toward kinetic or insurgent-centric actions (cordon operations, raids, and airstrikes), which failed to defeat Sunni resistance, contain Shia-Sunni sectarian violence, or build the military or civil capacities of the Shia-dominated Government of Iraq.

In mid-2006, as events in Iraq seemed to be spiraling entirely out of control, General David Petraeus, commander of the army’s Combined Arms Center at Fort Leavenworth, who had largely pacified the northern Iraqi city of Mosul in 2004 as commander of the 101st Airborne Division, assembled a cadre of junior field grade officers with advanced academic degrees and previous Iraq deployments to create a doctrine for counterinsurgency operations and illuminate the way forward in Iraq. Petraeus’s soldier-scholars resurrected the classic texts of the French counterinsurgency effort in Algeria: David Galula’s *Counterinsurgency Warfare: Theory and Practice* (1964) and Roger Trinquier’s *Modern Warfare* (also 1964). Both were reprinted in 2006, and Galula’s text in particular was issued to officers preparing to deploy to Iraq (Trinquier’s was not widely distributed because of his explicit defense of the use of torture to roll up insurgent cells—an unpalatable tactic after the 2004 Abu Ghraib scandal). Galula’s and Trinquier’s emphasis on intelligence and the primacy

of political over military factors in counterinsurgency infused the revision of the army’s official counterinsurgency doctrine, aided by lessons learned from British initiatives during the Malayan Emergency, as summarized in Sir Robert Thompson’s *Defeating Communist Insurgency* (1966) and reemphasized more recently in Lieutenant Colonel John Nagl’s *Learning to Eat Soup With a Knife* (2002).

On December 15, 2006, shortly before President Bush’s “surge speech” of January 10, 2007, the Department of the Army and Marine Corps Combat Development Command published FM 3-24/Marine Corps Warfighting Publication 3-33.5, *Counterinsurgency*. Subsequently, General Petraeus was selected to command Multinational Force–Iraq as the executor of the surge strategy. He was thus in the enviable position of having personally overseen the creation of the operational doctrine and tactical synthesis he would employ to “turn the corner” in Iraq by late spring of 2008. Subsequently, David Kilcullen, an Australian counterinsurgency advisor to General Petraeus, explored the applicability of the Iraqi surge to the ongoing campaign in Afghanistan in *The Accidental Guerrilla* (2009).

Conclusion

Recently, several theorists have advanced new conceptual frameworks subordinating counterinsurgency to what they argue are permanent shifts in the essential nature of warfare. Among these are General Sir Rupert Smith’s “wars among the people” and Colonel Thomas X. Hammes’s “fourth generation warfare.” Smith voices profound doubts as to whether military force can possess *any* utility in an accelerating age of wars not among Westphalian nation-states but among “peoples,” wars that will metastasize irrespective of national borders and national counterinsurgency efforts. Hammes argues for an emerging paradigm of warfare based on “networks,” not “forces,” in which a nation’s most vulnerable point will always be the political will of its decision-making elite. In addition, the term *asymmetric warfare*, which originated in a 1975 article by Andrew J. R. Mack, has recently been rediscovered and expanded to address the question “Why do big nations lose small wars?” Most of these lost wars were counterinsurgencies, and the big nation in question is the United States. While the best of these works offer useful explorations that may prove to

have identified permanent historical developments, none of them can match FM 3-24 as a concrete guide to action. Nor do they advance “metrics” generally valid for the measurement of progress in counterinsurgency that can be cross-culturally adapted to specific environments.

While FM 3-24 documents a renaissance in the understanding and execution of counterinsurgency efforts at the operational and tactical levels, it cannot provide strategic direction to the military; that is the sole prerogative of the executive branch of the U.S. government. Nor can the military change the domestic political calculus within the United States, which imposes grave limitations on the ability of the nation to mobilize itself for both current and future counterinsurgency efforts. The Foreign Service, historically the proponent of American “soft power” (diplomacy, aid programs, and cultural exchanges, rather than armed force), has lost most of its “in-country” capabilities, forcing soldiers to carry an unexpected burden of reconstruction in Iraq and Afghanistan. The national security and intelligence bureaucracies continue to “stovepipe” their data and their analyses in the search for more access to the president and resources from Congress. The critical analytic distinction between the capabilities and intentions of hostile nations has largely been eliminated, with the result that Americans are increasingly unable to distinguish between foreign policy problems and existential threats. In addition, the triumph of acquisitive individualism in the United States since the 1970s has eroded the cohesion essential for a protracted global struggle: Presidents can wage war only so long as personal and corporate taxes remain low. The national will thus remains fragile, and the American public continues to reject significant sacrifices, financial or otherwise, placing severe limits on the human and material resources that can be devoted to any given counterinsurgency effort. In short, we have yet to learn whether the United States can exploit protraction as well as its opponents. And while baseline tactics, techniques, and procedures for successful counterinsurgency efforts are now in place, Americans have yet to forge a consensus on a new set of tests to replace the now obsolete Weinberger Doctrine, which would allow them to judge when an insurgency in the developing world threatens the critical interests of the United States.

COUNTERINTELLIGENCE

Counterintelligence (CI) is one of the most crucial yet unknown military activities in the contemporary world. There are no set standards for CI activities; in fact, CI admits of multiple strategies and tactics. CI has become a very important issue, particularly in the post-9/11 era, to protect troops, information, operations, facilities, and U.S. interests. This entry discusses the history of CI in the United States, the types of military CI operations, and the skills required by military CI specialists.

Definition

CI is defined as any activity related to collecting, understanding, organizing, or responding to intelligence threats from other countries or criminal organizations, such as terrorist groups, to avoid

sensitive and classified information falling into enemies' hands. As such, CI has both defensive and offensive aspects. Specifically, CI activities focus on spies, sabotage, attacks, and military activities carried out by countries, terrorist groups, or enemy organizations against military, intelligence, or other security targets. In a general sense, CI's ultimate goal is to neutralize enemy intelligence actions and to protect national and military information and procedures from espionage. The military bears the primary responsibility for CI activities in its jurisdiction, including bases and foreign units, while the police and other civilian agencies act outside the military's jurisdiction. Since the early 20th century, executive power, civilian agencies, and the military have based their decisions related to security issues on CI data, to cancel or counteract enemy actions during both peace and war.

History

In the 20th century, CI became a central activity of U.S. military and intelligence agencies due to the great interest foreign countries and illegal organizations had in accessing crucial security information, including data about security architecture in military zones, weapons technologies, the organization of military units, and so on. To avoid information escaping due to the work of spies and double agents, between the two World Wars selected military personnel were trained to detect infiltration activities in the United States and overseas. During the Second World War, CI functions were divided between the Federal Bureau of Investigation, which acted in the United States and in the Western Hemisphere, and the U.S. Army and Navy special corps, which held responsibility in their own jurisdictions, including bases and foreign territories such as the Panama Canal Zone and Guam. This situation implied a lack of coordination between diverse CI corps, a fact that directly affected CI effectiveness.

After the end of World War II, and responding to this debate, all intelligence and CI services were subordinated to the Central Intelligence Agency. In this way, the military was restricted to act only within the boundaries of its bases and during military operations. This situation frustrated the military during the Cold War, because military jurisdiction was subordinated to other agencies. Despite this fact, during the Cold War, the military did act at home to search

for dangerous foreign activities, a situation that interfered with civilian intelligence and CI agencies.

In the post-Cold War era, and particularly during the recent Global War on Terrorism, the military has gained significant autonomy to carry out CI measures to protect military bases and to detect terrorist groups' activities in the United States and military areas including Iraq and Afghanistan. This situation emerged after the passage of the USA PATRIOT Act (2001), which granted wide license to the military to capture suspected terrorists and to perform CI activities outside the United States.

Agencies in Charge of Military CI

The Department of Defense holds responsibility for coordinating intelligence and CI activities in all military branches, including activities in the Global War on Terrorism. Within the Department of Defense, a specialized CI office coordinates CI activities between military branches; this office, however, has no common standard or doctrine for CI activities applicable to all services. Fundamentally, this office is primarily responsible for budget coordination, in spite of the efforts of groups like the Office of the National Counterintelligence Executive (2001) and U.S. National Counterintelligence Strategy (2005) to establish basic norms across different agencies and corps. Currently, military branches design their own programs and initiatives to carry out CI missions. Army CI activities belong to its Criminal Investigation Division; the navy (which includes the Marine Corps) has the Naval Investigation Service, which combines law enforcement functions with CI; the U.S. Air Force has the Office of Special Investigations, with responsibility over CI activities in its jurisdiction. Military branches deploy operational CI services in garrisons and overseas according to the threats affecting their institutions and operations. Some experts argue that this lack of coordination has become problematic and limits the overall effectiveness of U.S. CI operations.

Characteristics

CI represents a cornerstone of military activities, with the ultimate goal of providing commanders sufficient information to preserve secrecy and to protect their troops from enemy intelligence activities and deny the enemy data that could be used to

attack friendly forces. There are at least four basic priorities for military CI:

1. *Investigation*: to prove or disapprove signs of espionage or other activities related to attacks on friendly interests, the assassination of leaders or commanders, sabotage, or attacks against military or naval units—organized by foreign countries or criminal or terrorist organizations
2. *Operations*: conducted to neutralize, disrupt, manipulate, and eliminate the possibility of the enemy manipulating friendly troops or military intelligence services, including recruiting personnel and conducting espionage or counterespionage activities
3. *Collection*: all activities related to collecting data about threats for the military or civilian agencies
4. *Analysis and prediction*: assimilating, evaluating, and interpreting information about sensitive areas of CI and producing a well-structured report on different threats to troops and the country

Types of Military CI Operations

There are at least three basic kinds of military CI operations, which have much in common with the activities of other intelligence agencies. Military CI activities, however, have limited jurisdiction, and agents must receive governmental orders to act outside military bases. Penetration is the most basic type of CI operation, consisting of recruiting an intelligence source to provide information about foreign military forces. The second type of operation focuses on double-agent activities. The main characteristic of this operation is to infiltrate an agent who appears to serve the enemy but actually is controlled by the home military, with the ultimate goal of providing information about criminal or foreign threats. The third type of operation is the most glamorous: counterespionage. Differing from movie-based stereotypes, these activities necessitate a long process to detect spies within bases or troops. Usually, these operations involve multiple activities to discover and uncover enemy agents.

Intelligence and CI

Intelligence and CI services are quite similar in spite of conceptual differences and differing methods. Both activities use human intelligence, technological

approaches, and other methods to form the first line of defense for military institutions and the country. Their common goal is to provide a multidisciplinary approach to denying information to unauthorized persons or organizations. For these reasons, military intelligence and CI teams work together, sharing data and sources with the goal of preventing information from falling into the hands of the enemy. For instance, during surveillance activities, an intelligence service might detect a double agent; this information could be vital to CI experts to uncover efforts at sabotage or terrorist activities within military units. Likewise, CI specialists could find crucial data relating to intelligence concerns, such as plans to assassinate a leader.

Basic Skills for Military CI Specialists

Military personnel involved in CI missions and activities must possess particular skills to maximize their performance in the field, including war zones, military bases, and undercover missions in other areas. The Office of the National Counterintelligence Executive prepared the “Fundamental Elements of the Counterintelligence Discipline” (2006), which could be applied to any U.S. civil or military organization tasked with CI operations as follows:

1. Knowledge of the structure and procedures of national CI missions for both military and civil agencies
2. Wide knowledge of foreign intelligence organizations and terrorist groups’ culture and methods of action
3. Advanced knowledge about CI terminology, investigation, operations, and handling of sensitive information extracted from interviews and clandestine sources
4. A sixth sense to validate collected data
5. Surveillance and countersurveillance skills
6. Communication skills to collect information and to report it appropriately
7. An advanced disposition to work in interagency operations
8. Critical thinking, interpersonal skills, and a broad knowledge about languages and foreign costumes
9. Expertise to handle technology and the information extracted using it

10. The ability to work in a high-pressure environment at home and overseas

To summarize, a soldier tasked with CI operations must be a multifaceted individual who combines these skills and abilities with the maturity to assume a low profile and eschew public recognition in spite of the importance of his or her missions.

CI and the Global War on Terrorism

After the September 11, 2001, attacks on the United States, changes were made to U.S. security measures to provide the nation with the best protection possible from foreign threats. Specifically, the military made greater use of preventive intelligence services and focused more intensely on preventing the escape of data from military and civil intelligence services. These changes were codified in the Counterintelligence Enhancement Act of 2002, designed specifically to respond to the challenges posed by hostile states and terrorist and criminal organizations. As a result of this act, the Office of the National Counterintelligence Executive assumed functions to coordinate efforts in these matters, including the activities of each CI corps in the different military branches. In spite of this new level of coordination, however, each service maintains autonomy to carry out CI activities in the Global War on Terrorism, particularly in foreign activities and in operations in Afghanistan and Iraq.

COURAGE

The *Oxford English Dictionary*, third edition, defines *courage* as “the heart as the seat of feeling, thought, etc.; spirit, mind, disposition, nature.” While the definition of the word *courage* has changed throughout history, the soldier’s experience in battle often revolves around or relates to the particular intrinsic feeling described by this definition. However, as soldiers’ experience changed over the past few decades in American history, the concept of courage changed as well. Military tactics evolved to protect soldiers as much as possible, so that courage no longer has to be exemplified by the traditional depiction of a 19th-century soldier waving a regimental banner in front of his brigade as he is hit with enfilade fire. In addition, the opposite of courage, cowardice, is something that no soldier would admit to during the War of Independence or the Civil War, for fear of others calling his manhood into question. In modern military practices, however, recognition of fear and the subsequent onset of courage is a common discourse among soldiers who share the commonality of battle experience. Courage is a feeling that propagates an action that is deemed as brave. Thus, the courage displayed by soldiers can be applied to the discussion of modern military strategy, tactics, and experience. This entry discusses views on the concept of courage throughout history and describes medals and awards bestowed in the United States to recognize acts of courage.

The History of Courage

Throughout U.S. history, men and women who served in conflicts overseas and at home, whether in victory or defeat, displayed the utmost examples of courage through their acts of bravery and honor.

While one usually imagines courageous acts as that of a commander leading his troops over a trench or a private soldier rallying his unit around the flag, the majority of soldiers call on courage to withstand the fear of battle on a daily basis. How did soldiers have the courage to do such actions? First, one must look at the broader culture of society to understand how a particular generation views the concept of courage. Soldier motivation can be closely tied to why men and women risk their lives on the battlefield. Studies of the common soldier correlate the degree to which a soldier believes in a “cause,” also known as ideology, to how strong his dedication is to follow orders in spite of fear. Second, many soldiers fought to display their manliness or manhood, which was a significant virtue in 19th-century society. If soldiers went to war to define their manhood, the solidification of this attribute is through committing courageous acts, just as the opposite reaction would be to retreat or desert. Finally, the leadership understands that while courage is necessary, asking soldiers to serve as cannon fodder demoralizes them, and they have thus modernized the tactics to keep up with the technology. Because early tactics did not allow for soldiers to take cover or reload under the protection of defenses, soldiers were forced to shed fear and doubt by pursuing the enemy. Since modern technology outweighed the tactics, the officers made adaptations to decrease the number of casualties and protect their soldiers by digging trenches and building fortifications, which was once viewed as cowardly. Therefore, the concept of courage is modified throughout a war based on the soldier’s lived experience and ability to withstand the imminent fear of death.

Because of the many occasions and contexts in which courage is used, it is often difficult to determine one singular definition of the concept. However, because warfare and courageous acts span time and geographical space, several defining threads appear consistently. Embedded within the American military tradition are the classical views of courage from Ancient Greece and Rome. Tactics within early American armies coincided with the Greek method of warfare and subsequent expressions of valor. When on the offensive, Spartans characterized their method by steady, organized, and disciplined tactics. Early American military strategies, including the 19th-century Napoleonic-style tactics of the Civil War, required the infantry to march across open fields, often uphill, to be met with direct fire from

enemy rifles and artillery. These soldiers displayed courage by obeying their orders, remaining in their ranks, and avoiding the temptation to retreat. On the other hand, Athenians were known for their phalanx style of fighting, where individual charges led the offensive attack. This classical style allowed for soldiers to meet their opponent face to face and demonstrate their skill, strength, and courage. These intimate, individual tests of valor rooted in classical warfare became visible in Western military engagements, particularly in hand-to-hand combat. Native Americans, particularly the Plains Indians, embraced this phalanx style because they viewed courage as the virtue necessary to avoid the ultimate shame, failure. Therefore, by the end of the 19th century, American military strategists combined the traditional aspect of unit effectiveness with individualism reminiscent of the phalanx style. At the turn of the 20th century, young men grew up hearing stories of their grandfather’s experience as a soldier. Often, each generation wanted its war, as a chance to prove its courage just as its fathers and grandfathers did. The Spanish-American War and the two World Wars brought about a new characterization of what courage meant and how it was displayed. Several elements of courage remained the same, such as the intense surge in adrenaline when asked to face an enemy and the expectation that a soldier should never show fear. However, the tactics and technology in 20th-century warfare were adapted to prevent high casualty rates and to avoid asking the common soldier to overcome unthinkable odds. For example, in World War I, commanders ordered their soldiers to remain in trenches for protection, but then they were ordered to charge “over the top” and advance across an open field only to be mowed down with machine gun fire. Again, one imagines the courageous private running faster and farther, only to be met with death before reaching the enemy trench. This image supports the expectation that the only outcome for one who displays courage is death. However, these individual acts of courage help inspire others to perform similar acts, almost like a domino effect. Lord Moran, a medical officer in World War I, argues that wars are won by the courage and endurance of the few, which others—both soldiers and civilians—cling to for hope. Thus, the fear of death, pain, and defeat succumbs to an inner emotion that rises above the doubt and in turn evokes a common inertia.

While tactics changed during World War II through the establishment of mobile protection in the form of tanks, commanders still expected soldiers to withstand deadly assignments where they were openly fired on. In the Pacific theater, American soldiers experienced a different kind of enemy, particularly with Japanese kamikaze pilots. In Japan, the samurai legacy of victory at all cost resonated during the Meiji Restoration, in the Imperial Military and among the fighter pilots who flew one-way missions. The Japanese tradition of death before dishonor caused American soldiers to redefine their own conception of courage and make accommodations to withstand a seemingly resilient enemy. Japanese tactics made the battlefield more dangerous for Americans and took a higher toll on soldier morale and casualty rates. Uncommon courage was common in those who accepted the orders of their commander and carried out their duty. A historian of World War II argues that battles are won by individual efforts, collectively amassed. The war exposed soldiers to fatigue, disillusionment, death, and isolation; but despite all of these obstacles, it raised courageous acts.

With the fear of nuclear war and the rise of guerilla warfare in the second half of the 20th century, the military transformed its understanding of courage to meet modern expectations of the combat soldier. In the jungles of Vietnam, soldiers encountered a new condition of fear—that of the unknown enemy. American soldiers in Vietnam faced terrorism, guerrilla attacks, and saboteurs from the Viet Cong. These soldiers described courage as the constant necessity to survive daily routine and always be on the defensive. In addition, to withstand the unfavorable weather, terrain, and conditions, many soldiers had to summon the courage to sustain them through the harsh realities of warfare.

At the turn of the 21st century, American soldiers redefined courage as they faced an enemy enriched in Islamic religious and cultural radicalism. During the wars in Iraq and Afghanistan, soldiers were constantly under threat from improvised explosive devices (IEDs), explosives, extremism, and surprise attacks by civilian soldiers. While Westerners perceived courage as risking one's life in combat, some Islamic soldiers believed that the utmost exemplification of honor was to give up one's life in combat. The line between combat soldier and civilian as well as between the battlefield and the home front

has become blurred. Soldiers are faced not with the sense that the enemy could be coming but rather that the enemy is all around. In addition, soldiers need to summon the courage to not kill civilians indiscriminately and seek to identify friend from foe. Therefore, hunkering down behind a defensive fortification is no longer viewed as cowardice but as a method for withstanding nonconventional enemy attacks.

Regardless of the era, there are several core components inherent in the concept of courage. Some of these timeless notions are what soldiers who exhibit courage feel; others are how society and the military reward courageous acts. Beginning with courage as a feeling, soldiers who recall instances where they performed or witnessed courageous acts claim that it is something only a combat veteran could understand. Scholars of military history argue that when soldiers return to society, they have a hard time relating their experiences to loved ones and the general population, who were not exposed to such traumatic circumstances. In addition, soldiers who try to describe a battle and what drove them to display such valor and sacrifice often cannot translate their experience into understandable terms for the public. *Courage is not a brilliant dash or an instantaneous entity but something deep within a soldier.* Thus, courage is exemplified along with other inherent emotions, such as hope, morale, and disillusionment, to name a few, because it marks the moment when a soldier's consciousness overlooks dangerous consequences and lets the mind and body take over.

Measuring Courage

There are a number of medals and awards granted for those who exhibit the highest degree of courage. The highest honor for any U.S. soldier is the Congressional Medal of Honor. Congress created this award first for the navy in 1861 and then the army in 1862. During the Civil War, a total of 1,520 individuals received the Medal of Honor. In 1896, President William McKinley restricted the award of the medals to only those who exhibited gallantry and intrepidity above and beyond what was shown by one's fellow soldiers. Throughout the 20th century, the Medal of Honor honored members of the U.S. Army, Navy, Marines, Air Force, and Coast Guard in all conflicts through the present day. During World War II, Army Captain Maurice Britt, despite being

wounded, led his unit in a counterattack against a German force in Italy. This Medal of Honor recipient's undaunted courage and prowess in arms were largely responsible for repulsing a German counterattack that, if successful, would have isolated his battalion and destroyed his company. Navy SEAL Michael Thornton received the Medal of Honor during the Vietnam War when he returned through fire to rescue his commanding officer, also a Medal of Honor recipient—Lieutenant Tommy Morris. In the 1990s, Presidents George H. W. Bush and Bill Clinton awarded Medals of Honor to Japanese Americans and African Americans who previously had been unrecognized because of racism and discrimination. Recently, in the War in Afghanistan, U.S. Army Private Ross McGinnis was operating a machine gun when a grenade was thrown in proximity to his unit. Private McGinnis's courage saved the life of at least four of his comrades, and his family was given the Medal of Honor he earned.

Apart from the Medal of Honor, the second highest award for courage is the Distinguished Service Cross, and the third highest is the Silver Star, both established in 1918. The Purple Heart, established by George Washington during the War of Independence, was originally named the "Badge of Merit" and was awarded to those who demonstrated an exceptional level of courage. The Purple Heart was a patch of purple fabric that served as the predecessor to the Medal of Honor and now serves as an award for soldiers who are injured or mortally wounded in combat. Also, each branch of the U.S. military established its own specific awards for valor and courage in combat.

However, as both soldiers and scholars alike have argued, everyday acts of courage go unnoticed, and soldiers call on the courage within them to carry out orders that may be seen in the eyes of others as expectations. The concept of courage has varying degrees based on the individual. For example, one soldier may view his ability to recover from a wound as courageous, while another may explain his rationale for leaving his family as courageous. Because courage is used and experienced in a variety of ways, it is an ambiguous concept that cannot be solely measured through awards and decoration. Arguably, soldiers utilize inner courage to reenter society, especially after being severely wounded. Because combat stress and its repercussions on the soldier's psyche trigger mental illnesses such as posttraumatic

stress disorder, soldiers have a struggle beyond the battlefield. In the same vein, wounded soldiers use prosthetics not only to function in modern society but even to return to combat. As military tactics and technology advance in the future, the concept of courage and how combat soldiers demonstrate valor and sacrifice will change. Ultimately, the tradition of courage within the U.S. military will continue to be a widely studied and ambiguous concept that only those who experience combat can articulate and communicate to the population they fought to preserve.

COURT-MARTIAL

The court-martial is a military trial. Under the authority of the Uniform Code of Military Justice (UCMJ), members of the U.S. armed forces share many of the same legal rights as civilians. They have (a) the right to remain silent, (b) the right not to make self-incriminating statements, and (c) the right to legal counsel. Military appellate courts review cases under their jurisdiction, unless the accused waives the right

to appeal. The exception to the waiver concerns death penalty cases.

Military court-martial is a judicial system for trying law violators and UCMJ violations. The military court system or court-martial is similar to a civilian trial. Court-martial military offenses have direct applications from the punitive articles of the UCMJ under the authority of Title 10 U.S. Code §877. This entry discusses two prominent cases of court-martial in the United States, the three levels of court-martial, jurisdiction, and civilian review.

Background

Specific landmark cases have a historical value for examining the mistakes of the past. The court-martial of Private Eddie Slovik, who abandoned his unit in France during World War II, serves as an excellent example of disparity in military punishment. Toward the end of the war in 1944, Slovik faced a firing squad after a court-martial and was executed in January 1945 at the age of 24. He was the only member of the armed forces who would succumb to the death penalty by firing squad since the Civil War.

Colonel Billy Mitchell, a famous officer in the Army Air Corps, stood trial for openly criticizing his superiors several years after World War I. Mitchell's

court-martial denounced statements concerning his superiors' failure to develop air power and anticipate future events. Mitchell resigned from the Army Air Corps after conviction and suspension from active duty for 5 years without pay. World War II and future events would eventually prove his candid observations and assumptions correct concerning the need for a rapid air power deployment.

As the years passed, additional justice issues emerged from other incidents similar to those cases cited above. The military justice system under the so-called Articles of War was typically arbitrary and inconsistent. Under the present system, the two cases mentioned may have received improved adjudication and justice. The reform moment emerged from Article I, Section 8 of the U.S. Constitution, and the power of the Congress. The new military justice system that took effect in 1951 offered many protections permissible in the civilian justice system.

Court-Martial Hierarchy

There are three basic types of courts-martial: (1) summary court-martial, (2) special court-martial, and (3) general court-martial. Article 15 provides the means for commanders to administer nonjudicial punishments for minor offenses, and avoid

Table I The Three Levels of Courts-Martial

<i>Summary Court-Martial</i>	<i>Special Court-Martial</i>	<i>General Court-Martial</i>
Charges of minor incidents of misconduct	Intermediate court level	Most serious level of the military court system
Requires consent of the accused	Military judge and three military officer panel court or jury members	Military judge and at least five court members
Depending on the service branch, judge and advocate/attorney	Trial counsel (prosecutor) and defense counsel	Trial counsel (prosecutor) and defense counsel
Maximum punishment is less than in a special court-martial	Enlisted personnel can have one-third enlisted members	Accused may request at least one-third enlisted members
Forfeiture of two-thirds pay for 1 month	Limited to 12 months of confinement	<i>Manual for Courts-Martial</i> may require confinement
Confinement for 30 days	Forfeiture of two-thirds pay for 12 months	Dishonorable or bad-conduct discharge or dismissal
Hard labor without confinement for 45 days	Officers cannot be dismissed from service or confined	The death penalty for certain offenses

court-martial. Refer to Table 1 for the three levels of courts-martial.

The military court-martial system makes every effort to maximize the constitutional rights of armed forces members. Since World War II, the court-martial tendency has moved in the direction of enhanced “due process.” The three different levels of court-martial authority represent increasing levels of legal protections and potential punishments based on the severity of the offense.

Summary Court-Martial

The summary court-martial consists of one commissioned officer who may not be a lawyer. Moreover, the accused must consent to this level of court-martial and is normally not entitled to legal representation. The accused has the right to cross-examine witnesses, however, which is a vital opportunity to disprove the charges. The accused service member has the right to call witnesses and produce his or her own evidence during the court-martial.

This level of court-martial can adjudicate minor offenses committed by enlisted members of the armed forces. Punishment consists of a maximum of 30 days’ confinement or hard labor without confinement for 45 days. In addition, forfeiture of two-thirds pay per month for 1 month and reduction to the lowest military pay grade (E-1), which affects the amount of salary until the member achieves the same grade again.

Military enlisted members above the grade of E-4 who are legal noncommissioned officers have a different legal status. They cannot be subjected to confinement or to hard labor without confinement, and the adjudication process can only reduce noncommissioned officers to the next lowest pay grade.

Special Court-Martial

This level of court-martial is at the intermediate level of adjudication and punishment. Generally, a military judge participates at this level. The special court-martial requires (a) a trial counsel prosecutor, (b) a defense counsel, and (c) a minimum of three officers who sit as panel members. This court panel is similar to a jury member panel.

Enlisted personnel may request a court composed of at least one-third enlisted personnel to approximate that of a trial by peers. Furthermore, an officer

or enlisted military member may request a trial by judge, not unlike civilian courts. In addition, the accused may request a civilian lawyer at government expense.

A special court-martial has specific limitations regardless of the type of military offense. The sentencing structure permits (a) no more than 1 year of confinement, (b) hard labor without confinement for 3 months, or (c) a lesser amount of punishment if the charges require limitations. The forfeiture of pay is permissible: two thirds of basic pay per month for 1 year and a bad-conduct discharge.

At this level, there is a separate standard for commissioned officers. The adjudication process will not allow dismissal from service or confinement. These two options cannot be part of the sentencing process. However, enlisted personnel can receive a bad-conduct discharge or lesser punishments. The special court-martial can impose any penalty under the Rules for Court-Martial except dishonorable discharge, dismissal, and the death penalty.

General Court-Martial

This level of court-martial is the highest level of adjudication and punishment and requires a thorough Article 32 investigation. This preliminary Article 32 investigation is similar to the civilian preliminary hearing. The Convening Authority requests the Article 32 investigation in accordance with Rule 405 for the Rules for Court-Martial.

At this level, the military judge emerges. The general court-martial requires a trial counsel prosecutor, a defense counsel, and a minimum of 5 officers sitting as panel court members, similar to jury members. The exception to the number of court members occurs in the death penalty cases, which require 12 panel members. Furthermore, enlisted personnel may request a court composed of at least one-third enlisted personnel.

An officer or enlisted member can request a judge and waive the panel, with the exception of death penalty cases. Refer to the *Manual for Courts-Martial* for specific-offense punishments. The punishments are the harshest for general court-martial, for example, dishonorable discharge, dismissal for officers, long periods of confinement, and the death penalty. At this level of court-martial, the most serious cases find the proper adjudication or exoneration of the charges.

Generally, a two-thirds majority vote is required for conviction; however, a unanimous verdict is required for death penalty cases. Cruel and unusual punishments are not within the purview of the court-martial. Therefore, flogging, branding, and tattooing the body or other unusual punishments are not within the penalty provisions of court-martial.

General Jurisdiction

The court-martial authority has jurisdiction over members of the armed forces, rather than the federal or state locality of a specific place or location. The jurisdiction over service members is worldwide and does not depend on where the offense was committed. The status of the accused is directly connected to membership in the armed forces. Serving on active duty establishes military jurisdiction. The court-martial applies to either regular active duty or reserve components serving on active duty. Moreover, even retired members of the regular components of the armed forces entitled to pay are subject to the UCMJ and court-martial under certain circumstances.

Joint Jurisdiction

Military service members are subject to court-martial under the authority of UCMJ offenses for U.S. Code violations. In some cases, U.S. Code violations may also violate federal, state, and local laws or a combination therein. The dilemma presented by multiple jurisdictions requires coordination, liaison activities, and agreements as to which jurisdiction will prosecute. The staff judge advocate (the chief military lawyer) will coordinate with the appropriate civilian authorities. This liaison activity may occur among the U.S. Attorney's Office, the State Attorney General's Office, or the local District Attorney's Office.

Although an accused military member may be subjected to court-martial, that does not preclude prosecution at the state or local level. In addition to subjecting military members to prosecution under legal jurisdiction of the UCMJ, court-martial procedures for the same offense in a federal court is unconstitutional. Double trials for the same UCMJ and federal offense would constitute double jeopardy clause violations under the Constitution and be in violation of the Fifth Amendment.

There are exceptions to the double jeopardy clause concerning criminal prosecution in state and

local courts. The Fifth Amendment clause does not apply because state and local governments are mutually exclusive jurisdictions or different sovereigns. Furthermore, in multiple-jurisdiction cases, the accused can face court-martial and state or local prosecution for the offense. Agreements by both sovereign jurisdictions normally prevail in the spirit of the double jeopardy clause.

Generally, the problems of jurisdiction are more complex when legal violations emerge overseas in foreign nations. Foreign nations have jurisdiction to detain, arrest, and prosecute for violations of their laws. These laws prevail, unless waived within their nation's borders, for visiting military.

The exception arises when a foreign nation grants to the visiting military force, expressly or by implied consent, relinquishment of jurisdiction. Status of forces agreements with host nations determine which nation will have jurisdiction over particular offenses. The United States seeks status of forces agreements that maximize the jurisdiction of UCMJ and court-martial authority over military personnel overseas.

Military Appellate System

The appellate system has three levels of jurisdiction, similar to the federal court system: (1) the Court of Military Review, (2) the Court of Military Appeals, and (3) the U.S. Court of Appeals for the Armed Forces. Each level has an increasing level of formality. At the first two levels, there is a greater military presence. Civilian judges dominate at the highest level.

Court of Military Review

Under the authority of Article 66 of the UCMJ, each judge advocate general establishes a Court of Military Review. The panels are composed of not less than three appellate judges for reviewing court-martial cases. Members of the court may serve as commissioned officers, or they may be civilians, each of whom must be an attorney and a member of the bar of a federal court or the highest state court. The appellate government counsel conscientiously pursues and prosecutes the appeal under this section.

Court of Military Appeals

Appeals from the Court of Military Review are available under UCMJ Article 67. This prescribed

regulation allows certain appeals to the Court of Military Appeals. The Court of Military Appeals reviews all cases affirmed by the Court of Military Review that involve the death penalty. In addition, the Court of Military Review can review all cases when the accused can demonstrate “good cause.” Moreover, members of the armed forces can request a review of a decision by the Court of Military Review within 60 days or earlier.

U.S. Court of Appeals for the Armed Forces

The accused may petition the U.S. Court of Appeals for the Armed Forces; it has international appellate jurisdiction. The court consists of five civilian judges appointed by the president with the advice and consent of the Senate. This level of appeal considers a wide range of legal issues from the two lower level courts. Moreover, these legal considerations include constitutional law, criminal law, legal evidence, and criminal procedure. Furthermore, their jurisdiction includes administrative law and national security legal issues.

Civilian Review

Legal decisions that stem from the U.S. Court of Appeals for the Armed Forces are subject to direct review by the U.S. Supreme Court. Military convictions are subject to Supreme Court appellate review, as well as civilian cases and capital punishment convictions. According to UCMJ 867a, Article 67a, decisions of the U.S. Court of Military Appeals are subject to review by the Supreme Court by writ of certiorari, under Section 1259 of Title 28 of the U.S. Code. The U.S. Court of Appeals for the Armed Forces has an automatic review of capital punishment cases. Another important protection is that military capital punishment executions require the specific authorization of the president.

Conclusion

The presumption of innocence exists for the accused. Guilt beyond a reasonable doubt is the burden of proof. The UCMJ and the related court-martial system is among the best systems of justice; however, as with any justice system, it is not perfect. Nevertheless, it remains a superior justice system for members of the armed forces.

COVERT ACTIONS, MILITARY

Covert action, in the language of U.S. intelligence, is an “activity or activities of the United States Government to influence political, economic, or military conditions abroad, where it is intended that the role of the United States Government will not be apparent or acknowledged publicly” (50 U.S.C. §413b(e), 2006). Covert action is an activity to influence the behavior and support of a foreign government and may involve anything from persuasion, such as the spread of information or financial influence, to paramilitary action. Even though covert action is not the same as gathering intelligence, these operations most often take place within an intelligence organization due to the secrecy involved. The term *covert action* is also sometimes used to describe any intelligence activity or a military action that takes place secretly until completed. This entry discusses the history of covert actions and provides information on the 2011 assault in Pakistan against Osama bin Laden.

Early History

As early as the American Revolution, George Washington realized that espionage and covert action were crucial in winning the fight against a more powerful British army. Therefore, after Washington was elected president, the Contingent Fund for Foreign Intercourse, also known as the

Secret Service Fund, was established by the U.S. Congress to give the president the ability to carry out secret operations without notifying the legislative branch. He was not required to inform Congress of how the money was spent but only that the funds had been utilized.

Approximately 100 years later, during Woodrow Wilson's term as president (1913–1921), a philosophy took hold known as Wilsonian internationalism, which focused on the importance of making the world a safer and better place. The United States began to take a more active role in world affairs and in advancing the tenet of democracy. The question became "What means will we take to do so?"

During the years leading up to World War II, intelligence activities were usually carried out by those working with foreign policy in the State Department, the Office of Naval Intelligence, or the War Department's Military Intelligence Division. During the early years of his presidency, Franklin D. Roosevelt tried for greater cooperation between the various intelligence groups, and in 1941, he appointed William J. Donovan as the coordinator of information. Donovan's charge was to lead this new civilian office and bring organization to the gathering of intelligence by the various entities. The office would (a) correlate and analyze these data, (b) make the data available to the president and other government officials approved by the president, and (c) simplify the process for obtaining information necessary for national security.

In June 1942, under the leadership of Roosevelt, the first organized intelligence service was created. Donovan was again called on to lead this new Office of Strategic Services, predecessor to the Central Intelligence Agency (CIA). Covert action was a major component of its mission. The White House and military leaders directed the Office of Strategic Services as it successfully completed secret missions against the Nazis and the Japanese to bring about victory in the end.

After the war, Office of Strategic Services operations were transferred to the War and State Departments. However, President Harry S. Truman saw a need for a postwar central intelligence organization and signed into law the National Security Act of 1947 (61 Stat. 495) establishing the CIA. A few months later, he signed a presidential directive approving a secret propaganda program within the

CIA, believing that without it Soviet covert actions could overpower U.S. foreign policy goals.

One of Truman's first undertakings was to influence the elections to be held in Italy in 1948. Through the CIA, the United States poured millions of dollars into presidential campaigns in Italy to ensure the success of the anticommunist political parties. His 1947 presidential directive also led to the CIA's covert funding of Radio Free Europe and Radio Liberty during the 1950s through 1971.

In 1960, the U.S. Security Council established the 5412 Committee to provide the White House with approval of sensitive covert operations. They began a program of covert action against Fidel Castro and his regime in Cuba. The objective was to replace Castro's regime with one more aligned with the interests of the Cuban people and more acceptable to the United States. This program set in motion the Bay of Pigs Invasion in April 1961.

To prepare for this invasion, the United States trained a small army of Cuban exiles in Guatemala for the invasion of Cuba. However, even with the U.S. government's efforts to keep the invasion classified, word spread. Due to intelligence leaks and disagreements on the strategies and tactical errors, such as older planes that missed bombing targets, this anti-Castro regime operation failed.

The Post–Cold War Era

In 1989, the Cold War ended. The Berlin Wall came down, and communist governments in Eastern Europe were dismantled. However, the CIA already had operations under way in various Third World countries, and these undertakings to spread democracy persisted.

In the early 1990s, Special Operation Forces multiplied, and the United States became a leading force of influence in other countries. Many of these forces were used for broad purposes, such as aiding foreign governments in their fight against drug trafficking, teaching counterinsurgency techniques, and sharing U.S. military expertise.

At the end of the Persian Gulf War (1991), Iraq was still considered a grave danger to the world, and Saddam Hussein remained in power, with President George H. W. Bush comparing him to Hitler. Scientists in Iraq openly vowed to resume building nuclear weapons, and Bush authorized covert efforts to weaken and undermine Saddam.

President Bill Clinton continued Bush's efforts but in a scaled-back manner. Legislative leadership was concerned that the funds paid to some groups to help topple Saddam included too much money for too little results. Therefore, they cut in half the budget to fund such operations. There is little known about the exact nature of these operations due to the classification of such information. However, it was reported that the program had financed opposition groups inside and outside Iraq, broadcast propaganda on several radio stations, distributed leaflets, and spearheaded a disinformation campaign inside the country.

The Global War on Terrorism

With the attacks of September 11, 2001, a plot masterminded by Osama bin Laden, America's security outlook began to concentrate more on global terrorism, al Qaeda, bin Laden, and other nonstate actors. Overcoming such terrorism meant dealing more with insurgents and those advancing their agendas through irregular (or unconventional) warfare. Again, Special Operation Forces expanded, with Iraq and Saddam Hussein remaining major concerns.

A few days after the attacks, Congress passed the Authorization for Use of Military Force Act (115 Stat. 224), which gave President George W. Bush powers to combat terrorism around the world. In the hope of finding bin Laden, the U.S. military invaded Afghanistan approximately 1 month after the attacks. The troops depended on CIA operatives to help them establish links to the Northern Alliance Fighters, a group that since 1996 had been fighting the Taliban. The Taliban, an Islamist militant and political organization, was supported by bin Laden and al Qaeda. The Bush administration began drone strikes in Afghanistan and continued the same in Iraq for what were called "targeted killings" in this Global War on Terrorism.

After taking office in 2008, President Barack Obama continued the drone strikes, and in 2009, a Predator drone shot two Hellfire missiles, killing Baitullah Mehsud, the commander of the Pakistani Taliban. The drone was operated by someone at the CIA headquarters in Langley, Virginia, hitting Mehsud's father-in-law's house and killing more than 10 people, including Mehsud's wife.

Mehsud was considered an enemy of the United States, but it was not the U.S. military that killed

him but the CIA. They dropped a missile on a house in Pakistan, a country that was not at war with the United States. Though a controversial act, counterterrorism experts believe that fewer people were killed by these missiles than would have been the case if they had dropped a conventional bomb or had pursued a ground assault.

The United States lost track of bin Laden in 2007, but in the summer of 2010, thanks to Pakistani operatives, the CIA located the man they believed to be the only courier between bin Laden and al Qaeda. After identifying him and watching him for several weeks, they tracked him as he drove to a well-protected compound in Abbottabad, Pakistan. Then came orders to develop an intelligence, surveillance, and reconnaissance "soak," meaning that tremendous focus, manpower, and monetary funding were made available for this particular mission to explore the possibilities that the tall man pacing around the compound, seen from drone cameras and satellites, was truly bin Laden.

Bin Laden was given the code name Geronimo for this operation. A playbook was developed with a series of hypothetical scenarios that could take place if there was a military effort to capture or kill bin Laden. As evidence increased indicating that bin Laden was in fact living in this compound, the playbook grew larger.

A small classified group consisting of less than 25 people was discussing the plans to take out bin Laden. This group considered a Predator drone attack but was afraid that it would not be powerful enough to guarantee the death of bin Laden. They also talked of pulling in Pakistani operatives but were suspicious that some of them may have known where bin Laden had been living for the past few years. Eventually, they decided to go with a helicopter assault.

There would be 79 operatives, including Navy SEALs, intelligence specialists, medical corpsmen, and translators, and one bomb-sniffing dog.

The helicopter assault occurred during the early morning hours of May 1, 2011, Eastern Daylight Time (May 2, Pakistani time). Obama and his war council waited in the White House Situation Room, following the mission real time through video feed. Bin Laden and four others were killed, but none of the U.S. team was fatally injured. The phone call came to Obama stating, "Geronimo EKIA," meaning "Geronimo, enemy killed in action."

Not only did the United States kill this leader of global terrorism, it also collected a magnitude of intelligence, including flash drives, phone numbers, computer files, DVDs, and handwritten documents. This 2011 helicopter assault in Pakistan was a major victory for the U.S. military and intelligence communities. The year 2011 brought multiple drone successes, for example, when they were used to protect the protesters in Libya, who were rising up and demonstrating in their streets for a more favorable government. The United States remotely flew unmanned aircraft as part of a North Atlantic Treaty Organization–led air campaign to protect Libyan civilians. Initially, drones with cameras flew over Libya for surveillance. Then, on April 23, drones with missiles were utilized, with the first strike taking out a multiple rocket launcher near Misrata that had previously been used against the rebels by the Muammar Qaddafi regime.

In September, U.S. drones over Yemen killed Anwar al-Awlaki, a U.S. citizen living in that country. Awlaki was declared an enemy who incited terrorist actions against the United States. However, this strike was controversial due to the fact that Awlaki was an American-born citizen and had never been formally charged with a crime. Questions continued into 2012 as to the legality of this attack.

U.S. attorney general Eric Holder Jr. said that the United States has the right to kill American citizens abroad if they are senior al Qaeda leaders, if they pose an immediate terrorist threat, and if chances of them being captured are unlikely. However, not all U.S. citizens agreed, believing that targeting American citizens away from the battlefield without judicial review went against constitutional principles.

However, the killing of bin Laden in May 2011 affirmed the success of such covert actions and how the secret use of drones and cameras helped in gathering information without putting American forces in danger. Nevertheless, there is still concern that when drones are used to drop bombs, they more easily miss targets and innocents are killed. There is also concern about the secrecy surrounding covert action. A democracy is expected to have an open and transparent government, but covert actions depend on just the opposite for success.

Voters, Congress, and allied governments do not like being left out of the information trail. Yet there is unique flexibility and efficiency for those in charge

if they do not have to explain their every plan and action to the public. Secrecy also means less chance of retaliation. Some congressional committees, such as the Senate Select Committee on Intelligence, have limited oversight for covert activities. However, there is ongoing debate as to whether these committees are all that is needed.

CRIMES, MILITARY

Article I, Section 8, states that Congress has the power “to make Rules for the Government and Regulation of the land and naval Forces.” In accordance with this provision, Congress has established regulations for the military as embodied in the Uniform Code of Military Justice (UCMJ), which constitutes the body of criminal laws governing the behavior of armed services personnel in the United States. These laws are implemented by means of the *Manual for Courts-Martial*, which is issued by the president of the United States in his role as the commander in chief of the military. Other sources that inform criminal liability in the military include the Military Rules of Evidence, regulations issued by the Department of Defense (DOD), regulations of the various service branches, court decisions, and local regulations that are expressly punitive in nature and issued by a flag officer (general or admiral).

Military crimes are offenses for which a person can be held criminally responsible under military law. While some military crimes are similar to civilian crimes, there are many crimes that are exclusive to the military justice system. This entry first examines

the jurisdiction requirements for prosecution under the UCMJ and reviews the types of crimes identified in the UCMJ. It then discusses some demographic data related to military crime and concludes with a look at the military's efforts to apprehend offenders and to prevent crime.

Jurisdiction

To try a case under the UCMJ, a military court must have jurisdiction over an individual and the offense. Article 2 of the UCMJ (Section 802 of Title 10, U.S. Code) lists 12 categories of individuals that are subject to trial by court-martial: military personnel, whether active, reserve, or retired; members of certain quasi-military organizations (e.g., Public Health Service members when serving with the armed forces); military prisoners; prisoners of war; and, under very limited circumstances, certain specified categories of civilians. Those who serve in the military are subject to the UCMJ regardless of their location throughout the world. Nonmilitary DOD employees and contractors are subject to the UCMJ under some circumstances when overseas.

Crime Under the UCMJ

Military crimes in the UCMJ are described in Articles 77 through 134. A crime can be a felony or misdemeanor. *Manual for Courts-Martial* regulations prescribe elements and punishments for each crime. Every element of the offenses listed must be proven beyond a reasonable doubt for the accused to be found guilty.

Scope of Criminal Liability

Suspects can be guilty as a principal or accessory after the fact. The accused can also be guilty of an offense and the lesser included offense.

Crimes That Parallel Those in Civilian Society

There are multiple military crimes that are similar to those found in civilian society. These crimes can be divided into alcohol and drug-related offenses, homicide offenses, offenses against a person, sex offenses, property offenses, financial offenses, offenses against the justice administration, and speech offenses.

Alcohol and drug-related offenses include drunken or reckless operation of a vehicle, aircraft, or vessel

and wrongful use or possession of controlled substances.

Homicide offenses run the gamut from premeditated murder, unpremeditated murder, murder while doing an inherently dangerous act, felony murder, manslaughter, voluntary manslaughter, involuntary manslaughter resulting from culpable negligence, death or injury of an unborn child, and negligent homicide.

Offenses against persons involve stalking, maiming, simple or aggravated assault, and kidnapping.

With respect to *sex offenses*, the UCMJ criminalizes rape, aggravated sexual assault, aggravated sexual contact, abusive sexual contact, child sex abuse offenses, indecent acts, forcible pandering, wrongful sexual contact, indecent exposure, and sodomy.

Property offenses include damaging nonmilitary property, larceny, wrongful appropriation, robbery, arson, burglary, housebreaking, receiving stolen property, and unlawful entry.

There are also a host of *financial offenses* that occur when a military person's debts are not paid.

Offenses against the justice administration include perjury, frauds against the United States, resisting arrest, escape, issuing a false official statement, and obstructing justice.

Speech offenses include provoking words or gestures, extortion, threats or hoaxes designed or intended to cause panic or public fear, and communicating a threat.

Crimes Unique to the Military Service

There are also crimes that are exclusive to the military. These include enlistment offenses, absence offenses, superior-subordinate relationship offenses, duties and orders offenses, combat-related offenses, and property offenses.

For *enlistment offenses*, the UCMJ criminalizes fraudulent or unlawful enlistment, appointment, or separation.

Absence offenses include desertion; missing movement, which criminalizes failing to be present when one's unit, aircraft, or ship leaves; and absence without leave. Absence without leave is also known in popular culture as "AWOL."

Superior commissioned, noncommissioned, and warrant officers have increased protection under the UCMJ in the execution of their office. *Offenses within the superior-subordinate relationship* include disrespect toward superior commissioned officers; assaulting or willfully disobeying a superior commissioned officer, which carries a maximum penalty of death during war; and insubordinate conduct toward a warrant officer, noncommissioned officer, or petty officer. A superior officer's misconduct can divest him or her of this protected status, however. In addition, officers can commit crimes if they exhibit contempt toward public officials currently in office. Exceptions for private comments exist.

Duties and orders offenses criminalize failure to obey an order or regulation, cruelty toward those who are subject to one's orders, getting drunk on duty, dueling, malingering by feigning or causing harm to oneself to avoid duty, straggling, and misbehavior of a sentinel. Failure to suppress mutiny or sedition in the accused's presence or to report mutiny or sedition that the accused has reason to know about is also a crime.

War can be an aggravating factor that triggers additional crimes or increases the severity of the punishment. The UCMJ criminalizes *combat-related offenses* such as misbehavior in front of the enemy, a subordinate compelling surrender, improper use of the countersign, forcing a safeguard, aiding the enemy, misconduct as a prisoner, and espionage. Retaining captured or abandoned property, frequently termed "war trophies," is also a military crime. The offense of spying applies to everyone, including U.S. citizens and non-U.S. citizens, and carries a mandatory sentence of death.

The UCMJ criminalizes *property offenses* such as loss, damage, destruction, or wrongful disposition of military property and makes waste, spoilage, or destruction of nonmilitary U.S. government property illegal.

Other unique military crimes are Conduct Unbecoming an Officer and Gentleman and violations of General Article 134. Conduct Unbecoming an Officer and Gentleman criminalizes conduct that disgraces the person as an officer. It applies to male and female commissioned officers, cadets, and midshipmen and can be used in conjunction with other

charges. General Article 134 is typically used only if the conduct is not encompassed by one of the enumerated articles in the UCMJ. The three types of criminal offenses under General Article 134 are (1) conduct prejudicial to good order and discipline, (2) conduct of a nature to bring discredit on the armed forces, and (3) noncapital offenses criminalized by federal laws that are not enumerated in the UCMJ.

Inchoate Offenses

Inchoate offenses are those that occur in preparation for or furtherance of another military crime under the UCMJ. These offenses are separate crimes from those that they furthered and include conspiracy, solicitation, and attempts to commit a crime when the further crime was not fully carried out but the intention to carry it out was present.

Defenses

Several of the crimes have available defenses. Procedural defenses that are typically accompanied by a motion to dismiss are lack of jurisdiction, statute of limitations, former jeopardy, pardon, and denial of speedy trial. Affirmative defenses, which admit that the act was committed but deny that it was criminal, include lack of mental responsibility, mistake of fact, obedience to lawful orders, self-defense, defense of another, accident, entrapment, duress, inability, intoxication, defective causation or intervening cause, justification or excuse, and voluntary abandonment. Mistake of law is usually not a viable defense. Finally, available defenses that deny that the accused committed the criminal act are mistaken identity, alibi, good character, and impossibility.

Military Crime From a Sociological Perspective

Military Crime Rate

In FY (fiscal year) 2011, crime increased in the U.S. Army from 2010 but was still less than in 2007, 2008, and 2009. Violent felonies made up 4% of the crimes, nonviolent felonies 36% of the crimes, and misdemeanors 60% of the crimes. Violent sex crimes constituted 47% of violent felonies in the U.S. Army.

Military Crime Rate Versus Civilian Crime Rate

Trends from 2006 to 2009 indicate that the crimes of aggravated assault, murder and nonnegligent manslaughter, and robbery were greater across

the U.S. civilian population than among active U.S. Army soldiers. However, forcible rape in the U.S. Army was more than double that in the U.S. civilian population in 2009.

Offenders and Victims

Junior soldiers committed 68% of all crimes and constitute 43% of the U.S. Army. Noncommissioned officers committed 22% of the crimes and constitute 28% of the U.S. Army. Interestingly, 90% of the crimes in FY 2011 were committed by 71% of active-duty soldiers.

From 2006 to 2011, the rate of victims and offenders of violent crimes in the U.S. Army increased, but there were more victims than offenders, indicating that individual offenders were harming more victims in violent crimes than in the past years. In the U.S. Army's reports on violent felonies, more victims were civilians than soldiers, and female victims outnumbered male victims by more than 2 to 1.

The rate of rape in the U.S. Army is continuing its distressing pattern of increasing yearly, with an increase in sex crimes in the U.S. Army of more than 28% from 2006 to 2011. Women constitute 95% of the victims of sex crimes. Common factors in sex crimes include alcohol and high density housing. The offenders were frequently acquaintances of the victims. Victims were more at risk between 6 months and 2 years after enlistment, during transition periods, when 18–22 years of age, and during off-duty time periods, such as weekends and holidays.

The rate of domestic violence and child abuse has increased since 2001.

Role of the Criminal Justice System in Apprehending Criminals and Preventing Crimes

Apprehending Criminals

Multiple steps are involved in apprehending those suspected of committing military crimes. The resolution of military crimes through the military judicial process is detailed in the *Manual for Courts-Martial*, which includes the Rules for Courts-Martial, the Military Rules of Evidence, Punitive Articles, and Nonjudicial Punishment Procedure (better known in the military as Article 15 discipline).

Authorized persons can apprehend suspects when there are reasonable grounds to believe that a person subject to the UCMJ committed or is in the process of

committing an offense. *Apprehending* means taking the suspect into custody and is the military equivalent of “arrest” in civilian society. Additionally, anyone can report an offense to any military authority. That authority will generally send the report to the accused's immediate commander. The charging and convening authority has the power to determine charges, dismiss the charges, or forward the charges to another commander. The accused's immediate commanding officer will notify the accused of the charges against him or her and who ordered the charges.

The military justice system has multiple judicial alternatives for resolving military crimes. Three alternatives are administrative discipline, nonjudicial punishment (NJP), and court-martial.

Under administrative discipline, commanding officers can mete out nonpunitive, administrative discipline for minor offenses under the UCMJ. The purpose of administrative discipline is to correct poor behavior rather than punish the individual. NJP punishment is carried out pursuant to Article 15 of the UCMJ. Commanding officers can immediately mete out punishment for crimes under the UCMJ that are greater than those justifying administrative discipline but not so severe as to warrant a court-martial. The purpose of NJP is corrective and to enable the commanding officer to immediately punish the offender to maintain discipline.

Courts-martial are disciplinary. The three levels of court-martial are differentiated by the level of command that can invoke the proceeding, the available punishments, due process, and appellate review. As the available maximum punishments increase, so do the level of command that can convene the court-martial, the required due process, and the available appellate review. Military enforcement officers and commissioned, warrant, petty, and noncommissioned officers have the authority to apprehend a suspect subject to court-martial.

The lowest level of court-martial, which is limited to enlisted personnel for nonserious offenses, is the summary court-martial. Offenses go to special court-martial when they are greater than those warranted for summary court-martial but not as great as those that require general court-martial. Any noncapital offense under the UCMJ and any military person can be tried in special court-martial.

General courts-martial are for the most egregious of offenses and permit the highest level of punishment, including death. An investigation must be

conducted before any charges are referred to general court-martial. Anyone subject to the UCMJ can be tried for any offense under the UCMJ in general court-martial.

Under the military judicial system, the hierarchy of review extends from the Court of Criminal Appeals to the U.S. Court of Appeals for the Armed Forces and the U.S. Supreme Court. Specific requirements must be met for the case to be reviewed at each level.

Courts-martials, summary courts-martial, and Article 15s have decreased since 2006, but separations for misconduct have increased since 2006.

Crime Prevention

The military has also attempted to prevent military crimes through a variety of measures, including attempting to correct bad behavior through administrative discipline and NJP, publicizing punishments to deter future crimes, criminalizing not stopping certain crimes from being committed in the person's presence and not reporting knowledge of certain future crimes, and implementing enhanced reporting measures. Many military bases also have crime prevention websites to report suspicious activities as well as offer advice on how to avoid victimization.

The military has also focused on preventing domestic and sexual violence. To reduce domestic violence, the DOD formed the Defense Task Force on Domestic Violence, which made several recommendations. The military branches also have family advocacy programs that help prevent domestic abuse. To reduce sexual violence, the DOD created the Defense Task Force on Sexual Assault in the Military Services and maintains a Sexual Assault Prevention and Response Office. Each military branch has a program to help further prevent sexual assaults.

CRIMES, WAR

War crimes have been a part of customary law for centuries and more recently were codified by treaties and conventions. The United States codified international law rules of land warfare during the Civil War and published the results. In 1907, an international conference drew up the Hague Convention on Land Warfare, detailing existing customary laws of war and defining war crimes. After the bloody events of World War II and the war crimes trials in Nuremburg and Tokyo, states again collaborated, penning the Geneva Conventions of the Laws of War. This entry examines the roles of customary law, the Geneva Conventions, and the International Criminal Court and includes examples of specific war crimes.

War Crimes Defined

Before war crimes were described in detail by the Geneva Conventions, states were guided by customary law. Customary law derives from a standard and

consistent practice among most states and binds all states, even those that are not parties to treaties that define the same principles. A state may object to some customary law, but it generally cannot opt out of customary international law once the norm becomes a fundamental principle of international law.

War crimes were defined in the 1949 Geneva Conventions to include (a) willful killing, (b) willfully causing great suffering or serious injury to body or health, (c) torture or inhuman treatment, (d) extensive destruction or appropriation of property not justified by military necessity, (e) compelling a prisoner of war or civilian to serve in the military of the hostile power, (f) unlawful deportation or transfer of civilians, (g) willfully depriving a prisoner of war or civilian of the right to a fair trial, (h) unlawful confinement of a protected civilian, and (i) taking of hostages.

Further amendments from the Additional Protocol I, passed in 1977, developed new protections during international conflicts. The most serious crimes, called grave breaches, include (a) medical experimentation, (b) delaying repatriation of prisoners of war, (c) attacking civilians or undefended localities, (d) using the Red Cross emblem in a fraudulent manner, and (e) attacking historic monuments. Under the Geneva Conventions and Additional Protocol I, countries must prosecute those accused of grave breaches or turn them over to a state willing to prosecute. Grave breaches apply only to international armed conflicts and only to protected persons. Protected persons include wounded and sick combatants, prisoners of war, and civilians.

The process to form the first International Criminal Court (ICC) began in 1998 with overwhelming international support. In 2002, the ICC treaty entered into force, and as of December 2011, 120 states are party to the court. The law of the court was designed to work with existing national legal systems and may exercise jurisdiction only when national courts are unwilling or unable to prosecute crimes. Crimes included within the jurisdiction of the court are war crimes, genocide, crimes against humanity, and crimes of aggression, and they may not apply retroactively.

Rules pertaining to internal conflicts are far fewer because most states already have laws that regulate domestic matters. Additional Protocol II, also written in 1977, details rules for civil wars. The Statute of the International Criminal Tribunals

in Yugoslavia and Rwanda included crimes of violence to life or health, summary executions, pillage, collective punishment, and hostage taking. The Statute of the ICC further lists war crimes for internal conflicts. Some of the worst atrocities committed during the century are not considered war crimes, however. Although genocide and crimes against humanity are international crimes, they are usually defined separately from war crimes. Crimes against humanity are acts of violence or other inhuman treatment committed against civilians, generally perpetrated against civilians in one's own country, while genocide is the deliberate and systematic elimination of a certain group of people.

Terrorism also further complicates issues relating to war crimes. Both customary law and the Geneva Conventions fail to encapsulate individual actors (or groups) committing atrocities against civilians. Where terrorist activity is part of an international or civil conflict, the actions could be considered violations of other laws or customs, but most states do not consider it a war crime.

Specific Conflicts

Vietnam

One of the most infamous incidents of war crimes committed by U.S. servicemen during the Vietnam War occurred at My Lai. In 1968, Charlie Company moved through My Lai, killing every person and animal in the area. Hundreds of civilians, mostly women, children, and the elderly, were rounded up and executed; almost two dozen women and young girls were reportedly raped. Although one soldier reported the incident to his superior and a chaplain, no thorough investigation was done.

One soldier's letters to a congressman and other government officials exposed the truth, and Lieutenant General William Peers was directed to open an official investigation into the event. Although the Peers Commission recommended that more than 20 officers be charged with the events that transpired at My Lai, only a few were formally charged. Lieutenant William Calley was the only soldier brought to trial and convicted; he was given a life sentence on 22 counts of premeditated murder of civilians. His defense was that he was following orders. My Lai was not the only incident of murder during Vietnam, however. A Pentagon task force found numerous war crimes during the Vietnam War that were substantiated by

army investigators, and more than 200 individuals were recommended for formal charges, not including the My Lai participants. Only 57 were actually court-martialed and 23 convicted, however.

Yugoslavia

A series of deadly wars in the former Yugoslavia led to some of the worst war crimes committed since World War II. In the 1990s, fighting driven by ethnic conflicts led to several new independent states, but not before atrocities had been committed by all sides during the war. In 1993, the United Nations established the International Criminal Tribunal for the former Yugoslavia (ICTY) to investigate and punish those who committed war crimes. The ICTY was the first war crimes tribunal since the Nuremburg and Tokyo tribunals.

The ICTY made major achievements in the area of international humanitarian law, focusing on individualizing guilt so that soldiers and politicians were held accountable for their actions. Victims could testify against the accused; the ICTY has collected an impressive historical record of the atrocities. The majority of cases the ICTY has heard have been of Serbs and Bosnian Serbs, but convictions have also been secured for Croats, Bosnian Muslims, and Kosovar Albanians, demonstrating the court's commitment to fairness. The ICTY has charged more than 160 persons, including soldiers, police and political leaders, and, most notorious, Serbian president Slobodan Milosevic. Sixty-four have been convicted or pleaded guilty, and 70 are currently on trial or still awaiting trial. The key objective of the court is to punish not only the ethnic cleansing committed by the Serbs but also torture, rape, murder, and various other war crimes. The ICTY was one of the first war crimes tribunals to recognize and punish rape as an instrument of war crimes, and it made a major contribution to customary international law in this area.

Rwanda

In 1994, a violent ethnic cleansing took place in Rwanda. Over 100 days, Rwandan Hutus systematically tortured and killed between 800,000 and 1 million Tutsis and moderate Hutus. National political leaders, mayors, the military, and the police were involved in many ways. Men, women, and children were slaughtered throughout the country, but the international community was reluctant

to get involved and waited more than a month to intervene.

After the majority of the violence was over, more than 2 million Hutus fled Rwanda, anticipating swift retribution. The United Nations established the International Criminal Tribunal for Rwanda in 1994. The tribunal, like the ICTY, has jurisdiction over genocide, crimes against humanity, and war crimes. Almost 70 cases have already been completed, with more than 40 convictions or guilty pleas. Another 6 cases are still in progress or awaiting trial. The International Criminal Tribunal for Rwanda was also one of the first international tribunals to recognize rape as a crime of genocide and a war crime.

Afghanistan and Iraq

After the events of September 11, 2001, the United States prepared to retaliate against those involved. Intervening in Afghanistan in late 2001, the objective was to not only defeat al Qaeda but also remove the Taliban from power. To defeat the Taliban, the United States needed allies, sometimes allying with groups that had questionable records with human rights. Although a new government was established in Afghanistan in 2002, the Taliban remained a strong fighting force, assisted by fighters in Pakistan.

There has been controversy about U.S. and coalition methods in Afghanistan. While transporting captured Taliban fighters, Northern Alliance forces overpacked container trucks, and 200 prisoners died. Some public figures around the world have also criticized American detention centers in Afghanistan. The use of torture and other abuses at these facilities has been debated, especially since the International Red Cross is not allowed access to many facilities.

At the same time, the United States faced another enemy in Iraq. In 2003, U.S. forces swept into Iraq. Within 30 days, Baghdad was captured. The low number of American troops and destabilization of the Iraqi government made it easy for insurgents to fight during the next stage of the war. The fighters wore no uniforms, had no chain of command, and hid among the population, especially in religious sites normally protected under international law. Anticoalition forces employed tactics to inflict maximum pain on both American troops and Iraqi civilians. The use of improvised explosive devices, designed to inflict maximum pain, grew exponentially. These methods clearly violated the laws of war.

As coalition forces grew increasingly frustrated with the insurgency, a number of questionable incidents occurred that resulted in trials by court-martial. In 2005, two dozen Iraqi civilians were murdered in Haditha, resulting in four U.S. Marines being charged with murder and four officers being charged with dereliction of duty for not reporting the incident. In Abu Ghraib, military prison guards were seen humiliating and using harsh techniques on Iraqi prisoners to extract information.

The United States has come under fire internationally for these incidents, among others, and has tried to quickly investigate and charge soldiers who commit crimes. Many military members have been tried and convicted under the Uniform Code of Military Justice (for breach of duty, assault, murder), however, instead of being charged with

crimes of war. As of 2005, more than 300 cases of detainee abuse have been investigated by the army in Afghanistan and Iraq, with 20% of those cases resulting in a detainee's death.

U.S. View on War Crimes

In 1996, the United States passed the War Crimes Act to integrate grave breaches and other war crimes under the Geneva Conventions into federal law. Although the act relates to crimes committed by or against a U.S. national, the main goal of the War Crimes Act was to prosecute offenses against Americans. The military has historically disciplined soldiers through the use of trials by courts-martial. Due to the increase in claims of prisoner abuse arising from Afghanistan, Iraq, and Guantanamo Bay, focus has been brought on American actions throughout the world. Currently, a serviceperson could be charged by a court-martial for a breach of the Geneva Conventions, without mention of war crimes. Because the War Crimes Act and federal antitorture statute prohibit use of the death penalty, military members cannot be charged under either statute in a court-martial where the action resulted in the death of the victim. To address the rise in crimes committed by service persons, the military released a new Army Field Manual in September 2006, instructing military and Department of Defense civilians to comply with the Geneva Conventions, especially avoiding grave breaches. The new manual also describes prohibited interrogation methods and provides instructions to disobey orders to commit illegal acts and to report violations immediately.

An agreement between the Departments of Justice and Defense allows most military members who commit crimes to be prosecuted by the Department of Defense. It is likely that a person convicted of a crime by the military cannot then be charged with a war crime under federal law for the same act due to the prohibition of double jeopardy. Another issue of concern is that the military cannot court-martial former military members, even if their crimes were committed during their service. Some critics urge change within the military and justice systems to avoid these circumstances and allow the United States to prosecute (and label) perpetrators of war crimes throughout armed conflicts.

Experts also reveal that the enforcement of military law in the United States generally focuses

Source: Associated Press.

on soldiers lower in the chain of command. In the most publicized cases from Vietnam and Iraq, most convictions in courts-martial have been of enlisted personnel or noncommissioned officers. Although investigations are occasionally started of those higher in the chain of command (My Lai, Abu Ghraib), many officers have been acquitted of charges or receive nonjudicial reprimands. Critics question these results and argue that treating soldiers involved in war crimes as “a few bad apples” limits the ability to correct problems higher in the chain of command.

Another area of controversy for the United States has been the ICC. The United States opposed the powers and jurisdiction given to the court, and some maintain that joining the ICC would violate the Constitution. Although the treaty was signed under the Bill Clinton administration, the George W. Bush administration “unsigned” the Rome Statute, fearing prosecution of American servicemen. The Obama administration is currently reengaging with the court. The United States is currently supporting the prosecution of leaders of the Lords Resistance Army in Uganda and has also spoken in support of prosecutions in Kenya and Sudan.

CRUISERS, NAVAL

By definition, a cruiser is a naval war vessel that is smaller than a battleship and larger than a destroyer. Cruisers have served a number of different purposes since their inception, including commerce raiding, air defense, and shore bombardment. Today, cruisers are capable of engaging enemies on land, sea, or air using advanced weaponry and technology. This entry discusses the history of cruisers and describes the features and missile systems of contemporary cruisers.

History

In the past, the word *cruising* was used to describe the mission that a sailing vessel was to undertake. These “cruising” missions would be anything from commerce raiding, to scouting, to protection of other ships. Until the mid-19th century, the predominant cruiser type was known as a frigate. These sailing ships were lightweight and fast, designed to go long ranges quickly. They employed only one deck gun and were used primarily as scouts and interceptors.

Following the obsolescence of sailing vessels as a weapon of war, cruising vessels maintained their place in world navies; however, their scope was substantially increased. These new steam-powered cruisers were larger than their predecessors and could allow heavier gun armament. Steam power also made it possible for the creation of ironclad ships, whose hull was reinforced with iron sides. By the late 19th century, ironclad ships were being built and deployed by the world’s powerful navies, including the United States and Great Britain. It was not long after the introduction of iron that engineers discovered the possibilities of steel for warships. Steel had the obvious advantage over iron in that it was lighter. Navies were able to utilize steel to increase the size, speed, and firepower of warships. This had the effect of confusing the distinction between battleships and cruisers, for the new cruisers began to mirror the battleships of the past.

By the early 1900s, heavily armed and armored battle cruisers emerged in naval fleets, accompanied by light cruisers, which were necessary to protect the larger vessels. The London Naval Treaty of 1930

established clear definitions of light and heavy cruisers, dictating that any ship with guns of 6.1-inch caliber or more was to be called a heavy cruiser. Heavy cruisers typically had 8-inch caliber guns and began active service following World War I. Prior to World War II, construction began on anti-aircraft cruisers; however, following World War II, it became evident that large ships were little match for advanced aerial power. This led to the dissolution of large-scale naval warfare as it had been known. Only the United States, Russia, and Peru currently have cruisers on active duty, indicating that the time of cruiser-dominated navies has most likely come to an end.

The Contemporary Period

The United States has 22 *Ticonderoga*-class guided missile cruisers in active service. Generally 567

feet long, the class is small and quick, topping off at 32.5 knots. The *Ticonderoga*-class cruiser was first deployed in 1983 and is equipped to combat air, sea, and land forces using advanced radar technology and a vertical launching system that can fire multiple missile types. Tomahawk cruise missiles for long-range warfare, surface-to-air missiles, and undersea missiles for submarine warfare make the *Ticonderoga*-class cruiser a powerful naval weapon. The U.S. Navy is currently undergoing a phase of upgrade and restoration of the *Ticonderoga* class, making improvements to the radar and weapons systems.

The Aegis Combat System is responsible for the strength of the U.S. Navy. Literally meaning “shield” in Greek, Aegis combines the most up-to-date radar technology with the most advanced missile systems available. Using radio frequencies, the Aegis system

The *Ticonderoga*-class cruiser USS *Mobile Bay* (CG 53) leads the *Oliver Hazard Perry*-class frigate USS *Curts* (FFG 38) and the *Arleigh Burke*-class destroyer USS *Russell* (DDG 59) in formation off the coast of southern California.

is able to guide multiple missiles to multiple targets simultaneously. The Aegis Ballistic Missile Defense System is used to defend friendly targets from enemy missiles. Aegis technology is currently used by the United States, Spain, Australia, Norway, and Japan; however, only the United States uses the technology on its cruisers.

The Russian *Kirov*-class cruiser is the largest cruiser in active service. The giant *Kirov* class, 827 feet long, mirrors a battleship of World War II, earning it the distinction of a modern battle cruiser. The *Kirov* class features a nuclear-powered engine that propels the gigantic vessel to 32 knots. The first was originally deployed in 1980; however, there is only one newer model currently in operation. The *Slava*-class cruiser is Russia's 612-foot-long cruiser capable of going to 32 knots. The collapse of the Soviet Union resulted in only three ships being completed. The final class of cruiser still in Russian service is the *Kara*. The *Kara* class has been in service since 1971

and is a guided missile cruiser. The *Kara*, 568 feet long, reaches 32 knots using a gas turbine engine. There is currently one *Kara* class cruiser in active service.

The Peruvian navy has one *De Zeven Provinciën*-class cruiser in active service. Originally launched in 1941, the *Almirante Grau* is the oldest cruiser currently serving. Despite its age, the cruiser is capable of speeds of 32 knots. The ship was sold to Peru in 1973 by the Royal Netherlands Navy.

Recent Conflicts

Nine *Ticonderoga*-class cruisers were deployed in Operation Desert Storm, beginning in 1991. They were largely responsible for discouraging any air defense by the Iraqi armed forces, allowing for a successful ground campaign. Following Operation Desert Storm, the U.S. Navy decommissioned all non-Aegis cruisers. Operation Iraqi Freedom,

beginning in 2003, featured 11 *Ticonderoga*-class, Aegis-operating cruisers.

CUBA

Located in the northern tier of the Caribbean Sea with a population of 11.5 million (according to a July 2010 estimate), in terms of population Cuba ranks approximately in the middle of 20 Latin American nations occupying the hemisphere. Measured by landmass, the island occupies approximately as much territory as the state of Ohio. However, statistics aside, Cuba's most notable distinction in modern history has been its significant influence on Latin America, the United States, and the world. This entry discusses the history of Cuba, focusing on its revolutions and its relationship with the Soviet Union and the United States.

Cuba has been governed by a one-party communist system since Fidel Castro seized power in 1959. Due to Castro's failing health, his brother Raul replaced him as president and commander of the Cuban military in February 2008. Raul Castro possesses a "practical, no-nonsense style" that is in marked contrast to his brother's more dogmatic approach to domestic and foreign affairs.

For most of its history, Cuba's economy has been an appendage of greater powers: first Spain, then the United States, and then the Soviet Union. Under Moscow's tutelage, agriculture, a traditional economic mainstay of the island, recorded steady growth in the 1970s and 1980s. However, with the collapse of the Soviet Union and the end of economic assistance, Cuban production dropped by as much as 40% between 1990 and 1998. In recent years, Havana has recovered some of this prosperity through (a) limited economic reforms,

(b) Venezuelan aid, and (c) new credit from communist China.

In the modern era, the Cuban military has been integral to the country's success, both as a symbol of the revolution and as a means to preserve Cuba during the Cold War. The Fuerzas Armadas Revolucionarias (FAR) arguably reached its peak in the 1980s, a time when it possessed nearly 1,000 main battle tanks and deployed thousands more troops abroad, particularly in Africa. Although militarily a fraction the size of the U.S. armed forces, the FAR and its various militia support units have been adequate to deter an American invasion of the island for more than half a century.

The Spanish-American-Cuban War and Its Aftermath

What drew Spain and, later, American attention to Cuba was the value of its many excellent harbors. Santiago, Havana, and Guantanamo all afforded excellent anchorages for commerce and naval defense. Both were especially important to U.S. strategists intent on expanding American influence at the end of the 19th century. Protected harbors offered the prospect of improved trade in sugar, cotton, copper, oil, and other raw materials. Naval installations also promoted political influence and the protection of key strategic interests, such as the Panama Canal.

Guantanamo Bay figured importantly in this equation. By virtue of the 1903 Cuban-American Treaty, the United States obtained "complete jurisdiction and control" over the area. For the next half-century, the U.S. Navy maintained Guantanamo as a base and coaling facility. Cuba renewed the lease on the base in 1934, and American ownership of the harbor was not challenged until the Cuban revolution in 1959.

Revolution and the Cold War

Fidel Castro's successful revolution against the Fulgencio Batista regime permanently changed Cuba's relationship with the world. In one shocking moment, a reliable American proxy was gone. Perhaps more important, the Cuban Revolution legitimized the use of violence to redress the inequities of capitalism and American power abroad. Castro became an inspiration for a cohort of revolutionaries, the so-called Generation of '59 in Nicaragua, as well as other countries that sought to use the Cuban

model to win back sovereignty and social justice in what they believed was a historical turning point. To this end, they borrowed Castro's and Ernesto "Che" Guevara's approach to revolutionary war, a methodology that proved deceptively simple in concept. During the 1960s, Guevara argued that "popular forces" could prevail against an organized military opponent. Moreover, he believed that revolutionaries did not have to wait until political, economic, or military conditions were ideal to overthrow a regime. Both assumptions reflected a fundamental faith in the depths of popular revulsion for Western capitalism and a belief that political discipline would be adequate to shape revolution. Although history would prove these assumptions to be tragic mistakes, particularly for Guevara, contemporary conventional wisdom saw Cuba as only a starting point for a new order in Latin America.

What gave this assumption credence was Soviet sponsorship of Cuba. At the start of the 1960s, Moscow essentially underwrote the Cuban economy and provided Havana with massive military assistance. When Castro entered the Soviet sphere of influence, what had been a relationship defined by American hegemony took on all the worst connotations of Cold War conflict between two superpowers. This transition was clearly evident during the American-sponsored exile invasion at the Bay of Pigs in 1961 and the more dangerous Cuban Missile Crisis a year later.

America's long-term policy response to the new Soviet-Cuban axis later appeared as the Alliance for Progress, a U.S.-initiated assistance program built around the premise that stability and security would undercut support for radicalism in the hemisphere. Fearful that the communist "beachhead" in Cuba would spread, the John F. Kennedy administration and its successors invested enormous sums in economic development and military assistance. Ten years and billions of dollars later, the American-led effort was successful, but at the cost of militarizing the hemisphere. As the 1960s closed, military-led or -dominated governments became the rule rather than the exception in Latin America.

Blocked at home, Cuba expanded its support of revolutions abroad, particularly in Africa. In practice, Cuban military action evolved from providing revolutionary cadres, to fostering popular rebellion, to direct intervention by conventional units. During the 1970s and 1980s, Havana deployed as many as 75,000 troops to Angola and Ethiopia alone. The

Cuban military was rewarded for its efforts. In contrast to the U.S. experience in Vietnam, the FAR won the three wars—Angola (1975–1976), Ethiopia (1977–1978), and Angola (1987–1988)—that it fought in the Third World.

When Cold War tension returned in the 1980s, it seemed reasonable to conclude that Cuba was a danger by virtue of its own military power and utility as a Soviet proxy. The Ronald Reagan administration would stress both roles, especially with respect to Cuban influence in Central America. Successive administration intelligence estimates and diplomatic "white papers" emphasized Havana's hand in El Salvador and Nicaragua during the 1980s. Counterbalancing the Cuban threat became a primary justification for American support of Nicaraguan Contras and regional military intervention in countries such as Honduras and Grenada.

Cuba and the New World Order

The collapse of the Soviet Union in 1991 drastically changed Cuba's status versus the United States and the world. For Havana, the failure of Soviet communism translated into a dramatic decline in economic subsidies and military equipment. Consequently, the early 1990s witnessed a Cuban military that did not so much decline as plummet in size and capability. Between 1991 and 1995, the number of personnel under arms decreased from 297,000 to just 70,000. A general withdrawal of military forces abroad followed thereafter. The Cuban military presence in Africa and Latin America first dwindled and then vanished. Havana also retrenched its support for overseas revolutions. To Farabundo Martí National Liberation Front guerrillas in El Salvador who had enjoyed Cuban aid for decades, the Castro government announced in 1991 that its future solidarity would be limited "to the political level."

The U.S. approach to this new reality was less predictable. Rather than capitalize on the worldwide dissolution of communism, Washington, D.C., did not attempt to overthrow Castro at what seemed an opportune moment. Instead, the George H. W. Bush and Bill Clinton administrations indulged in attempts at confidence building, particularly through military cooperation. As a result, the Pentagon regularly notified the FAR of military exercises conducted at Guantanamo Bay. At sea, the two respective navies also began to coordinate operations around the island.

This policy proved especially useful in the early 1990s, when tens of thousands of Cubans and Haitians fled to the United States seeking economic and political sanctuary. By 1995, a deliberate effort to return refugees transformed Guantanamo Bay into a temporary holding area that eventually contained as many as 50,000 persons. Although Cuban citizens located in Guantanamo were eventually allowed entry into the United States, in a major policy reversal the Clinton administration announced that it would return future refugees back to the Cuban authorities.

Whatever positive steps occurred in the 1990s were later offset by military clashes at the end of the decade. Tension rose significantly in February 1996 when a Cuban jet fighter destroyed two civilian aircraft piloted by members of the exile group Brothers to the Rescue. Although the group had clearly violated Cuban airspace, the deaths of the crew members provoked worldwide protests and demonstrated the vulnerability of rapprochement. The September 2001 arrest of Ana Montes, a Cuban spy who had infiltrated the upper ranks of the U.S. Defense Intelligence Agency, was perhaps even more ominous, illustrating the fact that parts of the Cold War were not over.

Since the September 11, 2001, attacks on the United States, the so-called Global War on Terrorism has again altered U.S.-Cuban relations, particularly one key component of it. Guantanamo Bay underwent its most recent evolution from a refugee center to a prison for terrorists and terrorist suspects. Declassified documents have since revealed that the George W. Bush administration deliberately chose the base because officials believed that it would be outside the jurisdiction of American courts, an assumption that the U.S. Supreme Court proved false in June 2004.

For nearly a decade, Guantanamo has become synonymous with global criticism of U.S. counterterrorism policy. The Bush administration's claim that detainees could provide useful operational intelligence was counterbalanced by a losing war over public opinion. Not surprisingly, when the 2008 presidential campaign unfolded, the status of the detention facility became a major political issue. When Barack Obama ran for president, his promise to close the facility resonated with the view of the 58% of Americans polled by Angus Reid in May 2008, who said that Guantanamo had increased anti-American sentiment around the world.

Translating that campaign promise into action has proven more difficult for the Obama administration. As of this writing, the facility remains in operation.

Cuba in the 21st Century

As the U.S. Global War on Terrorism winds down, discussion has again returned to U.S.-Cuban relations and, more specifically, the future of the country after Castro. As the transition of official power to his brother Raul indicated, meaningful changes await Castro's death and a postcommunist Cuba. The real dilemma for policymakers is how best to ease this transition. Ironically, the answer may come from the Cuban military.

Twenty-first-century Cuba is a restive place. The population is tired of underdevelopment, corruption, and the seemingly impossible prospect of change. Massive layoffs from public sector jobs in September 2010 likely only compounded antigovernment sentiment.

As discontent grows, the government will probably revert to familiar form and use the formidable power of state coercion against its citizens. However, in this predictable act might lie a larger story. The Cuban security forces, particularly the military, retain a greater degree of cohesion than most other national institutions. Although reduced in size, the military remains well disciplined, trained, and reliable. Perhaps more important, the military is also one of the more respected elements in Cuban society. Like the Sandinista armed forces in Nicaragua, the Cuban military is largely untarnished by charges of corruption. Bolstered by public faith, it will likely have an important voice in shaping Cuba's future after Castro.

CULTURAL PROPERTY AND HERITAGE

Both cultural property and cultural heritage have a variety of legal definitions. Generally, however, cultural property, also known as tangible cultural heritage, is defined as movable or immovable property of great importance to the culture of people, such as works of art and monuments. Cultural property is afforded greater protection than other property. Article 27 of the 1907 Hague Convention Respecting the Laws and Customs of War on Land and Article 1 of the 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict elucidate the main definitions of cultural property for military purposes.

The term *cultural heritage* is broader than *cultural property*, can be tangible or intangible, and is more commonly accepted today, especially in international circles, than is the more antiquated, traditional term *cultural property*. However, the term *cultural property* is still frequently used when discussing the 1954 Hague Convention and military usage and will be used as such in this entry.

Cultural property has special status and risk in armed conflict. The U.S. military is subject to multiple provisions that regulate the military's conduct toward cultural objects and edifices. These provisions have evolved over time in response to military developments to reduce harm toward cultural property in armed conflict. This entry describes U.S. military interaction with cultural property from the Civil War to the two Gulf Wars and examines the

impact of the Hague Conventions that pertain to cultural property.

Special Status of and Risk Toward Cultural Property

Cultural objects and edifices have special status so that they can be better protected against the risks inherent in armed conflicts. Cultural objects and structures have greater protection than other property for multiple reasons. First, each is unique: There is only one of its kind, and it cannot be replaced. Second, the value of cultural property is more than financial. Cultural objects and edifices can have cultural, historical, or religious significance to a group. This significance can result in emotional and psychological connections to the work, which can make it a target in armed conflicts. Furthermore, damage to the cultural property of one state is frequently viewed as harmful to the international community.

Cultural property is at risk in armed conflicts from looting, pillaging, and destruction. Cultural objects are susceptible to looting and pillaging because of their intrinsic value and potential for realizing cash on the black market. Cultural property is also at risk for destruction in armed conflicts because of the damaging nature of weapons used in the conflicts.

Moreover, in armed conflict, cultural property is in jeopardy of the enemy taking or harming the cultural objects or structures to punish the state or group with which it was affiliated. The cultural objects can be taken as trophies for the possessing state to flaunt. Cultural property can also be destroyed, seized, or modified to alter historical perception of the state or group affiliated with the cultural objects or structures. A conquering state or group can take or modify the cultural property of a vanquished state or group to emotionally and psychologically suppress the vanquished state or group and more easily integrate it into the conquering entity's culture.

U.S. Military Interaction With Cultural Property

Civil War

Lieber Code

President Abraham Lincoln had Francis Lieber, professor at Columbia University, draft a legal

military code for the Union Army to regulate conduct in war. In 1863, Lieber released the Instructions for the Government of Armies of the United States in the Field (the “Lieber Code”). Key provisions in this code that address cultural heritage include Articles 31, 34, 35, and 36.

According to Article 31, the conquering state could seize public movable property and revenue from the opposing state’s real public property. Under Article 34, property belonging to entities that were devoted to charity or knowledge, including churches and museums, were not considered public property under Article 31. Accordingly, these movable properties and revenue from real properties were not subject to seizure even if such property belonged to the state. However, the property could be taxed or used if needed by public service. Under Article 35, art was to be secured against all avoidable harm. According to Article 36, the conquering state could remove artworks belonging to the opposing party if the works could be removed without injury. The art was not to be harmed, sold, given away, or privately appropriated. Title was to be determined by the subsequent peace treaty.

The military necessity exception limited the legal requirement not to harm cultural property. The military necessity exception provided flexibility to accommodate the practicalities of armed conflict and was applied in a multitude of situations when the necessity of the situation permitted a military actor to proceed without fault. Article 14 of the Lieber Code defined the military necessity exception as “the necessity of those measures which are indispensable for securing the ends of the war, and which are lawful according to the modern law and usages of war.” Article 15 of the Lieber Code noted that military necessity permitted destruction of enemy property.

March to the Sea and the Carolinas Campaign

Much cultural heritage was destroyed in the Civil War, particularly in the South. For example, in 1864, General William T. Sherman commenced his “March to the Sea,” which left a swath of destruction that still leaves a void in the cultural landscape of the southern United States. A Union Army general in the Civil War, Sherman seized and burned Atlanta before commencing the 300-mile march to Savannah, Georgia, and then the Carolinas. Sherman led more

than 60,000 soldiers who liberally foraged, burned, and destroyed property and objects in the troops’ path pursuant to his methods of total war, thereby devastating the cultural landscape. A plethora of southern cultural heritage was obliterated by these troops during his military campaigns.

1899 Hague Convention With Respect to the Laws and Customs of War on Land

The 1899 Hague Convention With Respect to the Laws and Customs of War on Land is a set of provisions that regulate war on land between belligerents. The United States signed the 1899 Hague Convention on July 29, 1899, and the Senate ratified it on April 9, 1902. Key provisions relating to cultural heritage include Articles 23, 27, 28, 47, and 56.

Under Article 23, seizure or destruction of enemy property is not permitted unless necessity requires it. Under Article 27, religious and art-based structures are not to be harmed in sieges and bombardments to the extent that is feasible unless they are being misused for military purposes. These structures are to be visibly marked and the enemy notified. Pillage is prohibited during hostilities under Article 28 and when the military has authority over the territory under Article 47. Pursuant to Article 56, state religious, educational, and art properties are treated as private property, and no such properties, historical monuments, or artworks are to be seized or destroyed when the military has authority over the territory.

1907 Hague Convention Respecting Laws and Customs of War on Land

The 1907 Hague Convention Respecting the Laws and Customs of War on Land provides protection for broad categories of cultural heritage. The United States signed the 1907 Hague Convention on October 18, 1907, and the Senate ratified the 1907 Hague Convention on November 27, 1909. Key provisions relating to cultural heritage include Articles 27 and 56.

Under Article 27 of the 1907 Hague Convention, parties to the convention are not to harm historic monuments or buildings devoted to art or religion to the extent that is feasible. The structures are to be marked and the opposition notified before the armed conflict. Moreover, under Article 56 of the 1907 Hague Convention, state property dedicated

to religion or art is accorded the same protection as private property.

Two primary exceptions limit the legal requirement not to harm historic monuments or buildings devoted to art or religion. These exceptions are the military necessity exception and the misuse of cultural property exception. Article 23(g) of the 1907 Hague Convention elucidates the military necessity exception noting that, while it is improper to take or destroy the opposition's property, infringement on property is permitted if it is "imperatively demanded by the necessities of war."

Under the misuse of cultural property exception, protection afforded under Article 27 is removed if the structure is used for military purposes.

Treaty on the Protection of Artistic and Scientific Institutions and Historic Monuments

The Treaty on the Protection of Artistic and Scientific Institutions and Historic Monuments ("Roerich Pact" or "Washington Pact") provides for marking and protection of immovable cultural heritage in the Americas. The United States signed the Roerich Pact on April 15, 1935, and the Senate ratified the Roerich Pact on July 13, 1935. Nine other countries are party to the Roerich Pact. These countries include Brazil, Chile, Colombia, Cuba, the Dominican Republic, El Salvador, Guatemala, Mexico, and Venezuela. The purpose of the Roerich Pact is to promulgate a flag that demarcates immovable cultural property to be respected and protected during peace and war. Under Article 1, protected works include "historic monuments, museums, scientific, artistic, educational and cultural institutions" as well as the personnel of the protected works. The designated flag consists of a white background with a triple red sphere circumscribed by a red circle. The misuse exception removes this protection if the edifices are used for military purposes.

World War II

A plethora of cultural heritage was misappropriated, damaged, and destroyed in Europe during World War II. Many cultural objects still have not been returned to the original owners or heirs. To ameliorate the harm to cultural heritage, the military worked with museum and art history professionals to develop a list of sites that were not to be harmed if possible and secured artworks as the military forces

advanced into an area. This collaborative group was called the Monuments, Fine Arts and Archives.

States drafted the 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict as a result of the large-scale misappropriation of and injury to cultural heritage. While the United States signed the 1954 Hague Convention on April 14, 1954, the Senate did not ratify the convention until March 13, 2009.

There are two protocols to the 1954 Hague Convention. The First Protocol to the Convention, which addresses portable cultural property, was drafted in 1954. The Second Protocol, which was drafted in 1999, responded to the international community's experiences with and shortcomings of the 1954 Hague Convention. The United States has not signed or ratified either protocol at this time.

Gulf Wars

While steps were taken to protect cultural heritage during the Iraq War in 2003, cultural objects were misappropriated and harmed during the armed conflict. For example, the U.S. military compiled a no-strike list in conjunction with museum and art history professionals to avoid harming cultural heritage. However, military bases were constructed on the historic sites of Ur, Babylon, and Samarra, damaging the sites and resulting in international criticism. Moreover, museums, archives, and libraries were looted and destroyed by third parties in Iraq, which prompted a public outcry. The most notorious of these was the Iraq Museum in Baghdad, which housed thousands of cultural objects. The U.S. military investigated and sought return of cultural objects that were looted. Many objects are still missing.

The public condemnation of the construction of military bases on the historic sites and looting of cultural objects led to an evaluation of the U.S. military's practices toward cultural heritage and several calls for the United States to ratify the 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict.

1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict

The 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict is

one of the main conventions regulating the U.S. military's interactions with cultural property. The Senate ratified the 1954 Hague Convention on March 13, 2009. The 1954 Hague Convention has a preamble, 40 articles, and Regulations for the Execution of the Convention for the Protection of Cultural Property in the Event of Armed Conflict. Within the 1954 Hague Convention, Chapter 1, Articles 1–7, explains the regime for the general protection of cultural property. Chapter 2, Articles 8–11, outlines the elevated protections and requirements for a small number of specially protected cultural properties. Chapter 3, Articles 12–14, details the transport of cultural property. Chapter 4, Article 15, discusses personnel who protect cultural property. Chapter 5, Articles 16 and 17, describes the emblem that should mark the cultural property, and thereby notify opposing military forces of the protected status of cultural property, and the use of the emblem. Chapter 6, Articles 18 and 19, outlines the scope of the application of the Hague Convention. Chapter 7, Articles 20–28, explains the execution of the Hague Convention. The final provisions, Articles 29–40, discuss practical matters such as the signing and ratification of the 1954 Hague Convention and its relation to previous conventions. The regulations primarily deal with the procedures used to apply the 1954 Hague Convention.

The designation of cultural property under Article 1 of the 1954 Hague Convention is limited to property “of great importance to the cultural heritage of every people” and the buildings that contain such objects. This is the threshold for the cultural property to receive protection under the 1954 Hague Convention. The 1954 Hague Convention applies before an armed conflict commences, during an armed conflict, and during partial or total occupation under Article 18.

Parties have legal requirements before an armed conflict arises under the 1954 Hague Convention. Under Article 7, the future invading state and future invaded state have legal requirements to instill respect for cultural property and provide instructions to ensure compliance with the 1954 Hague Convention before an armed conflict. Furthermore, under Article 3, the future invaded state has an additional legal requirement to prepare for the protection of the cultural property within the state against foreseeable harm. Cultural property is to bear a distinctive emblem, which consists of blue and white

triangles and squares. However, a state's failure to safeguard cultural property against foreseeable effects of armed conflict does not relieve the invading state of the duty to respect cultural property.

During the armed conflict, the invading state and the invaded state have legal requirements toward cultural property to not harm cultural property, not use cultural property in a way that would expose it to harm, and stop state actors, and possibly third parties, from stealing, misappropriating, pillaging, and vandalizing cultural property unless military necessity exists or, potentially, if the opposition misuses the cultural property. Under Article 4(1), the 1954 Hague Convention requires that parties respect cultural property by not harming the property. The U.S. *Law of War Deskbook* reiterates the obligation to not attack cultural property. Cultural property receives additional, special protection if it is listed on the International Register, which is maintained by the United Nations Educational, Scientific, and Cultural Organization.

The 1954 Hague Convention also extends a legal requirement to prevent and stop theft and harm to cultural property under Article 4(3), which states that parties will “undertake to prohibit, prevent and, if necessary, put a stop to any form of theft, pillage or misappropriation of, and any acts of vandalism directed against, cultural property.” Discrepancies in views of whether states have a legal requirement to protect other states' cultural property from third parties under the 1954 Hague Convention exist. Article 4(3) does not clarify who the parties must stop from stealing, pillaging, misappropriating, and vandalizing cultural property or when the legal requirements apply. Some argue that states must prevent their own soldiers from misappropriating or damaging cultural property, while others argue that states must prevent all persons, including third parties, from misappropriating or harming cultural property.

One exception to the duty not to harm cultural property is the military necessity exception. Under Article 4(2) of the 1954 Hague Convention “any use” that would harm the cultural property is permitted if required by military necessity. There is a higher burden to invoke military necessity for specially protected cultural property under Article 11.

A second, potential exception that limits the legal requirement not to harm cultural property is the misuse of cultural property exception. Misuse of cultural

property can include using the cultural property as a shield or using it for military purposes. However, the U.S. military has previously balanced the value of destruction of legitimate targets against potential damage to cultural property that was being misused.

All parties have legal requirements toward cultural property during occupation under the 1954 Hague Convention. The occupying state has a legal requirement to support the occupied state in safeguarding and preserving cultural property to the extent feasible and to preserve cultural property to the extent feasible if the competent national authorities cannot do so under Article 5. The states might also have a legal requirement to comply with Article 4 during occupation. Under Article 4, the states would have legal requirements regarding cultural property during occupation to not harm cultural property, not use cultural property in a way that would expose it to harm, and stop state actors, and possibly third parties, from stealing, misappropriating, pillaging, and vandalizing cultural property.

Occupied states also have legal requirements toward cultural property during occupation. Under Article 5(1) of the 1954 Hague Convention, the occupied state has the primary duty to protect and preserve its cultural property. Article 5(2) mitigates the difficulty of this legal requirement by stating that the occupying state has a duty to preserve cultural property to the extent feasible if the occupied state is unable to preserve its cultural property.

Conclusion

The definition of cultural heritage and cultural property, and the military's obligation toward them continues to evolve as the world grows more interconnected and the harm to one state's or group's cultural heritage reverberates through the international community.

CULTURE, MILITARY

Culture is most easily defined as the values, behaviors, norms, and artifacts that define how a social group interacts with the world. Like all groups, the military developed its own culture to achieve its mission. The armed forces of the United States share many elements of military culture, including basic training, hierarchical organizations, and promotion based on merit. The unique missions and orientations of each branch of the armed forces led each to develop its own culture that includes its mission, history, and traditions—its sense of self. The U.S. Air Force (USAF), U.S. Army, U.S. Marine Corps, and U.S. Navy (USN) have therefore developed unique cultures based on how they experience war, and that is the focus of this entry.

Elements and Tenets of Military Culture

Don Snider identifies four elements of military culture based on his understanding that fighting wars defines the beliefs, values, and behaviors that combine to form military culture. The first element of military culture is discipline, which encompasses behavior both in and out of uniform. Discipline allows individuals and a unit to function in the chaos

of combat, and during peacetime it helps ensure military readiness. A professional ethos forms the second element of military culture. In the United States, this ethos is formed not only by the dictates of the profession of arms but also by American ideals of liberty and equality, military subordination to civilian authority, and emphasis on national defense rather than aggressive war.

The final two elements of military culture are (1) tradition, in the form of ceremonies and etiquette, and (2) cohesion and esprit de corps. Ceremonies and etiquette, such as salutes, uniforms and insignia, induction, promotion, and retirement ceremonies, work to control anxiety by providing the outward semblance of order and solidarity among service members. These ceremonial components provide the outward symbols that enhance cohesion and esprit de corps. Cohesion is the connection individual soldiers feel to the members of their immediate unit, while esprit de corps refers to the larger institution the unit belongs to. Cohesion and esprit de corps are important indicators of morale and the soldiers' willingness to fight and their ability to face adversity.
